Supposing large and small bells to be equal in quality, and otherwise uniform in their proportions, the larger they are the smaller is the proportion of hammer required to elicit the sound; and if the same proportion of force were employed on large bells which can safely be used on small ones, the result would be certain to end in fracture. Not only must the proportionate force be smaller for large bells, but it must also be applied in a more gradual manner, because it is impossible to set large masses in motion so suddenly as small ones; in fact, the velocity of the blow might be so great as to carry away the portion struck, without moving the distant parts of the bell at all. To prove this, I need only recall a few well-known instances, such as that of a bullet, fired from a musket, having sufficient velocity to make a round hole through a pane of glass suspended by a thread, without either cracking the pane or causing it to oscillate; the cannon-ball having so great a velocity as to be turned aside by water as completely as though the sea were a solid; and the piercing of a deal board by a tallow-candle fired from a gun. In these instances the velocity of the blow is too great to allow the surrounding parts sufficient time to partake of the motion, whereas with a lower velocity the whole pane would have been shattered, the cannon ball would have entered the water, and the candle would have been flattened out on the board like a pancake; and with a still lower velocity the pane of glass would simply have been set swinging, without fracture, and the candle would have gently rebounded from the board without its symmetry being obliterated. One of the chief things to aim at in large bells is, therefore, to impart the force slowly, and they should consequently be allowed to swing freely, so as to recede with the hammer and prolong the duration of impact. This may be done, and some other practical objects secured at the same time, by suspending the bell so that it can oscillate freely in the plane of the blow, but in no other, and so converting it into a pendulum swinging in tolerably equal intervals; the time of its oscillation having been ascertained, the interval between the blows is so regulated that the bell is always making one of its return oscillations as the hammer descends to meet it, and thus the swing given to the bell by one blow is set against that caused by the next, and the two made to neutralise each other, so that the motion does not accumulate at all, and therefore the recoil spring is only required to keep the hammer at little more than the distance that would suffice for a stationary bell, whilst the forces are so balanced against each other that all strain is nearly removed from the bell-frame.

It is hopeless to expect that an equal volume of sound can ever be obtained from a clock-bell—which must of necessity be comparatively stationary—as from bells that are rung, and therefore swinging through many feet of space. The view is quite erroneous which supposes the difference to arise simply from the hammer striking the outside of the bell instead of the inside, as a clapper does; and its unsoundness was proved by a bell which we fixed up at Leicester, with two hammers, one striking the outside, and the other the inside, when the outside hammer really produced the most sound, and its fall had to be a little diminished, in order to make the two sounds equal. The true

cause is no doubt identical with that which produces the extra volume of sound when an accordion or concertina is swung about instead of being held stationary.

In bells, as in musical strings, there are certain points called nodes of vibration, which remain stationary whilst all the other parts are in motion. In strings the ends are fixed asunder, and the nodes of vibration therefore remain constantly at the same points on the string; but in a bell the two ends of the string may be said to be united, and the nodes of vibration to be at liberty to travel round the bell, and to occur occasionally at every point on its circumference. This will perhaps help us to explain the cause of one blow occasionally producing less sound than another, by supposing a node of vibration to be passing at the instant the hammer descends on the same point, and which would consequently have to generate another set of vibrations exactly antagonistic to those already existing.

The tone of the Westminster quarter-bells is of a decidedly musical character, and if the same musical type could be retained and combined with clear articulation, and the bells sound freely with only an average blow, a considerable advance would be made in the art of bell-founding. The fourth quarter-bell is a bad one, with a dull, leaden sound, and the tone is accompanied with a large number of "beats," arising from the different parts being out of tune with each other, and vibrating in unequal times, and which is owing either to imperfect proportions, unequal thickness all round, or unequal density of metal.

The Rev. William Taylor, who is nominally one of the referees for the Westminster bells, with limited powers of action, has informed me that he was at the pains of collecting and translating a large quantity of the most valuable information he could obtain from the Continent relative to the measurements and composition of foreign bells, but that very little advantage was taken by the designer of the Westminster bells, either of this information or of that collected by Professor Wheatstone. In addition to collecting information, Mr. Taylor has gone to the expense of making a number of experiments on bells, and it is therefore hoped that he will enrich this sterile field of inquiry by their general publication, when they may, perhaps, produce fruit under happier circumstances.

It is some satisfaction to turn from the Westminster bells to the structure which contains them, and witness the efficiency of the internal arrangements. The staircase, from bottom to top, is very wide for a bell-tower, and has landings conveniently arranged as resting-places. The bell-chamber is, perhaps, the most spacious in Europe, compared with the number and size of the bells it contains. The bell-frame combines strength with economy of material to a degree that enabled it to receive the disproportionately heavy hammer upon the bell without perceptible motion in itself; and the whole of this part, both in design and efficient execution, is really something pleasing to contemplate, and the pleasure will be shared by thousands of the public who will, in time to come, look down upon the bells from the iron gallery which has been so conveniently arranged for their use.

THE THAMES AND ITS IMPROVEMENT. TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—I have read with much interest the articles in the *MECHANICS' MAGAZINE* on this subject, and perfectly agree in the opinion given that the plans now in progress for metropolitan drainage will prove a most gigantic blunder, but as the local management (tinkers, tailors, &c., as *Punch* calls them), have it all their own way, they will go on to the end without doubt, when the rate-payers will wake up from their long lethargy, too late to recall the wasted and misapplied capital, which if it had been properly spent, would have diffused general benefit to all around, instead of adding to the evils by a perpetuation of Thames nuisances. These latter will not, however, be

moved by pouring in sea water through pipes to the Thames from Brighton, for the fact is certain (as proved by daily experience), that wherever salt water and sewage are mixed together the stench is horrible, and produces a sickening and depressing effect on all around. This can be seen and felt every day in the large salt-water pond called the Mill Dam, at Portsea.

I trust your powerful protest will be used in preventing any addition to the great metropolitan nuisance; and which evil, if it cannot be cured must be endured, as long as men will quietly submit to have wrong principles carried out.

Yours respectfully, W. AUSTIN.

[We would remind Mr. Austin that in the plans to which he doubtless alludes, the object is to drive out the polluted water of the Thames by means of a quantity of sea water poured in above it,—and not to mix the two waters. Whether considerable admixture would be a necessary concomitant of these plans is, of course, a question to be considered.—Eds. M. M.]

UNSINKABLE SHIPS.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."
Bury, near Gosport, 16th Nov., 1859.

GENTLEMEN,—With reference to the article in the number of your magazine of the 4th Nov., respecting "Unsinkable Ships," I enclose you a specimen of wood which I obtained at Madagascar about ten years ago, which you will perceive is of extraordinary lightness, and appears quite to come up to the requirement suggested by Mr. Atherton for the filling in of his unsinkable ships.

The piece of wood which I have sent to you measures $1\frac{1}{2} \times 1\frac{1}{2} \times \frac{1}{2}$ inches, and weighs 20 grains, whereas a piece of well-seasoned fir of the same dimensions weighed 150 grains!

I regret that I cannot recollect enough about the tree from which this wood was obtained to give much information about it, but I believe it was a specimen of a cactus, the stem being about six or eight inches in diameter. The tree abounded about the Bay of Antongue, from whence I obtained the piece of wood now sent. It appears admirably adapted for ships, boats, &c. Probably you will be so kind as to pass the specimen on to the Society of Arts, as it may be viewed with interest after Mr. Atherton's paper. I am, &c.,
H. D. P. CUNNINGHAM.

[The specimen has been forwarded to the Society of Arts.—Eds. M. M.]

LIFE-BOAT SERVICES.

It appears that during the present year the life-boats of the Royal National Life-boat Institution have at various points of our coasts been actively called into operation on fifty-six different occasions. The result has been that one hundred and thirty-four lives have been saved off twenty-three wrecks, besides assisting five vessels safely into port. On twenty-three occasions it happened that when the life-boats had put off in reply to signals of distress, the vessel either got out of danger or the crew was rescued by other means. Again, crews assembled several times to give assistance, but were not required to put off to sea. For these valuable services the crews were paid nearly 600*l*. Nearly all these services took place in stormy weather and heavy seas, and often in the dark hour of the night; and yet not a single accident happened to either of the life-boats or to one of the gallant fellows who had put off in them. On these and on occasions of quarterly exercise, these life-boats were manned probably by no less than 4,000 persons. Such practical proofs as these of the great value of the Royal National Life-boat Institution in a maritime country like ours, cannot possibly be over-rated, and surely it has the highest claims on our support; and the more we hear of its operations on various parts of the coast, the more we feel urged to press its claims on public notice.—Contributions in aid of this philanthropic cause may be paid into any of the Bankers of this town, or sent direct to the Secretary of the National Life-boat Institution, 14, John Street, Adelphi, London.

NOTICES.

The letters of Mr. De la Haye on unsinkable ships and rafts, of Mr. Chaverton on steam-ship economy, and of Mr. Moy on sailing, are all in type, but we are reluctantly compelled to defer the publication of them until next week.

The *MECHANICS' MAGAZINE* will be sent free by post to all subscribers of $\text{£}1$ *ls.* 8*d.*, annually, payable in advance. Post Office Orders to be made payable to R. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5*l.* per line for any number of insertions less than 13; for 13 insertions, 4*l.* per line; and for 52 insertions, 3*l.* per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

[ADVERTISEMENT.]

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."
Scottish Central Railway, Locomotive Department,
Perth, November 21, 1859.

DEAR SIR,—Will you oblige me by inserting in your two next numbers that I do not claim the Originality of the Throttle Valve in the Blast Pipes in Locomotive Engines, as a means of retarding railway trains, though patented by me: for, since I did so, I have found it previously patented by Mr. RUDOLPH BOHMEN, of London, to whom any merit is due in introducing it in this country.

I am, dear Sirs, yours truly,

ALEX. ALLAN.

Our Weekly Gossip.

A WELL-INFORMED correspondent sends us the following statement respecting the Great Eastern's chain cables:—

London, Nov. 19, 1859.

GENTLEMEN,—Permit me to inform you that the quality of the iron employed in the chain cables of the Great Eastern was arranged by Mr. Lenox with Mr. Anthony Hill at the Plymouth Works. The construction of the cables rested likewise with him, and neither were dictated by the late Mr. Brunel, as implied in the letter of "Veritas" at page 831 of your last number, though no doubt conversations ensued upon the subject (after Mr. Hill received the order for the iron) between him and Mr. Brunel. I perhaps may, too, be permitted to mention that when discussing the size of cable to be used, Mr. Brunel energetically observed, "But we must not trust to one chain cable for holding such a ship; if she is driven to the necessity of applying her cables, three or four must be down at once." One alone has saved her on her first adventure.

STUBSIBER.

The prospectus has been issued of the London and Mediterranean Steam Company, with a capital of 450,000*l.* in $\text{£}10$ shares. The object is to establish a line between London and the principal commercial cities of Italy and Sicily, the success of which is considered to have been rendered certain by the results of experiments carried on for two years past. The company also rely upon obtaining great advantage from the adoption of Rowan's patent expansion steam engine for economizing fuel, which has lately attracted much notice from its operation in the Thetis screw steamer between Glasgow and Liverpool.

The paddle steamer Emperor, of 1,350 tons, the property of Messrs. Gee and Co., Hull, clears to-day at that port for Santander. She is chartered by the Spanish Government for the war service in Morocco, and is the first of a line of British steamers taken up in this country for the Spanish war, being the only paddle steamer specially engaged for superior service. The Emperor was the steamer selected to convey the staff officers out to the Crimea in the late Russian war, with the late Captain Christie as commodore, and was also appointed to be the flag and signal ship during the transportation of the British army from Baldjik Bay, near Varna, to Old Fort, previous to the battle of the Alma.

The following letter from Miss Isa Craig is in support of the object to which our first leading article of last week was directed:—

GENTLEMEN,—As you have called public attention to the subject of the employment of women, I beg to inform you that at a meeting of the council of the National Association for the Promotion of Social Science yesterday it was moved by Mr. G. W. Hastings, and seconded by the Hon. Arthur Kinnaird,

M.P., and carried,—“That the following be appointed a committee to consider and report to the council on the best means which the association can adopt to assist the present movement for increasing the industrial employment of women—the Right Hon. the Earl of Shaftesbury, the Hon. A. Kinnaird, M.P., Mr. E. Akroyd, Mr. Hastings, Mr. Horace Mann, Mr. W. S. Cookson, Mrs. Jansson, Miss Parkes, Miss Adelaide Proctor, Miss Boucherett, Miss Faithful, Miss Craig.” If you will kindly insert this letter in your columns it will greatly facilitate the object of the committee, which is to obtain information as to the channels already open to female industry, and as to the opening of others into which it would be desirable to direct it. As secretary to the committee, I shall be happy to receive any communication on the subject, and am, Sir, yours obediently,

ISA CRAIG.

Waterloo-place, Pall-mall, S.W., Nov. 17, 1859.

In an interesting letter from Mr. W. Gilmore, of Aylesbury, for two years surgeon-superintendent of the Royal Charter, we read:—"In very rough weather, with a head wind, she (the Royal Charter) laboured very much, and shipped a great deal of water, which made her a very uncomfortable ship for passengers, more especially the third class. I have very often seen the water knee-deep between decks, and in gloomy wet weather the main deck always leaked, supposed to be from the working and straining of the ship. Indeed, I have seen the boards of the deck working up and down like the keys of a piano, and the seams all of a mass of froth. This I have frequently pointed out to the captain and chief officer. I have also seen and felt her vibrate from bow to stern like a fishing rod, and often, when great press of mail was on her, have heard the rivets rattling in her sides, but I must say never saw her leaking in any part only once, and that was a small one in her bows. These things I have more particularly noticed during the last two voyages before this unfortunate one, as I am thankful to God that I was not in her the last one. During these two voyages, but more especially the last one, I lost much of the confidence I had in her, and determined to leave her as soon as I could get a chance of settling down on land; in fact, such was my anxiety to get out of her, that I had a presentiment, which haunted me continually, that sooner or later she would be lost."

The *Courrier des Etats Unis* publishes the following:—"Mr. Millard Filmore, ex-president of the United States, has just addressed a letter to M. Rollin Germain, asking him to explain at a public meeting the principles on which this ingenious inventor believes he can build a steam-ship which will make 100 miles in an hour, and whose strength will resist all the fury of the ocean and even the shock of a collision with other vessels. When this steamer is laden with passengers, freight, provision, and coal for a voyage round the world she will only draw at the most 22 feet of water, and—a singular fact indeed—the expenses of the voyage will be only about one-fifth what it would be in the steamers now afloat. For 13 years M. Rollin Germain has been secretly studying his new system of mechanism and building, and eminent engineers in the United States have assured him that his discovery is destined to make an epoch in the history of steam navigation."

Mr. De St. Croix sends the following reply to "Inquirer":—

GENTLEMEN,—Upon the principle that he who meddles with science is bound to justify his interpretations of it when questioned, permit me to remark in reply to your inquirer wishing to know whether there is not some mistake in my statement of the relative angles of the screw on its axis, that the fair, and I might add just, interpretation of the diagrams contained in my little narrative of the screw's origin, that the fans of it, though at 90° of their axis, would, inversely twisted or feathered as represented, be 45° of each other's centre. If I am in error, and possibly our terms differing may make it appear so, the doubt may be easily disposed of if your inquirer, as a practical man or perhaps an engineer, will kindly take up the subject *pro bono publico* with as good a spirit to the oppressed as that which prompted the former communication of, Gentlemen,

Your obedient servant,

W. DE ST. CROIX.

Grove-end, Highgate, 19th Nov., 1859.

LIST OF NEW BOOKS.

Maury's Physical Geography of the Sea, 5*s.*

Patents for Inventions.

ABRIDGED SPECIFICATIONS OF PATENTS

THE abridged Specifications of Patents given below are classified, according to the subjects to which the respective inventions refer, in the following table. By the system of classification adopted, the numerical and chronological order of the specifications is preserved, and combined with all the advantages of a division into classes. It should be understood that these abridgements are prepared exclusively for this Magazine from official copies supplied by the Government, and are therefore the property of the proprietors of this Magazine. Other papers are hereby warned not to produce them without acknowledgment:—

STEAM ENGINES, &c., 976.
BOILERS AND THEIR FURNACES, &c., 1005.
ROADS AND VEHICLES, including railway plant and carriages, saddlery and harness, &c., 947, 983.
SHIPS AND BOATS, including their fittings, *None*.
CULTIVATION OF THE SOIL, including agricultural and horticultural implements and machines, 971, 972, 977, 980, 1009.
FOOD AND BEVERAGES, including apparatus for preparing food for men and animals, 999, 990.
FIBROUS FIBRES, including machinery for treating fibres, pulp, paper, &c., 950, 960, 961, 981, 985, 991, 996, 998, 1006.
BUILDINGS AND BUILDING MATERIALS, including sewers, drain-pipes, brick and tile machines, &c., *None*.
LIGHTING, HEATING, AND VENTILATING, 968, 989, 992.
FURNITURE AND APPARATUS, including household utensils, time-keepers, jewellery, musical instruments, &c., 944, 945, 952, 953, 974, 979, 990, 1001.
METALS, including apparatus for their manufacture, 948, 956, 959, 962, 992.
CHEMISTRY AND PHOTOGRAPHY, 957.
ELECTRICAL APPARATUS, 942, 951.
WARFARE, 965, 968, 984.
LETTER PRESS PRINTING, &c., *None*.
MISCELLANEOUS, 943, 956, 947, 945, 955, 958, 963, 964, 967, 970, 973, 975, 978, 986, 987, 988, 993, 994, 995, 1000, 1002, 1001.

912. W. SIMONCOCK. "Improvements in submarine and subterranean electric telegraph cables, and in machinery for the manufacture thereof." Dated April 14, 1859.

Here the patentee applies to the conductor one or more spiral or longitudinal layers of fibrous material saturated with a compound of india-rubber, gutta-percha, and bitumen. He next weaves an outer casing of yarns, threads, cords, or lines, of silk, cotton, flax, hemp, previously saturated in the aforesaid compound. *Patent completed.*

913. A. MC DOUGALL. "Improvements in coating metallic surfaces." Dated April 14, 1859.

This consists in coating metallic surfaces with a preparation composed of sulphur, heavy oil of tar, pitch, or asphaltum, and bees'-wax in certain proportions. *Patent completed.*

914. L. J. HIGHAM. "Improvements in billiard tables." Dated April 14, 1859.

This consists, 1. in making the cushion much lower than usual. 2. in making the angles of the cushion at the pockets more acute than heretofore. *Patent abandoned.*

915. S. BARNWELL AND A. ROLLASON. "Improvements in the manufacture of umbrellas, parasols, hats or hat covers, caps, capes, coats, mantles, dresses, gloves, and other similar articles." Dated April 14, 1859.

This consists in covering the above named articles with, or manufacturing them of, a silk, cotton, worsted or other woven fabric that has previously been dressed or coated with a preparation of collodion and oil. We cannot devote space to the details of the process. *Patent completed.*

916. G. ABELLIOU. "An extensible arching plane." Dated April 15, 1859.

This invention is not described apart from the drawings. *Patent completed.*

917. W. A. GILBEE. "Improvements in the construction of buffers for railway and other carriages, also applicable to other purposes where springs are employed." (A communication.) Dated April 15, 1859.

This consists in employing compressed atmospheric air or other fluid enclosed in a lenticular or other formed bag or receptacle, made of india-rubber, &c., such bag being surrounded by a moveable metallic ring or envelope placed within the buffer cylinder, and acted upon by a piston or plunger attached to the buffer head. *Patent abandoned.*

918. J. CHAPMAN. "An improvement or improvements in the manufacture of angle iron." Dated April 15, 1859.

This invention is not described apart from the drawings. *Patent completed.*

919. G. ASHCROFT. "Improvements in working presses and other hydraulic machines." Dated April 15, 1859.

The patentee claims the working of presses and other hydraulic machines by the employment of an accumulator combined with a force pump or force pumps as described. *Patent completed.*

920. H. BOOR. "Improvements in treating sheep or other pelts, so as to give them the appearance of rough calf." Dated April 15, 1859.

After the pelts have been tanned in the usual manner, the inventor puts them in frames and stains them, and while they are cool works them with a knife, and rubs them with pumice stone, and before dry he shaves them. When dry he again rubs them with pumice stone. *Patent abandoned.*

921. H. A. SILVER. "Improvements for insulating wire for electric telegraphs." Dated April 15, 1859.

Here the conducting wires are wound round with strips of india-rubber applied in one or more layers, and then subjected to the action of steam or heated air, by which the edges of the india-rubber become joined or cemented, and a complete coating is obtained to the conducting wires. *Patent completed.*

922. H. BARROW. "A new or improved fastening for fastening trunks, boxes, and articles of dress, and for such other purposes as the same is or may be applicable to." Dated April 16, 1859.

This fastening consists of two parts, one part being a knob, stud, or button, and the other part being an elastic disc or diaphragm having a hole in its middle smaller than the knob, &c., and in which hole the knob, &c., engages. *Patent completed.*

923. T. WHITE. "An improvement or improvements in frames or stands for holding liquor bottles, pickle jars, cruets and custards, and for holding bottles and vessels generally." Dated April 16, 1859.

Here the frames or stands are made in separate pieces which may be joined to a central piece having a handle so as to form a frame or stand of the ordinary kind. *Patent abandoned.*

924. J. GLASGOW AND S. HAND. "An improved variable circular motion, applicable to slotting, shaping, and planing machines, or similar purposes." Dated April 16, 1859.

The patentees give motion to the main shaft of the machine by gearing or otherwise, and place upon one end a boss or plate having fixed to or cast with it a pin forming a crank, which pin works within the steel surfaced sides of another plate or boss fixed upon or cast to another shaft, the centre line of which is placed out of line or centre with the first mentioned shaft, so that it may receive variable motion, which being transmitted to tools of different descriptions enables them to employ a slow and powerful motion during the process of cutting, and give the return stroke with greater velocity. *Patent completed.*

925. L. COLLIER. "An improved feeding apparatus, applicable to grain, loaf-sugar, drugs, or other similar materials." Dated April 16, 1859.

Here the material passes into a hopper and falls at the lower part upon an endless feeding band, the motion of which carries the material out of the hopper in any desired quantity, its adjustment being determined by a sliding door or valve having a regulating screw and nuts. There are other features included. *Patent abandoned.*

926. W. CLARK. "Improvements in apparatus for separating metals from their ores and other matters." (A communication.) Dated April 16, 1859.

This invention is not described apart from the drawings. *Patent completed.*

927. W. E. NEWTON. "Improvements in the manufacture of alumina." (A communication.) Dated April 16, 1859.

This consists in processes to be employed in precipitating alumina either pure or in combination with other substances from its solutions in alkalies in the state of aluminate of soda or potash. The processes adopted by the patentee are described at very great length in his final specification. *Patent completed.*

928. J. HAMILTON. "Improvements in apparatus for regulating prime movers driven by water." Dated April 16, 1859.

Here the supply of water is not interfered with, the governor being arranged to put in action a brake or other retarding appliance which absorbs any surplus power, and thereby prevents such power from increasing the speed of the machinery. *Patent completed.*

929. A. COURAGE. "An improved method of obtaining the metallic particles contained in fumes or vapours from lead and other smelting works." Dated April 16, 1859.

This consists in the introduction of steam into the flue or flues communicating with the various furnaces, which, mixing with the fumes, causes the deposit therefrom of the metallic particles contained therein or therewith. The patentee prefers to use for the generation of the steam boilers or tanks placed in

convenient positions in the flue or flues, and to utilise the waste heat therein to generate the steam; but steam generated in a boiler placed in any other convenient position may be introduced into the flues. *Patent completed.*

930. H. HARRISON. "Certain improvements in looms for weaving." Dated April 16, 1859.

This consists in making the taking-up rollers of sheet metal. The patentee prefers to use a sheet iron shell attached to cast iron discs or ends fixed to a shaft or furnished with trunnions. The shell after being varnished is covered with emery in the usual way. *Patent completed.*

931. J. SIDEBOTTOM. "Improvements in the construction of tubes and partial tubes, and in machinery or apparatus for placing them on the spindles of machines used in spinning, doubling, winding, and warping; also, improvements in machinery for making such tubes and partial tubes." Dated April 16, 1859.

This consists in applying to slit tubes or partial tube projections to facilitate the operation of placing them on to the spindles of machines with which they are used. The object of these tubes is to keep the hole in the cop perfectly open when the cops are removed from the spindles, and until they are placed on the spindles of the shuttles or winding machines, so that the yarn can be wound off without, or nearly without, waste. The patentee also makes tubes of suitable metal or material with a slit made in each of them lengthwise without applying thereto the projections above described. These tubes may be placed upon the spindles in the usual way, and by means of their elasticity will readily adapt themselves to the spindles, though their diameters may be somewhat too small, as occasionally happens. *Patent completed.*

932. H. H. VIVIAN. "Improvements in smelting copper." Dated April 16, 1859.

Here the inventor calcines the ore in the first instance so far that when smelted it will produce with regulus similar to that usually produced after two calcinings and two smeltings, and containing say 70 per cent. of copper, and the slag produced in this smelting process which will be rich in copper he smelts in a blast furnace, by which he obtains from it a further quantity of regulus and a clean and more uniform slag. He employs as fuel in the blast furnace either wholly or in part the coal and cinders which fall through the bars of the calcining and smelting furnaces. He also employs the blast furnace to reduce the red or coppery slags resulting from processes of copper smelting which are subsequent to the production of regulus. *Patent abandoned.*

933. N. KENWARD. "Improvements in machinery for obtaining motive power by fluids." Dated April 16, 1859.

Here two or more cylinders are arranged around a shaft or axis turning in suitable bearings. The shaft or axis passes through the cover or ends of the cylinder at a distance from the centre of each, so that the cylinders are excentric to the shaft or axis. Each of the cylinders is divided longitudinally into two compartments by a partition, piston fixed to the shaft or axis. Water or other fluid is supplied through the shaft or axis into each of the cylinders to one side only of the pistons or partitions therein. As the water or other fluid in the several cylinders is constantly pressing on the larger leverage of the partitions or pistons there is a tendency to cause them with their axis to rotate. *Patent abandoned.*

934. G. B. CORNISH. "Improvements applicable to fog-horns." Dated April 16, 1859.

This consists in applying to fog horns to be used at sea, a pair of hand bellows similar in construction to those now in common use for domestic purposes. *Patent abandoned.*

935. W. WALKER. "Improvements in rocket guns." (A communication.) Dated April 16, 1859.

This consists in constructing rocket-guns with the rear of the breech-end closed, and in allowing the back-fire of the rocket to escape through an opening or openings on the top of the barrel in place of the rear as now practised, and in fitting to the fore end or muzzle of the barrel a jointed curtain or flange of, say, about 14 inches in diameter, which is hinged so as to be let down across the muzzle of the gun during the time of taking aim, but which rises up as the rocket leaves the gun and effectually prevents the back fire of the rocket from acting on the rear of the curtain or flange. *Patent abandoned.*

936. J. MOULE. "A new compound for illuminating purposes." Dated April 16, 1859.

This consists in mixing alcohol with turpentine or other hydrocarbons so as to form a liquid suitable for illuminating purposes. *Patent abandoned.*

937. J. LUIS. "An improved machine for raising water." (A communication.) Dated April 16, 1859.

This invention is not described apart from the drawings. *Patent completed.*

968. R. WAREY. "Improvements in breech-loading ordnance and its projectiles." Dated April 18, 1859.

This consists, 1, in attaching to one end of a hollow cylinder a detachable breech, provided in the inside with a roller or stop, and by turning this roller or stop about a quarter part round, the cartridge is cut, the breech hole is closed, the nipple is primed, and the piece of ordnance is fired. 2. In applying to the outside part of any projectile a thread or screw which can be either cast in the making of such projectile, or can be turned on after the projectile is made. By this method the outside screwed face or projectile can be easily coated with any soft metal for firing from rifled or other cannon. *Patent abandoned.*

969. W. PROSSER. "Improvements in apparatus employed in the production of light." Dated April 18, 1859.

This refers to apparatus used in the production of light by the combustion of oxygen and hydrogen gases on lime, &c., and consists in arranging and securing the lime, &c., in a suitable case, parts of which are cut away to expose the lime, &c., to the action of the jet or jets of flame by which the lime, &c., is held together and moved as one piece. *Patent abandoned.*

970. G. PORTER. "Improvements in valves or cocks." Dated April 18, 1859.

This cock is formed in two halves—the inlet end and outlet—which are bolted or screwed together with an interposed plate in which there is an opening corresponding to the water-way through the cock; at the back of this interposed plate there is a sliding valve, which being moved up or down opens or closes the water passage. A pin affixed to the sliding valve takes into a vertical slide-rod, to which motion may be given by a lever screw or otherwise. The pressure of the fluid behind the slide-valve keeps it in close contact with the face plates, while a very small amount of force moves and opens or closes the passage. *Patent abandoned.*

971. J. WHITAKER. "Improvements in mowing machines." Dated April 18, 1859.

The patentee causes the bearings or castors of the guide wheels to be moveable so that they may be widened or contracted as desired. The said bearings or castors are placed upon the front rail of the machine, and held fast by set screws, nuts, or wedges. *Patent completed.*

972. J. SHAMAN. "Improvements in agricultural implements for working or cultivating the soil." Dated April 18, 1859.

The patentee constructs the beam of his improved plough of two flat bars put together with spreaders or struts, one of such struts being passed through the front part of the plough frame, and the bars left wide enough apart to admit of the point of the frame being adjusted to the right or to the left in order to set the head of the plough more or less to land as required. To facilitate this lateral adjustment the hind part of the frame is furnished with an upright pivot or bolt, and the tail of the beam has a vertical slotted or split mortice made therein, corresponding with the upright pivot on the hind part of the frame, and through which the pivot passes. This arrangement also admits of the head of the plough being set to any required height. The invention further relates to harrows, and consists in fitting the teeth on to the sides of the beams, and in securing them by bolts extending completely across the harrow, and passing through the heads of the teeth, and through the several beams horizontally. Tubular stretchers are placed on the bolts between the beams for forming the proper width of the harrow, and for enabling the whole to be screwed up firmly together by nuts at the outer ends of the bolts. The invention comprises other features which we cannot allude to in detail. *Patent completed.*

973. M. A. F. MENKENS. "An improved disinfecting compound." (A communication.) Dated April 18, 1859.

This compound is composed by adding 20lbs. of nitric acid to 1 cwt. of sawdust obtained from some light resinous wood, which after being well stirred has 5 oz. of essence of lavender, 5 oz. of essence of rosemary, 5 oz. of essence of spikenard added to it. A quantity of extract produced by the maceration and pressure of about 1 lb. each of orange and lemon peel, is then added with about 25lbs. weight of fine dried sand, and the whole is thoroughly incorporated. *Patent abandoned.*

974. J. C. WILSON. "A reversible shawl cloak." Dated April 18, 1859.

This garment exhibits the appearance of a shawl on one side and a cloak on the other side. *Patent abandoned.*

975. J. LUD. "A safety cigar, vesuvian, or fusco box or case." Dated April 18, 1859.

This consists in the introduction of a spring made of india-rubber to cause the closing of the box or case after it has been opened or used. *Patent abandoned.*

976. W. E. GEDER. "An improved safety apparatus for clearing off condensed steam from steam-engines." Dated April 18, 1859.

The inventor places his apparatus beneath the cylinders of steam-engines, and adapts it wherever steam is susceptible of condensation. He leads the water produced by the condensation of the steam in the cylinder or elsewhere through a tube to the centre of a tap, and from thence through another tube to a reservoir; this reservoir is connected by a double lever to a balance weight, and where the water from the condensed steam shall more than one third fill the reservoir, the balance weight lifts and brings a tube leading from the bottom of the reservoir into connection with the centre of the tap, at the same time cutting off the connection of the centre of the tap with the first-mentioned tube, and from thence the water runs off through an escape pipe. When the reservoir shall thus have been drained to within one-third of its contents, the balance weight falls and restores it to its original position, at the same time bringing the first-mentioned tube again in connection with the centre of the tap, and consequently with the reservoir, and cutting off all communication between the lower tube and the escape pipe. *Patent abandoned.*

977. J. FREER. "Improvements in machines for planting grain and seed, and an improved seed feeder and meter for planting machines." Dated April 18, 1859.

This invention is not described apart from the drawings. *Patent completed.*

978. J. and H. S. MOERTON. "Improvements in hearth-plates or ash-pans." Dated April 18, 1859.

The inventors propose to introduce a peculiar arrangement whereby alternate bars, radiating or parallel, in the upper part or face of the hearth plate or ashpan may be opened or closed at pleasure to admit of the ashes falling between them. *Patent abandoned.*

979. A. DALRYMPLE. "Improvements in the mode of covering crinoline, and in machines used in connection therewith." Dated April 18, 1859.

The inventor weaves the covering material first, and applies it to the crinoline by means of a machine consisting of a drum or reel, a pair of rolls, an overlapping guide or feeder, and boxes for containing the covering material, and an adhesive composition through which the crinoline passes. *Patent abandoned.*

980. G. COLLIER. "An improved mowing machine." Dated April 18, 1859.

The inventor employs a framing mounted on wheels, the front wheel of which is connected to a large toothed wheel which communicates with other multiplying wheels, the last of which communicates with a cross shaft having a universal joint in its centre; the other end of the shaft is fitted with two grooved eccentrics, over which bands are passed connected to a chain moving round a vertical roller. A scythe is affixed to the bottom of the rollers; consequently as the machine moves forward motion is communicated from the driving wheel in front to the scythe roller behind, the scythe moving precisely the same as if in the hands of a mower. *Patent abandoned.*

981. F. and W. EDWARDS. "Improvements in looms for weaving ribbons and other like goods." Dated April 18, 1859.

This relates to the working of shuttles in ordinary narrow fabric looms where two or more sets of shuttles are used, and consists in the use of treddles so constructed that they can be brought in contact with levers communicating motion to the shuttles, the treddles being worked by two tappets on the tappet shaft. These treddles are connected with a lever that is worked by a cam on the tappet shaft which gives an oscillating motion to the treddles, which motion connects and disconnects them with the levers connected with the shuttles. The shuttle levers are worked in joints, and are brought in contact with the treddles by taper slide propellers, which are connected with the jacquard machine. As the machine rises, so the action is communicated to the propellers; the cards of the machine cause the propellers to rise, and by doing so bring the shuttle lever in contact with the treddles, and the lever is borne down by the treddles, thus taking the shuttles connected with that lever, through the warps. By the sliding of the propellers motion is given to any set of shuttles. *Patent completed.*

982. W. PARSONS. "Improvements in preparing sheet iron, and other metal sheets, for japanners and other uses." Dated April 18, 1859.

This consists in tinning each of the edges of a plate or sheet, and then varnishing or coating the actual portion of each sheet or plate with a suitable varnish to prevent oxidation, by which on the one hand the sheets or plates readily admit of being soldered at the edges, and at the same time much tin will be saved. *Patent completed.*

983. J. BODELL. "Improvements in the apparatus applied to the wheels of locomotive, traction, and other carriages, to facilitate the draught." Dated April 18, 1859.

This has reference to two previous patents of the patentee, dated respectively 29th August, 1846, and 22nd February, 1854, and consists in making each bearing plate or surface with a portion of a rail thereon, one end of such rail projecting beyond the central portion of the bearing plate, but the sides of the same end of the bearing plate or surface project as far as or further than the end of the rail, so as to receive the opposite or back end of the next bearing plate or surface between the two front projecting portions of the sides of the bearing plate, which for the time is under the wheel; such hinder end of the next bearing plate or surface is formed with two projections, which, on taking the ground, come on either side of the portion of rail which projects beyond the central portion of the previous bearing plate. The portion of rail which is fixed on each bearing plate or surface only comes to the point at the back end of the bearing plate or surface where the portions which project commence or extend beyond the main surface of the bearing plate. There are in this arrangement two sets of guide plates, one set on each side of a wheel, and there are also two sets of what are called triangular bars, which work through the guide plates; two sides of each of these triangles are formed with curved or cycloidal bars, such as now applied to the inventor's traction engines, and they are attached to their bearing plates or surfaces so as to be capable of moving somewhat to and fro, and in the present arrangement these bars are used, and connected together in pairs at their upper ends, so that in rocking to and fro both go together. *Patent abandoned.*

984. W. GOSLING. "Improved rifle cannon and projectiles." Dated April 19, 1859.

This invention was described and illustrated at page 316, No. 20, Vol. 1 of the *MECHANICS' MAGAZINE*, (New Series). *Patent abandoned.*

985. P. and J. REYNOLDS. "Improvements in machinery or apparatus for hackling flax and other fibrous materials." Dated April 19, 1859.

This relates, 1, to mechanism for splitting, dividing, or cutting longitudinally the fibres of flax, hemp, &c., by means of hackles secured to moveable detached sliding bars projected by springs, buffers, cams, tappets, or levers, into the fibrous substances, causing the hackle pins to penetrate the fibres instantaneously, and close below the holders. It relates, 2, to all hackling machines in which the stick holders are made to descend and ascend, and it consists in the application of clips, buffers, or rollers for holding the ends of the sticks of fibrous material steady when being operated upon by the hackles. It further relates to all hackling machines in which the stick holders are raised up and down, and traversed from one end of the machine to the other, and it comprises an improved combination of wheels and levers to produce the desired motion. *Patent completed.*

986. C. BARRY. "An improved means or apparatus for effecting instantaneous communication on railways between passengers and officials." Dated April 19, 1859.

This consists in the use of any description of polished reflector fixed at each side of the engine, or other part of the train, and so placed that the engine-driver or guard may detect any irregularity or accident, or passengers' signals occurring in any part of the train, by the reflection in the said mirrors. *Patent completed.*

987. I. DUTTON, R. MARTIN, and T. PHILLIPS. "New or improved machinery for preventing accidents in coal or other mines, by the drawing of skips or cages over their pulleys." Dated April 19, 1859.

The object of this invention is accomplished by means of machinery, consisting essentially of a screw on which a wheel is made to advance by the rotation of the drum shaft of the mine engine, which said wheel having advanced to a certain distance in either direction upon the said screw, engages with a clutch, whereby an ordinary break attached to the engine is brought into operation, and the engine stopped. *Patent completed.*

988. A. W. WILLIAMSON. "Improvements in making extracts from liquorice root." Dated April 19, 1859.

Here the inventor boils the spent roots (i. e. the roots extracted by water) with a dilute solution of

caustic alkali for two or three hours, and evaporates the solution thus obtained, together with the one previously prepared by the use of water alone. *Patent completed.*

989. O. MAGGS. "Improvements in cheese-presses." Dated April 19, 1859.

Here a press is made with a bed plate (on which the cheese is pressed), and it has two or more uprights which serve to guide the platten as it is raised or lowered by a screw. The two uprights are connected together by a cross-head, in the centre of which is a hollow socket for the reception of rings of vulcanized india-rubber. The nut in which the screw works is formed with a projecting flange at its lower end, on which are two descending guide-pins which pass through two holes in the lower part or plate of the hollow socket formed in the cross-head. On the flange around the nut one or more rings of vulcanized india-rubber is or are placed; and there is a shoulder within the hollow socket in the head of the press against which the upper ring of india-rubber presses. *Patent abandoned.*

990. J. W. MATTHEWS. "An improvement in the manufacture of hats and other coverings for the head." Dated April 19, 1859.

The inventor forms a felt body, and covers the same with the ordinary silk tissue. These substances he attaches together by suitable varnish or liquid cement. The hat is thus produced having the appearance and advantages of a beaver hat. *Patent abandoned.*

991. A. V. NEWTON. "Improved machinery for weaving seamless bags or other articles with hemispherical, or regular or irregular ends or forms." (A communication.) Dated April 19, 1859.

This consists of a combination of an ordinary jacquard harness and a tapering reed, which narrows from top to bottom, and between the wires of which the threads or yarns of the warp pass. *Patent completed.*

992. Q. BECK. "Improvements in stoves." (A communication.) Dated April 20, 1859.

The patentee claims, 1. Constructing stoves with tops or covers capable of being revolved in order to expose pots, pans, and other vessels placed in apertures therein immediately over the fire, or to remove them to a part of the stove where they will be exposed to less heat. 2. Constructing the tops or covers of stoves of two thicknesses of metal, with space between the thicknesses. 3. The use of a rack and pinion fitted with a crank handle for communicating rotary motion to the cover. *Patent completed.*

993. J. WOTTON. "An improvement or improvements in raising or shaping metals." Dated April 20, 1859.

This consists in raising or shaping sheet metal into globular shaped vessels, by bending the sheet metal into a cylindrical or conical tube, and casting or inserting in the tube a support or lining of tin and lead, the tube being raised into a globular, or nearly globular, vessel by raising dies, the lining or support in the interior of the tube preventing the puckering of the edges of the metal during the raising process. *Patent completed.*

994. J. M. and E. JOHNSON. "Improvements in the production of ornamental surfaces suitable for advertisement tablets, plates for shop-fronts, and for other uses." Dated April 20, 1859.

The patentees claim the combining of a sheet of gelatine having a design produced on it in opaque colour or material with strips of coloured gelatine, and also with metal foil or paper as described. Also the mounting a sheet of gelatine having a design produced on it in combination with opaque strips of two or more colours as described. Also the substitution of sheets or strips of glass for sheets or strips of gelatine as described. *Patent completed.*

995. A. W. WILLIAMSON. "Improvements in obtaining extracts from the liquorice root." Dated April 20, 1859.

This consists in removing and excluding atmospheric air from the vessels in which the roots are boiled with water, and performing the subsequent evaporation of the extract in a vessel from which atmospheric air is similarly removed and excluded. *Patent completed.*

996. H. RAWSON. "Improvements in machinery for combing wool and other fibres." Dated April 20, 1859.

Here the wool, &c., to be combed is fed into the machine between feed rollers, and in front of the feeding head there are two combs; that nearest to the feeding head is a comb about equal in length to the width of the feeding head, and the other is a circular or endless comb. The first comb has a motion communicated to it to and from the circular or endless comb. When the two combs are in contact, the wool, &c., is laid on to them and pressed into their teeth

by brushes. The first comb then moves away from the circular or endless comb, and the slivers are broken; cleaned fringes of fibre then project from both combs. The slivers are next lifted out of the first comb, which then again comes up to the circular or endless comb, and the slivers are again laid on the combs and pressed down, the cleaned ends of the fibres which before projected from the first comb being placed beyond the teeth of the circular or endless comb. These motions are constantly continued, and the circular or endless comb moves on to carry the fibre in its teeth to drawing rollers to be drawn off.

A pair of drawing rollers first draws a sliver from the exterior of the circular or endless comb, and then another pair of drawing rollers draws a sliver from the interior thereof. A third pair of drawing rollers removes the wool from the circular or endless comb. *Patent completed.*

997. L. J. PORTER. "Improvements in knitting machinery." (A communication.) Dated April 20, 1859.

The object here is mainly to produce knitted fabrics of varying width, such, for example, as the sheets of fabric used to form the legs of knit drawers and the sleeves of knit shirts. The invention is applicable, however, to other knit fabrics, as, for example, those in which ornamental patterns are produced by the transference of stitches. The invention is divided into several parts, which we cannot allude to in detail. *Patent completed.*

998. J. APPERLY and W. CLISSOLD. "Improved apparatus for oiling wool." Dated April 20, 1859.

Here the inventors mount, immediately over the upper feed roll, an iron roller in which are sunk lines of shallow holes which form cups for receiving the oil. Above this roller they mount a series of short oil troughs, the bottoms of which are concave to fit the roller upon which they bear, being supported in position by a suitable frame attached to the framing of the carding engine. The concave bottoms of the trough are pierced with holes to permit of the oil issuing out and filling the rows of cups as they are severally brought under these holes by the continued rotation of the iron roller. The close fit of the troughs in the roller will effectually prevent the running of the oil, &c., when the engine is not at work, and limit the supply to the capacity of the cups. As, therefore, the iron roller revolves, it will discharge the oil from the cups on to the upper feed roller, which will deliver it in a thin film on to the surface of the wool as it passes into the carding engine. *Patent abandoned.*

999. A. F. VANHULST. "An improved kiln for drying malt." Dated April 21, 1859.

This consists of a hollow drying drum having its external surface made of metallic gauze or perforated sheet iron, the interior of such drum being divided into six or more perforated compartments each having one or more doors or openings therein. The drum is constructed upon two fly wheels, one being provided with a rack by which motion may be communicated thereto. The fly wheels are mounted upon an iron shaft and are connected together at their extremities by a suitable number of cross bars or tie rods. Upon the drum and fly wheel shaft are fixed two iron rings at a distance of about from one third to two thirds of its length (included between the fly wheels); into these iron rings are screwed a suitable number of radial arms or stays, which extend to, and are connected with, the cross bars which unite the fly wheels together. The drum thus arranged is mounted horizontally, and is put in motion by an endless screw or worm working in connection with the rack over a coke fire fitted at top with an iron framing covered with glazed tiles for receiving the malt which falls from the revolving drum, and for preventing an infectious smell to the beer. *Patent abandoned.*

1000. E. COTTAM. "Improvements in apparatus employed for cutting or sawing metals and other substances." Dated April 21, 1859.

This consists in attaching to the two ends of a saw or knife suitable guides, and connecting them by a band or rope of metal, so as with the said saw or knife to form one continued band; having due adjustment in some part of its length for giving to it any required degree of tension, and from which hand the saw or knife receives a reciprocating movement. The band of metal may be caused either to pass over pulleys or segmental portions of pulleys, or may be formed of suitable lengths, and connected by levers or bell cranks mounted on a suitable frame, and may be actuated by a foot treadle, hand fly wheel, or otherwise. The lightness of the moveable parts of the apparatus admit of a rapid motion. *Patent abandoned.*

1001. T. DAWSON and J. AVERY. "Improvements

in pencil-cases, watch seals and keys, toothpicks, and other like articles of jewellery, lockets, penknife handles, porte-monnaies, and other like articles." Dated April 21, 1859.

This consists in so constructing such articles, so as to allow space for a number of postage or receipt stamps, &c., to be wound in and out by a mechanical contrivance that shall have a propelling power regulated by the number of stamps to be wound in and out. *Patent abandoned.*

1002. J. NAPIER. "Improvements in producing figures or representations upon glass." Dated April 21, 1859.

This consists in using any ordinary print, lithograph, or engraving, or design drawn by hand with printer's ink, and producing a like figure, &c., on glass, by pasting the same on the glass and acting upon this with hydrofluoric acid. *Patent completed.*

1003. J. ALISON. "An improved instrument for extirpating thistles, docks, and other deep-rooted weeds." Dated April 21, 1859.

This consists of an upright stem, furnished at its upper end with a cross handle. At a short distance from its lower end, which is pointed, a steel cutter is inserted at right angles to the stem of the instrument. The edges of this cutter are twisted to an angle of about 37°. On pushing the point of the instrument into the ground, where a thistle or weed is growing, and turning it round by the handle, the cutter penetrates the ground in a spiral direction, cutting the roots of the weed at each revolution, by which means it is effectually destroyed. *Patent completed.*

1004. J. DAVIES. "A new or improved apparatus for ringing door-bells, and a bolt to be used with the said apparatus, and for other purposes to which the said bolt is or may be applicable." Dated April 21, 1859.

This consists of two levers, between the lower ends of which the top of the closed door, or a bolt on the top of the door, is situated, the levers being so connected with the hammer of a bell that the hammer is made to strike the bell as the door opening in either direction escapes from the end of the one or other of the levers. A bolt in which the handle or stem, whereby the bolt is worked, is so connected with the bolt by a spring, that the end of the handle or stem is made to enter holes in the bolt case when the bolt is either shot or withdrawn, and thereby fix the bolt, the liberation of the bolt being effected by putting forward the handle or stem of the bolt. *Patent completed.*

1005. D. AULD. "Improvements in machinery or apparatus for supplying steam-boilers with water." Dated April 21, 1859.

This relates to a previous patent dated 29th April, 1858. On the top of the boiler there is fitted up a vertical pillar standard, carrying at its upper end a horizontal stud for a vertically disposed chain pulley or wheel. Over the pulley is passed a short chain connected at one end to a hollow copper sphere, ball, or rising and falling chamber, and at the other end to a counterpoise weight, such weight being heavy enough to retain the hollow ball at the top of its rise when the latter is empty, but not sufficiently heavy to retain it up when full or nearly full of water. The ball is attached to the free ends of two parallel pipes, the other ends of which are connected to a cylindrical valve, chamber, or cock set off the top of the boiler, and having two pipes passing from it into the boiler, one terminating at or above, and the other below the working water level. The chain pulley has on one side of it a small pulley or cam-piece with one or more notches, inclines, or recesses in its periphery. Immediately below the centre-stud of the pulley there is a second horizontal stud in the pillar, to carry two horizontal reversed weighted levers having adjustable weights on their free ends, which are straight. The opposite or inner ends of these levers are considerably curved, and formed with terminal hooks or catches, being so set that their curved portions embrace a large portion of the notched pulley's diameter. *Patent completed.*

1006. R. A. BROOMAN. "Improvements in knitting frames." (A communication.) Dated April 21, 1859.

Here all the parts now forming knitting frames remain, but the motions thereof are produced mechanically, so as to make them self-acting. By a repetition of parts along a frame a great number of similar fabrics may be produced at one and the same time. The driving shaft runs along the front of the frame, and through bevil gearing, and an inclined connecting shaft motion is communicated to another shaft with excentrics, which are arranged upon it so as, upon the revolution of the shaft, to set in motion levers and cams, which in turn produce all the movements now effected by hand. *Patent abandoned.*

PROVISIONAL PROTECTIONS.

Dated Sept. 13, 1859.

2132. H. J. Warlomont. Improvements in apparatus to be employed in the manufacture of zinc.

Dated Oct. 19, 1859.

2498. G. Gregg. An improved method of dyeing leather black.

Dated Oct. 27, 1859.

2458. P. R. Hodge. Improvements in the process of brewing fermented liquors, and in apparatus connected therewith, and in preparing and separating the materials, and the manner of using them in producing fermented liquors.

Dated Oct. 20, 1859.

2472. J. Mascord, J. Bonnor, and F. Viner. Improved machinery or apparatus for cutting up and pulping or reducing vegetable and animal substances.

Dated Nov. 2, 1859.

2405. J. L. Budden. Improvements in forming and driving piles for the construction of piers, jetties, viaducts, bridges, or other works where piles are usually employed. (A communication.)

Dated Nov. 3, 1859.

2497. J. A. Turner. Improvements in rendering paper waterproof.

2499. I. F. Delavay. Improvements in coffee pots, tea pots, and other culinary or pharmaceutical vessels of the same nature.

2501. C. Bacon. Improvements in globes and shades for gas-lights, and oil or other lamps.

2503. C. W. Siemens. Improvements in insulating electric telegraphic conductors and in battery arrangements connected therewith. (Partly a communication.)

2505. G. Wemyss. Improvements in ventilators.

Dated Nov. 4, 1859.

2507. E. Jazet. Improvements in lubricating apparatus.

2509. A. P. Boothby. Improvements in travelling and such like bags.

2511. L. Koch. A moving tread power.

2513. C. Brook, jun. Improved arrangements and apparatus for flogging, tying, and labelling hanks of yarn or thread.

2515. W. Clarke and J. Gee. Improvements in the manufacture of looped fabrics.

2517. R. A. Brooman. Improvements in breech-loading ordnance and other fire-arms, and in projectiles to be used therewith. (A communication.)

Dated Nov. 5, 1859.

2521. D. Joy. Improvements in machinery for the manufacture of telegraphic cables. (A communication.)

2523. K. A. Cuche. Improvements in galvanizing metallic wires.

2525. T. W. McCallum and L. Woodward. Improvements in frame work knitting machinery.

Dated Nov. 7, 1859.

2527. P. Dictens. A system of letter-paper, letter-invoices, letter-circulars, prices-currents, memorandums, and other missives.

2529. J. A. Clarke. Improvements in extracting seeds or stones from fruit.

2531. H. Charlton. Certain improvements in the method of navigating steam ships or vessels, and in the apparatus connected therewith.

2533. G. Meline. Improvements in mills of whatever kind.

2535. W. E. Newton. Improvements in promoting or accelerating combustion in furnaces or fire-places. (A communication.)

Dated Nov. 8, 1859.

2537. H. B. Powell. The protection and prevention of fouling or injuring by foreign matters the screws, paddles, rudders, and stern posts of steam ships or other vessels.

2539. C. Green. Improvements in the manufacture of tubes suitable for locomotive and other steam-boilers.

2541. J. H. Johnson. Improvements in "passport-outs," or mounts for pictures. (A communication.)

2543. G. Hadfield. Improved machinery for cutting staves for casks and barrels.

2545. W. Clark. A compound applicable for the manufacture of manure, the preservation and disinfection of organic matters, and for other purposes. (A communication.)

Dated Nov. 9, 1859.

2547. G. White. Improvements in the manufacture of endless leather bands, straps, or belts for driving machinery, and in apparatus for effecting the same. (A communication.)

2549. M. A. F. Mennons. An improved means of destroying insects in grain and other organic matters. (A communication.)

2551. J. Dales. Improvements in applying deodorizing fluids to sewers and other receptacles of sewage.

Dated Nov. 10, 1859.

2552. F. T. Hughes. Improvements in railway breaks, also applicable for arresting the rotary motion of wheels and cylindrical bodies in general. (A communication.)

2553. R. A. Brooman. Improvements in mills or apparatus for extracting oil from seeds, and for other purposes. (A communication.)

2557. A. J. Melhuish. Improvements in the construction of cameras for obtaining photographic pictures.

2559. G. Seymour. Improvements in insulating and protecting electric telegraph conductors.

2561. W. Day. Certain improvements in propelling vessels, which said invention is also applicable for converting the force of the wind into a motive power to be used in any convenient way either for stationary or moveable purposes.

PATENT APPLIED FOR WITH COMPLETE SPECIFICATION.

2574. M. A. F. Mennons. Improved apparatuses for the concentration, distribution, and application of the heat evolved by gas, oil, and other lamps. (A communication.) Dated Nov. 14, 1859.

NOTICES OF INTENTION TO PROCEED WITH PATENTS.

(From the London Gazette, Nov. 22, 1859.)

1657. C. S. Walker and R. Hoyle. Furnaces and boilers.

2574. M. A. F. Mennons. Heating. (A communication.)

The full titles of the patents in the above list can be ascertained by referring back to their numbers in the list of provisional protections previously published.

Opposition can be entered to the granting of a patent to any of the parties in the above list who have given notice of

their intention to proceed, within twenty-one days from the date of the Gazette in which the notice appears, by leaving at the Commissioners' office, particulars in writing of the objection to the application.

LIST OF SEALED PATENTS.

Sealed Nov. 13, 1859.

1243. H. Newman.	1846. J. F. Miquel.
1250. J. P. Badd.	1402. W. Burdett.
1253. J. R. Scarthill.	1511. E. T. Hughes.

Sealed Nov. 22, 1859.

1261. J. Knowles.	1388. J. Bruce.
1262. R. V. Leach and T. W. Willett.	1389. W. Green.
1264. G. Burnell.	1344. G. H. Smith.
1263. C. P. Moody.	1346. J. J. Lundy.
1269. R. A. Brooman.	1368. J. H. Johnson.
1277. G. Davies.	1408. T. Greenhalgh.
1270. G. D. Jones.	1450. T. W. Jones.
1290. J. Gibbs.	1763. P. Robertson.

THE
MECHANICS' MAGAZINE.

LONDON, FRIDAY, DECEMBER 2, 1859.

THE TRAINING OF SHIPWRIGHT
OFFICERS.

THE Admiralty have at various times attempted to train superior shipwright officers for the Royal dockyards. The School of Naval Architecture, in which the present assistants to the Surveyor of the Navy and most of the present master shipwrights were trained, was their great effort. Nor, notwithstanding Sir James Graham's animus against it, was it by any means an unsuccessful one. The School of Naval Architecture for the first time taught the Government—and many others beside the Government—that it was possible for efficient shipwright officers to be gentlemen. It did not, of course, make every man who passed through it a genius, or even a clever mechanic; no system of education will ever do that. But it produced several men of eminent ability in their profession, and it made most of those who were trained in it men of taste and culture. It was to one of its members, Mr. Abethell, that Her Majesty, at the launch of the Victoria a few days since, showed marked consideration by repeated acts of grace and favour. All who studied in this school had to encounter opposition and to sustain neglect; but they, for the most part, met the first with firmness, and bore the latter with dignity. If we contrast the present race of master shipwrights with master shipwrights of what was called the "old school"—good "practical" men—we have indeed reason to be thankful for the School of Naval Architecture! The writings of Mr. Abethell, Mr. Chatfield, Mr. Read, Mr. Creuze, and other members of the school, in the "Papers on Naval Architecture" and elsewhere, sufficiently attest the fact that with the qualities of gentlemen they combined an amount of professional ability never before attained by any class of shipbuilders in this, or indeed in any, country.

After the School of Naval Architecture had been abolished some years, a new school having similar objects placed before it was established—about 1848. It was at first intended that this should be named the "Central Mathematical School," but the more fitting designation of "School of Mathematics and Naval Construction" was given it on its establishment. The latter name is that by which it is officially known, although the Committee on Dockyard Economy, for a reason which may easily be conceived, used the former throughout their inquiries. The pupils for this school were selected by competitive examination from among the most promising apprentices of Her Majesty's dockyards, and the Admiralty were so fortunate as to secure as a Principal for it the Rev. Joseph Woolley, LL.D., F.R.A.S., formerly Fellow of St. John's College, Cambridge, now one of Her Majesty's Inspectors of Schools. The improvements which this gentleman has introduced into the modes of calculation adopted by naval architects—the writings on naval architecture which have proceeded from his pen—the high professional attainments with which several of his pupils came forth from the school—all these prove that the Rev. Dr. Woolley brought to his office precisely that combination of ability, energy, and teaching-power (if we may so speak) which was so necessary in an institution of this kind. The pupils entered the school with a knowledge of Euclid, Algebra, and some other subjects ranging with these in scientific studies; and while there,

steadily went through Plane and Spherical Trigonometry, Hydrostatics and Hydrodynamics, Theory of Equations, Co-ordinate and Descriptive Geometry (the latter being a most valuable subject of study, which Dr. Woolley may be said to have almost introduced into English science), the Differential and Integral Calculus, Differential Equations, Snowball's and other works on Mechanics, Moseley's "Engineering and Architecture," all that is known (both published and in manuscript) of the Theory of Naval Architecture, Theory of the Steam Engine, Chemistry, and some other subjects; and the course of study was so conducted by the Principal that, as the students advanced, the light of each new subject was thrown, wherever practicable, upon the profession for which they were in training. In order that the general education of the young men might not be neglected, the Rev. Dr. Woolley taught all of them at least one foreign language, and some of them as many as three such languages; and likewise caused the whole of them to study, and pass examinations in, Jewish History, Logic, Mental Philosophy, Paley's "Evidences of Christianity," Butler's "Analogy," and Pearson on the Creed. One-half of their day time was also bestowed upon actual shipbuilding and laying-off. Such were the studies pursued by the members of the School of Mathematics and Naval Construction, which school, like the former, perished at the hands of Sir James Graham.

Now, one part of the business—a voluntary part, it should be observed—of the recent Committee on Dockyard Economy was to suggest some means of fulfilling the object with which these abolished schools were established, viz., that of providing a class of persons to whom the superior offices of the dockyards might be fitly committed. As a matter of decency, before recommending a scheme of their own, they felt bound to inquire into the nature and effects of the training imparted at the school which was in existence seven years ago. In doing this they subjected but one of the late members of the school to an examination, although there were several others who might readily have enlightened such men as Mr. Bowman, Mr. Murray, and Mr. Laws. Mr. William Owen, an Inspector of Shipwrights in Chatham Dockyard, was the officer selected for interrogation, and, if we are not mistaken, his answers display much better sense than the questions which were put to him. For—will it be believed!—some of these brilliant Committee-men gravely inquired of Mr. Owen who made his bed at Portsmouth? who cleaned his boots? who cooked his dinner? and who carried it to him when it was cooked? Indeed, one of them, after the rest of the Committee had turned from these to weightier matters, actually broke in upon a series of professional inquiries to ask the witness—first, who cleaned the college knives and forks? and, secondly, who did his washing? Will Mr. Murray kindly inform us whether it was or was not Mr. Bowman who put these questions? When the Committee put away childish things, and made sensible inquiries, Mr. Owen acquitted himself in a manner which deserves commendation, and gave a pretty correct account of the studies pursued in the School of Mathematics and Naval Construction.

The opinions which the most enlightened of shipwright officers of the dockyards expressed to the Committee respecting the late school were, it seems to us, even more favourable than could have been anticipated. For it is not an easy thing to estimate the merits of young men impartially, especially when they have undergone a special training. We are apt to

expect too much of them, and to forget what they would have been if left untrained. We are apt, moreover, to exaggerate the defects which we see in them, and to lose sight of the merits which they have no opportunity of displaying. This is particularly true in the case under notice, for up to the present moment not one of the young men trained in the late school has ever yet been examined in the sciences which they spent most of their time upon at Portsmouth. The Surveyor of the Navy has never given them the slightest chance of exhibiting their higher qualifications, but has kept them strictly to competitions in which higher studies have played no part whatever. When we add to these facts the further one, that it is impossible for young men to acquire the higher education of the naval architect without being injured somewhat, for a time, in respect of his practical skill, it would not have been surprising had the dockyard officers generally formed a low estimate of the value of the training which the members of the late school underwent. This very thing happened, as is well known, in reference to the first Portsmouth School—the School of Naval Architecture—and its members endured much undeserved neglect in consequence of it. But we find, as we have intimated, that a favourable view of the members of the late school is entertained by the principal officers of the dockyard. Mr. Abethell, the first Master Shipwright examined by the Committee, states that he thinks the continuance of the late school was desirable in the absence of any other institution for training professional officers. "I think," he says, "its continuance would have held out good promise to the service, as far as a supply of scientifically educated officers is concerned." Mr. Cradock, the first Assistant-Master Shipwright examined by them (now Master Shipwright of Pembroke dockyard), stated that there are young men from the school who have shown that their superior education tends to the advantage of the service; and when asked if he considered there were instances of young men educated at the school whose attainments would qualify them for being raised to the rank of master shipwrights, he answered, "I think that there are, including those who have left the service; and even without them." Even Mr. Moody, who never had the advantage of a special training himself, and who (therefore) prides himself on being an eminently practical officer, goes so far as to say in reference to the members of the late school, "Out of nine whom I know, there are three fully competent to fulfil their duties in their present positions;" and that "there is no doubt of the mathematical attainments" of the pupils generally. The opinions of these three gentlemen may be taken as fair examples of the prevalent views of dockyard officers. We may add to them the fact that three of the members of the school have been employed for several years in the Surveyor of the Navy's department, and that they there perform duties which demand the very highest qualifications of the naval architect.

Despite all adverse influences, therefore, the late School of Mathematics and Naval Construction answered its end satisfactorily, by giving to the service a class of men fit, for the most part, to rise to the superior offices of the dockyards. In the hands of most men it might have proved a failure; and its success was doubtless due to the distinguished ability of Dr. Woolley, its Principal. Had the practical part of the pupils' education been as well attended to by the gentleman who had the responsible charge of it (and who is too old and too afflicted to be mentioned here), there would have been no room left for censure, or even for cavil, of any

kind. The men who passed through it have but to be patient, and they will doubtless rise in time to the highest posts in the service.

In a future article we shall consider the scheme proposed by the Committee of Economy for the training of professional officers.

THE INSTITUTION OF ENGINEERS IN SCOTLAND.

WHEN our eyes light on an admirable youth, full of various faculty and energy, we naturally desire that the best may be made of him—that all his manly attributes may be fully and harmoniously developed. We should grieve to see his reasoning powers over-fostered till he lost all fancy, or his imagination cherished at the expense of his intelligence, or his passions indulged in to the injury of his morals, or his moral nature strained to the detriment of his freedom, or any one part of him duly expanded at the sacrifice of the others. The fact of his existence with a certain set of special capabilities is of itself sufficient to assure us that there is special work, which requires all his endowments, for him to do; and it is this special work which we desire to see him prepare for, and set about. And as with a man, so with an Institution. When we see a Society established with a unique name and novel functions, we can have no pleasure in it unless it performs unique and novel duties, and this with the full force of all its various powers.

We have been led into these reflections by an examination of the second volume of the Transactions of the Institution of Engineers in Scotland. When we hailed the first appearance of this body in 1857, we understood that its objects were in no way inferior to those of similar bodies in England; and these we know are not merely to edify the engineers of a single town, or a few towns only; but first to bring together into a centre, and thence to disperse over the world, professional information which would otherwise be inaccessible to all but a few. The Institution of Civil Engineers and the Institution of Mechanical Engineers most assuredly do this; and we did hope that the Institution of Engineers in Scotland would do the same. The volume before us, however, valuable as it is—for it is valuable—has lowered our expectations of what the latter body is destined to do for us. We begin rather to fear that this youthful Institution, in which we saw so much promise, is getting unduly developed in some of its parts. Its printing and publishing faculty is expanding wonderfully. It has here produced more than 150 pages of matter in beautiful type and on excellent paper, with twelve lithographic plates of considerable beauty, and thirty pages of the most exquisitely printed tables that the eyes of ordinary readers ever perhaps beheld. But, on the other hand, the Society's power of producing valuable professional papers seems to have been unhappily neglected. Scottish engineering seems rather a barren field in this respect. We look in vain into the volume for any considerable display of Scotch engineering works, like that with which the two English Institutions before-mentioned supply us. We have descriptions of Professor Thomson's centrifugal pump, Mr. Bell's ship docks, Mr. Carmichael's steam experiments, a smoke-preventing apparatus or two, Messrs. Napier and Sons' experiments on steel and wrought iron, a note on certain chemical furnaces, and a couple of theoretical papers by Professor Rankine and Mr. Lawrie. This includes, if we mistake not, all the novelties which are the subjects of papers, if we except Mr. Hunt's on Patent Law Reform, which can hardly be deemed an engineering document. We have, it is true, other things described, such

as Mr. Beattie's coal-burning locomotive, the furnaces of Mr. Williams, Mr. Yarrow, Mr. Clark, &c., and other inventions which have been described over and over again in publications; we have also the reports of several more or less desultory discussions in which other improvements are mentioned. But we think it is perfectly fair to say, that the whole second annual session of the Institution produced no more than half-a-dozen good original professional papers from all the engineers of Scotland.

Now, we know something of the difficulties of young societies, and we should be sorry indeed to speak hostilely of the Institution now under consideration. But we must faithfully remind our Scotch friends that they are doing less at present than will speedily be expected of them. The name of their body is dignified, and itself challenges comparisons with other bodies. That which would be accepted, therefore, as ample from a local Institution, will be held meagre coming from them. And it will not do for its managers to forget this. If the volume before us bore the title—"Transactions of the Glasgow Institution of Engineers," it would be deemed a most creditable production. But of the engineers of Scotland more is expected. It is in all friendliness that we tell them so; and we trust their next volume will prove that a word to the Scotch is enough.

THE COMPASSES OF IRON SHIPS.

In pursuing our review of the Liverpool Compass Committee's Report on this subject, we come next to the changeable portions of the ship's magnetism, the *vertical inductive* and the *horizontal inductive*—the latter being now very frequently termed a ship's quadrantal magnetism, from the change in the direction of the deviation due to it in each quadrant of the compass as the ship is swung round. It is not required that a ship should change her geographical position to show the existence of either of these effects of the earth's inductive action, though it is only by such change that the full effect of the former can be properly estimated. By experiments with the vibration needle, a change in the value of the ship's magnetic force will be observed as she is turned with her head in opposite directions. Two values are thus obtained, which give the sum and difference of the ship's permanent magnetism, and that due to induction, the changing vertical, and the changing horizontal, for the place of the experiment. The Astronomer Royal has shown that the chief feature of the ship's vertical induced magnetism, in this hemisphere, is to constantly diminish the earth's directive power on the compass needle. There is reason to believe that it is also, or rather that it gives rise to, a fluctuating quantity which is liable to influence the deviation tables of ships that change their latitude only to a small extent or not at all, by a portion of it being retained for a time. In amount it appears to vary with the position of the ship, the time during which she remains in a given position, and the circumstances to which she may be subjected while maintaining it.

The following facts, with some experiments to be afterwards described, are offered by the Committee in support of this position:—(1.) Deviations observed with the Admiralty compass on board the Royal Charter, after she had been lying for some weeks head to N.N.E., differed by several degrees from those observed after she had been for ten days with her head to W.N.W. (2.) Captain Toker, of the Drogheda paddle-wheel steamer, plying between Liverpool and Ireland, states that he has commanded her for seven years, during which time she has had her compasses adjusted twice or thrice. The compass

adjuster stated on the last occasion, that he had not known any ship which, after the lapse of three years, required so little alteration. The Captain informs the Committee that after each time she has been in the graving dock, head N.N.E., for a few days, to be scraped and painted, he has observed her to deviate considerably to the north of her course, both in going to and returning from Ireland. He could not offer any reason for this. On the first occasion of his noticing it he sailed in company with another steamer; instead of keeping parallel with her, as had been usual, he remarked that her Captain had changed his course; eventually he discovered that it was himself that had done so, though he appeared by compass to be steering as before. After making a few voyages this extra deviation disappeared, and he was able to steer his accustomed courses. These deviations indicate increased attraction aft, and would probably arise from the ship's northerly position when in graving dock. (3.) The captains and overlookers of several steamers trading to the Mediterranean state that while in this sea they make certain courses very correctly; in attempting the same after leaving Cape Finisterre, with ship's head northerly and easterly for two or three days, they get to the north of their course. Thus, in the run from Point Lynas to the N.W. light-ship, or the Bell buoy, course about E.S.E., they sometimes get so much as six, eight, and nine miles to the north. The cause already spoken of appears an adequate one. (4.) Similar experience is reported by the captains of iron steamers on the North American lines. On the homeward voyage, towards Newfoundland, they get to the N. (or the left of their course), after making what is considered to be ample allowance for deviation and the rapid change which occurs here in their variation. (5.) The captain of the *Laconia* steam-ship, trading to the Mediterranean, stated that in two or three successive voyages, in departing from Cape Finisterre for the Irish Channel, he had kept the ship in the same direction throughout by the mast compass, and narrowly watched the steering compass; he had found its deviation gradually increase as he came northwards till, on reaching the Smalls, it amounted to three-quarters of a point. All these cases show a deviation to the north of the usual courses after the ship's head has been northerly for a short time, and they require some explanation of a general and comprehensive kind.

In this place may be introduced some particulars of the Committee's vibration experiments, as bearing especially upon this topic. They show fluctuations both in the amount and direction of a ship's induced magnetism of considerably greater extent than is generally supposed to exist. These fluctuations do not appear, however, to affect *practically* an authoritative statement, which has already been supported by the Committee, and which, as it forms the key to the correction and calculation of compass deviations, cannot be too earnestly repeated—namely, that a ship's magnetism for any given place may be very closely represented by a permanent polar magnetic force in combination with a quadrantal force, or one changing its deviation in each quadrant as a ship is swung round.

In reference to the disturbance of the compass due to horizontal induction or quadrantal deviation, the Committee remark that its peculiar character is too frequently overlooked. This is the more to be regretted as in all the iron merchant ships and steamers which have been examined in Liverpool it forms an important feature. Unless its character be under-

stood and its value estimated, an approximate curve of deviations cannot be projected, from four observations, with any chance of success. Two cases have been named in which it exceeded a point; on board the Royal Charter it amounted to six and seven degrees. In such instances it might give rise to an uncertainty in the deviation of twice this amount.

While the deviations arising from permanent magnetism and vertical induction vary as the sine of the angle of direction of ship's force, at the station of the compass, with the magnetic meridian as indicated by the disturbed needle, the quadrantal deviation has been shown to vary as the sine of twice the azimuth of ship's head by disturbed compass very nearly. In practice these two deviations are combined in every conceivable manner. With the exception of one or two cases of elevated compasses, the whole of the deviation tables which have been obtained in Liverpool by the Committee have exhibited *plus* quadrantal attraction. Perhaps a *minus* deviation of this kind would be found to exist in a compass placed within a skylight, in which the iron deck beams are cut off on each side of it, or in an iron ship with wooden beams.

Following the remarks of the Committee we next come to the following practical topics:—
1. Errors induced by heeling in iron ships. 2. Elevated or mast and standard compasses. 3. Modes of swinging ship. 4. Modes of adjusting compasses. 5. Projection of deviation tables by curves. 6. Miscellaneous operations of the Committee.

The errors arising from the heeling of iron ships are among the most perplexing which demand a captain's attention. As a number of causes may conspire to produce, modify, or cancel their effect, it is not surprising that the evidence before the Committee on this branch of the investigation was not very complete. Among such causes may be named the following:—*a.* The rising or lowering of the attracting mass, causing its magnetism to act with more or less leverage as it approaches to or recedes from the plane of the compass card. *b.* Vertical iron or magnets below and near the compass. *c.* Induced vertical polarity in iron deck beams, increasing as they incline from their usual horizontal position. *d.* Proximity of badly proportioned and badly placed chain-boxes. *e.* Action of horizontal compensating magnets when they are placed below and too near the compass card. The last, though partially corrective of some errors from heeling, in certain positions of the ship, appear to aggravate them in others.

The three first-named causes are described as tending to attract the north end of the needle to the weather side of the ship in north magnetic latitude, and to leeward in the south magnetic hemisphere, and as increasing or decreasing the usual deviations, according to their name and the direction of the ship's head. These three may act in the same direction and in the same ship. It is difficult to estimate their separate effects, but the last is supposed to be most prejudicial. The great expense attendant on heeling and swinging ship in port, and the delay caused by such an experiment where every hour is valuable, have prevented the Committee from directly testing this. Deductions can only be made, therefore, from the evidence afforded by various captains and an inspection of the arrangement of the iron near the compasses of their respective ships. Evidence from a number of captains shows:—
1. That in a large proportion of iron ships the compasses are affected by heeling. 2. That errors from heeling are generally most complained of when ships are on or near four-point

courses. 3. That when iron ships have heeled over for a considerable time upon northerly courses, they have been found to windward of their dead-reckoning. To these may be added, the existence of an impression among compass adjusters and others who have paid attention to the subject (among the latter may be named the managing owner of the Cunard Company, Mr. Charles M'Iver, a gentleman of great experience in iron ships), that iron deck beams are a chief cause of compass disturbances.

The following may also be quoted from a number of other cases:—Captain Bonfellow of the steam-ship *Laconia* states, that the same course which, with an even beam, would make the *Smalls* from the coast of Spain, with wind at N.W., would make the *Tusker* to windward, and on the opposite side of the Irish Channel. The captain of the *Sarah Sands* states, that his compensated steering compass has acted remarkably well, except when his vessel has heeled to some extent. This compass is placed over, and comparatively near, large masses of vertical iron. Captain Leitch, of the *City of Baltimore* steam-ship, has favoured the Committee with observations made during several voyages. In every instance the north end of the needle has been attracted to the high, or weather side of the ship. This is the most extreme case which has been recorded. From slight list to starboard to slight list to port, the standard compass, placed about five feet above the deck-house, has been observed to change eight degrees. The apparent cause is the iron beams of the deck-house. There seems reason to suppose that when the deck beams are divided to make space for a skylight, a position for a compass may be found in which the errors from heeling might naturally compensate each other. The errors from vertical induction of deck beams would certainly vary with change in geographical position, or with the earth's vertical intensity. Thus, in the *City of Baltimore*, Captain Leitch mentions variations in the deviation of three-quarters of a point while his ship was in the Mediterranean; but in the North Atlantic, as he approached America, he has noticed an extreme instance of more than a point and a half. The Committee are anxious to collect all the information possible on this intricate and important section of the compass inquiry, as it is felt how very imperfect must be any deductions which may be made from the evidence which has to this time been placed before them.

Great variety of opinion prevails as to the utility of mast compasses. Though in some ships they have been discontinued after a trial, their use is becoming very general, although they certainly are not always free from a considerable amount of error. In moderate weather and large ships, mast compasses are stated to act well; but in small ships, where the motion is greater, the oscillation prevents their being of service, except in fine weather. In nearly every case they show an attraction to ship's head in north magnetic latitudes (giving east deviation with ship's head east, and west deviation with ship's head west, taking ships to the south of their course), and very little quadrantal deviation. The usual *plus* quadrantal deviation is found to decrease as the compass is carried aloft, and is believed, in some cases, to change to *minus* quadrantal after a certain elevation is attained. The effect of the transverse iron, and iron placed before and aft the compass, appears to be cancelled, and in some cases exceeded, by the action of the ship, as a long bar placed below the compass. The Astronomer Royal has, however, exceedingly little faith in the use of compasses at the mast head. Relying on the result of

Dr. Scoresby's observations in the Royal Charter (which were extensively published soon after his return), he (Professor Airy) recommended to the Admiralty that such a mounting should be tried in the Trident, and in a recent number of the *Athenæum* he communicates the facts of the case. Among the places which are left at liberty by the rigging of the ship, the best (in a magnetic sense) was, he says, selected; and great care was taken to mount the compass in an unexceptionable manner. It was, however, totally useless. Its deviations were so large that it could give little assistance in interpreting the indications of the compass below; and when compared with a corrected compass, and above all with a corrected adjustable compass, it was of no use whatever. The Astronomer Royal further remarks that the deviations of the mast-compass of the Great Eastern are large; that that of the Royal Charter became useless from sluggishness, produced, he conceives, by the injury done to the pivots and bearings by the tremor of the mast; and that he does not think the method will ever be extensively used.

We now come to the question of the best modes of swinging ships. Undoubtedly, the easiest and best mode of ascertaining the deviations of a compass is by reference to the bearings by it of a distant object, whose true magnetic direction is known; but, in a river or a confined dock, such distant object is seldom attainable. Next to this, the Committee approve of the system of fixed magnetic bearings of a conspicuous object, which has been adopted at Liverpool. The principle is the same as that of reciprocal bearings, with the two advantages of freedom from error in the shore compass, and saving the time usually lost in repeating and deciphering the shore signals. There is another mode sometimes adopted in Liverpool and at other places—that of carrying the shore compass round the dock, so as always to be in a line with the ship's masts, and by preconcerted signals checking the ship as she approaches the true points of the compass. This plan does not admit of accuracy, even when pains are taken to insure it. To an adjuster who understands his business it must be tedious, while in the confined situations, in which only it can be employed, the shore compass is liable to varying disturbances, which give rise to most inconsistent tables of deviations. In some cases it has occasioned serious errors.

At this point we must pause for the present.

THE CASE OF HENRY CORT,

AND

HIS INVENTIONS IN THE MANUFACTURE OF BRITISH IRON.

BY

THOMAS WEBSTER, M.A., F.R.S., &c., Barrister-at-Law.

X.

DURING the period embraced in the account of Cort's invention, and its introduction already given, everything had gone on with greater success than had attended any inventor. The merits of the invention were not only placed beyond a question, but the merit of the inventor was universally acknowledged. The mill at Fontley was in full operation, and visited by the large manufacturers anxious to be informed as to the best means of practising the new manufacture. Licences were taken at royalties estimated to yield £250,000 to the owners of the patents.

At this crisis, 1788, Adam Jellicoe, the partner of Cort, committed suicide, under, it would appear, the pressure of dread of exposure of being a defaulter to the amount of £27,500 of public money entrusted to him, and for which

he was responsible, for wages of seamen and officers of the navy.

The following letter, found in the iron chest of Adam Jellicoe by G. Black, an accountant employed by Mr. Trotter, the Paymaster, to schedule Jellicoe's effects preparatory to the extent, in 1789, dated 11th November, 1782, throws some light on the causes of the act:—

"Ever since I have had public money in my hands, it has been a constant rule with me to have the value of it in Navy bills in the iron chest, that in case of my death the balance might be immediately paid in; and I have always had much more than my balance by me, till my engagement about two years ago with Mr. Cort, which by degrees has so reduced me, and employed so much more of my money than I expected, that I have been obliged to turn most of my Navy bills into cash, and, at the same time, to my great concern, am very deficient in my balance. This gives me great uneasiness, nor shall I live or die in peace till the whole is restored.

"But should my death be sudden, and before I can make up the public balance, I hope I shall not be reflected on, as I have always meant honestly and justly; and I must earnestly entreat the Treasurer, Paymaster, or whoever is most concerned, not to be severe in requiring the balance to be immediately restored, lest my character should be traduced, and my son Samuel (who I hope is in a way to make a comfortable provision for his brothers and sisters) and my family be ruined.

"I have considerably more than £20,000 engaged in the business with Mr. Cort and my son, and have paid almost all my engagements and acceptances. I expect the returns in bills for ironmongery wares will now come in very fast; besides which, General Tenyn owes Mr. Cort nearly £3,000, which Mr. Wilkinson, in Abchurch-lane, assures me is as safe as if I had it. Mr. Morgan, the Purser (whose name is in the contract for iron wares), owes Mr. Cort near £3,500. Both these debts are assigned to Messrs. A. and S. Weston, 31 Fenchurch-street, for my use. Messrs. Weston have also in their hands monies received from Captain Wm. Hay and Captain O'Hara, in the Royal Navy, due to Mr. Cort and assigned to me.

"Mr. Sykes' agent, in Crutched Friars, has a Navy bill of mine, value £2,500, with interest due on it, on which I borrowed £2,000 of him. Mr. Weston above-mentioned will, in case of my sudden death, assist in raising money for me, as I doubt not Messrs. Bennett and Care, Fenchurch-street, to save me from any imputation, and my family from being hurt; and they may be sure of being repaid by remittances from Mr. Cort and my son, so that I hope my balance will shortly be made up; and as I have ever meant to deal justly and honestly with the public and every private person, I again entreat that some favour may be shown to the family of one who has served faithfully for above forty years, and that it will not be insisted upon that the balance be immediately paid up. (Signed) "A. JELICOE.

"P.S.—I have also a mortgage of £4,000 on the estate of Mrs. Catherine Dent, and above £800 interest due on it."

The following affidavit in the Exchequer of Mr. Trotter, shows the liability thrown on Cort by the proceedings of his partner:—

"Alexander Trotter, of the Navy Pay Office, Esquire, and Paymaster of His Majesty's Navy, maketh oath and saith, that Henry Cort, of Gosport, in the county of Southampton, iron manufacturer, is justly and truly indebted unto His Majesty in the sum of £27,500 and upwards, for so much of His Majesty's money

paid by the deponent as Paymaster of His Majesty's Navy unto Adam Jellicoe, late of Highbury-place, in the county of Middlesex, Esq., the chief clerk in the pay branch of the office of the Treasurer of His Majesty's Navy, for the purposes of his paying and applying the same in discharge of the wages of the officers and seamen of His Majesty's Navy, but which said sum the said Adam Jellicoe did not pay and apply for the purpose for which this deponent paid him the same, but which said sum he the said Adam Jellicoe at different times lent and advanced unto the said Henry Cort, from whom the same now remains justly due and owing; and this deponent saith he verily believes that the said Henry Cort is much decayed in his credit and in very embarrassed circumstances, and therefore this deponent verily believes that the aforesaid debt so due and owing unto His Majesty is in great danger of being lost if some more speedy means be not taken for the recovery than by the ordinary process of this Court.

(Signed) "ALEX. TROTTER."

The action taken on this affidavit was most remarkable. The then Treasurer (Mr. Dundas) adopted a liability for which he was in no way honourably or otherwise liable, as more than £20,000 of the sworn debt had been abstracted eight years previously, during the trust of Mr. Wellbore Ellis. Between 1781, when Mr. Ellis left office, and 1789, there had been four surrenders of trust in the office of Treasurer; as it was incredible, not to say impossible, that all these four persons could successively have overlooked Jellicoe's current default, so well known in the office, there must have been some strong consideration moving Mr. Dundas and Mr. Trotter to have induced them to incur the risk of perjury in order to assume unnecessarily a debt to the Crown of £27,500 and upwards. In the previous year, 1788, Mr. Dundas had called upon A. Jellicoe to restore his defalcation, and make good his balance, to which intimation Jellicoe replied, July 10th, 1788: "But (in the meantime) in case you should think a security necessary for the responsibility of the situation which I have the honour to hold, I beg leave to offer the enclosed (bonds and assignments of Mr. Cort's patents) amounting to a larger sum than I can at any time hope to have in my hands unemployed.—(Signed) A. Jellicoe." That Mr. Dundas thought very highly of the value of these securities at this time is shown by his memorial to the Treasury, May 1800, in which, referring to Adam Jellicoe's connection with "Mr. Cort, the patentee of an invention for making wrought from unwrought iron," he proceeds: "The sanguine hopes that were entertained of Mr. Cort's inventions becoming productive, and the inefficiency of harsher measures being considered, it was determined Mr. Jellicoe should not be immediately suspended, but that he should be pressed to use every exertion to pay up his balance." He then gives an account, *wholly false*, of the extent subsequently issued, immediately after A. Jellicoe's death, for he states that "all his effects were turned into money and paid in diminution of the debt," whereas it was discovered by the Commissioners of Naval Inquiry that Mr. Cort's freeholds in Hampshire had not been sold, but that Samuel Jellicoe, the son of the defaulter, had been put into possession of them, under the extent, and had continued peaceably to enjoy them without any process of the Crown up to the date of that report in 1803, a period of fourteen years; and the Commissioners likewise ascertained that out of the effects of Adam Jellicoe, scheduled by George Black, under the extent, at £89,657, a sum of

only £13,895 had been placed by Mr. Trotter to the credit of the alleged default. "Everything available having thus been turned into money and paid in diminution of the debt," the mendacious memorial continues: "the patents granted to Mr. Cort were also secured, and for a long time hopes were entertained that Parliament would, by rewarding so beneficial an invention, have provided a further fund for lessening the debt," (i.e. the balance of the £27,500 and upwards sworn to by Mr. Trotter); "but that, notwithstanding the great merit of the invention—and the use of it to the country remains uncontested—no compensation has ever been made." If it be fair to interpret men's words by their actions, there can be little difficulty in reading what was in the minds of Mr. Dundas and Mr. Trotter, when they ruined Mr. Cort. At the date when he was turned out of his own works and other freeholds in Hampshire, and his partner, Jellicoe the younger, snugly installed in them, the Treasurer of the Navy had no greater difficulty before him in the way of obtaining payment either of the sworn debt of £27,500, or of the balance of it, than to carry the contracts "he had secured" to Mr. Richard Crawshaw and others, and demand of them a payment of 10s. per ton of puddled and rolled iron, secured under their hand and seal, to the holders of those contracts. The Treasurer had the legal power to exact dues amounting between 1789 and 1798 to nearly £200,000. What he did receive could not be ascertained from the ashes of burnt documents, and he refused any personal information to the Commissioners in 1803, and to a Committee of the Commons in 1805; but, according to the memorial quoted, he had received nothing, for the balance of A. Jellicoe's default remaining unpaid in May, 1800, is stated in that document to be £24,846, which, subtracted from the sworn debt, leaves £2,654 and upwards as the total realised in eleven years to the public by the illegal seizure of the inventor's effects, and the peculiar surrender to his private partner of the freeholds seized under a Crown writ for the discharge of a public debt. When we consider how very simple was the process of demanding of the contracting iron-masters the patent dues, which for the year 1789, at the date of the extent, amounted to £15,000, £15,000 more in 1790, and £25,000 more in 1791, and which demand might have been enforced by the same legal process used to ruin the inventor, it is not difficult to surmise the motive for abstaining. Mr. Whitbread with great, but surely not undue severity, charged Lord Melville, upon this memorial (the prayer of which was acceded to without examination) with obtaining a receipt or discharge from the Treasury for this £24,846, "under false pretences."

Such is a brief outline of the facts connected with the lamentable suicide of Cort's partner, and the conduct of the authorities, which was made the subject of further investigation in 1805 on the question of the impeachment of Lord Melville.

Her Majesty's ship *Wrangler* returned to Woolwich yesterday from an experimental cruise to try the 40 lb. and 80 lb. Armstrong guns at sea. A most complete course of experiments was carried out under the inspection of Capt. Sir William Wiseman, Vice-President of the Royal Ordnance Select Committee of Woolwich Arsenal, and Lieut. Thomas L. Ward, of the gunnery-ship *Excellent*. Sixty rounds of ammunition with the elongated shot were fired with perfect success, and every equipment pertaining to the gun was pronounced faultless.—*Times* of Saturday last.

Literature.

Ure's Dictionary of Arts, Manufactures, and Mines. New Edition. Edited by H. HUNT, F.R.S., &c. Part II., December, 1859. London: Longman and Co.

WE observe now what we did not notice when the first part of the work was recently before us, viz., that this new edition is to be published in *monthly* parts. In a twelvemonth's time, therefore, the re-issue will be completed. This is a most satisfactory arrangement.

This part shows that the great improvements noticed in the first were not put forward as mere beguilements to purchasers. The labour and expense bestowed upon the new edition are as manifest here as they were in it, the 384th page of the present part carrying us only to the article *Borax*, which appeared on the 231th page of the edition of '53. We have new articles on *Artillery* (9½ pages), the *Atomic Theory* (3 p.), *Borwood* (1 p.), *Bells* (1 p.), *Benzole* (1½ p.), *Boghead coal* (2 p.), the commencement of an elaborate one on *Boring*, and some scores of shorter ones. At the same time many of the old articles are extended—*that on Barley* from 10 lines to 1½ pages, on *Bismuth* from 2 to 8½ pages, on *Bleaching* from 17½ to 33½ pages, on the *Blowpipe* from 6 lines to 3 pages, on *Boracic Acid* from ¼ to 2 pages, on *Borax* from 2 to 3, and so forth. The article on *Bleaching* deserves particular notice, as it contains a large mass of new and valuable matter, and is illustrated by a truly beautiful display of engravings on wood. We recommend readers—all who can afford five shillings a month for the purpose—to put themselves in possession of the parts of this edition of Dr. Ure's unexampled work without delay.

Stories of Inventors and Discoverers in Science and the Useful Arts. A book for Old and Young. By JOHN TIMBS, F.S.A., Author of "Curiosities of London," "Things not Generally Known," &c. With Illustrations. London: Kent and Co. (late Bogue), Fleet-street. 1859.

MR. TIMBS has here contrived to put forward 350 pages on inventors and discoverers without once acknowledging (so far as we can observe) that he is at all indebted to the MECHANICS' MAGAZINE for any of his facts or statements. This will seem a curious circumstance to those who know how prominent a place this Magazine has held for thirty-six years past in connection with inventions and discoveries in "science and the useful arts;" and we may, without vanity, say that he might have avoided some errors had he given greater heed to what has been published here. But having intimated this we hasten to express our sense of the great value of the volume before us. It is, indeed, "a book for old and young," and such a book as no other compiler known to us could be expected to produce. Mr. Timbs does not bestow his labour grudgingly upon these volumes of his which are appearing every few months. They are well thought over, and worked at energetically. This volume is one which no man in England, be he ever so cultivated, need be ashamed to peruse, or could peruse without deriving much instruction from it.

The Gardeners' Year Book, Almanack, and Directory, 1860. By ROBERT HOGG. London: Cottage Gardener Office, 162 Fleet-street, E.C.

MR. HOGG—who is a Vice-President of the British Pomological Society, author of "British Pomology," "The Vegetable Kingdom and its Products," and co-editor of the *Cottage Gardener*—has here started an exceedingly useful and cheap annual. The number for 1860 contains 150 pages of well-selected matter, and is so admirably edited that the success of the author's undertaking will be assured by it.

Cassell's Illustrated Almanack for 1860. London: Cassell, Petter, and Galpin, La Belle Sauvage Yard.

THIS almanack abounds in exceedingly well-selected matter, is lavishly illustrated, and is unexampled for cheapness.

On the Comparative value of Certain Salts for rendering Fabrics Non-inflammable. By FRED. VERMANN, F.C.S., and ALPHONS OPPENHEIM, Ph. D., A.C.S. London: Trübner and Co., 60 Paternoster-row. 1859.

THIS pamphlet forms the substance of a paper read before the British Association at the Aberdeen meeting in September last. An article, which we recently published on unflammable fabrics (which was copied into most English newspapers, and translated into several foreign journals), and a letter from the authors which appeared in our "Weekly Gossip" a week or two since, render further description of the pamphlet unnecessary.

Our Military Engineers; being an Inquiry into the Present State of Efficiency of the Corps of Royal Engineers. London: Judd and Glass, 38A New Bridge-street; and Gray's Inn-road.

THE conclusion at which the author of this anonymous pamphlet arrives, after giving the matter the fullest attention, is that the separation of the Civil and Military duties of the officers of the corps of Royal Engineers is unavoidable, if we wish to preserve the corps. They cannot exist as they are at present. "They may contrive to bungle over their civil duties with the assistance of the civilians attached to the department, but having no one to perform the military duty for them, their utter worthlessness as a professional corps will be fully exposed. How they contrived to hush up their deficiencies in the Crimea cannot be imagined, unless it is attributed to the unity which prevails among them; for there is no body of men who adhere so well to each other in concealing their deficiencies from the authorities and the public as the officers of the corps of Royal Engineers."

Having in view the difficulty which might be supposed to arise in the separation of the civil and military duties of the corps of Royal Engineers, the author believes that all difficulties may be got over by confining the corps to the practice of military duties—which would include the construction of works of fortification, the practice of military bridges, pontooning, siege operations, light infantry manoeuvres, &c., being under the control of the Commander-in-Chief. The exclusively civil duties which they are now supposed to perform, and consisting of the designing, executing, and repairing barrack buildings, storehouses, the management of War Office lands, &c., should be handed over to a civil corps analogous to the Military Store Department, and subject to the Secretary-at-War. This corps would be available in time of war as a substitute for the late Army Works Corps, and could be made to perform the professional duties required in connection with Quarter-Master-General's Department, thereby permitting the employment of the corps of Royal Engineers solely in the military operations of a siege. The Civil Corps is to be composed of men who, previous to their appointment, have received a practical training in architecture, civil engineering, building, &c.

LIST OF NEW BOOKS.

Aberdeen's Principles of Beauty in Grecian Architecture. Donaldson's Architectura Numismatica, illust., 63s. Encyclopedia Britannica, 8th edit., by Traill, vol. 19, 24s. Hogg's Gardener's Year-Book, Almanack, and Directory, 1860, 1s.

Keith's Coming Events cast their Shadows Before, 3 vols., 21s.

Smile's Self-Map, with Illustrations of Character and Conduct, 6s.

Tennant's Ceylon, Physical, Historical, &c., 2nd edit., 2 vols., 50s.

The steel-plated frigate *Gloire* was launched at Toulon at half-past 11 on the morning of the 24th inst., in presence of an immense concourse of spectators. A vast multitude, anxious to see the launch, occupied every point from which the dockyard of the Mourmilion is visible. The harbour presented a most animated appearance. Thousands of boats formed a line to hail the *Gloire* on her passage to the sea, which she accomplished with perfect success.—*Times*.

Proceedings of Societies.

MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY.

Ordinary Meeting, Nov. 15th, 1859. Mr. J. C. Dyer, Vice-President, in the Chair. Mr. John Atkinson made a communication respecting a curiously-shaped fossil, found about a month ago in the Upper New Red Sandstone in a quarry near Runcorn. This fossil had been described in the *Athenaeum* of the 29th of October last by Mr. Henry Wilson, Surgeon, Runcorn, who pointed out its striking resemblance to the mullion and tracery of part of an ancient gothic window, not merely in size and general outline, but in the moulding upon it, as if of tooling by the hand of some primitive mason. On the 5th instant the *Athenaeum* contained two letters on the same subject. Neither of the writers had seen the fossil. Opinions being divided, Mr. Atkinson visited the Runcorn Hill Quarry, examined the fossil itself, and found it to be a mass of fine-grained sandstone veins. These had been deposited in thin horizontal laminae and moulded in a system of cracks formed by desiccation and subsequent modification—probably by the action of water—in the bed of marl (here eight inches thick) so celebrated as being that on which the last of the Labyrinthodon order of animals have left their footprints in such vast abundance at Stourton, Runcorn, Lymm, and various other localities. Professor Roscoe communicated a paper by W. S. Jevons, Esq., late Assayer in the Sydney Branch of the Royal Mint, entitled, "Observations on the Gold Districts of Australia." At the close of the paper the author considers the important question of the probable future yield of gold to be expected from Australia. He believes that no more very large or rich fields of alluvial gold will be discovered in Victoria, but that the present "gold-drift" has by no means been worked out; so that when capital and more complete mechanical appliances are brought to bear upon the ground which the first gold-digger has relinquished as worthless, a constant and remunerative supply of gold can be relied on. It is otherwise, the author believes, with the true gold mines, those in which the auriferous quartz reef is worked. Here the supply is, as far as we know, unlimited—the assertion that quartz reefs became poorer in gold as they descend being as yet quite unproved, so that when the due combination of science and capital has been brought to bear upon the subject, there seems to be no reason why the auriferous quartz reef should not be followed as far as any other metal-bearing vein, as in the Cornish tin mines or in the silver mines of Mexico and Peru. Hence the author concludes that the supply of gold from Australia will probably continue to be large and regular.

Mathematical and Physical Section, Nov. 10th, 1859. Mr. T. Heelis read a paper "On Storms, with some attempt to ascertain their tracks in the neighbourhood of the British Islands, and their analogy to other Cosmical Phenomena."

MEETINGS FOR THE ENSUING WEEK.

MON.—*London Inst.*, "On the radiation and absorption of heat," by Professor J. Tyndall, F.R.S., at 7 p.m. TUES.—*Nat. Civil Engineers*, Continued discussion on Mr. Grantham's paper "On Arterial Drainage and Outfalls." At half-past nine the visitors will adjourn to the library, when candidates will be balloted for.

WED.—*Royal Inst.*, "On the Physical History, Structure, and Materials of the Earth," by E. W. Brayley, Esq., F.R.S., at 7 p.m.

SOCIETY OF ARTS, "On the forces used in Agriculture," by Mr. J. C. Morton, at 8 p.m.

THU.—*Royal Society*, I. "On the Analytical Theory of the Attraction of Solids bounded by the surfaces of a class including the Ellipsoid," by Prof. Donkin; II. Supplement to a paper on the Thermodynamic Theory or Steam Engines with dry saturated steam, and its application to practice," by Prof. Rankine; III. "On the effects produced in Human Blood by Sherry Wine," by Dr. Addison; IV. "Supplement to a paper on the influence of White Light of the different coloured rays, and of darkness on the development, growth, and nutrition of animals," by Mr. H. Dobell, at 8.30 p.m.

FRID.—*London Inst.*, "On certain principles of vegetable and animal chemistry," by F. A. Malpas, Esq., F.C.S., at 7 p.m.

EXPERIMENTS ON THE STRENGTH OF CAST IRON GIRDERS.

By J. G. LYNDE, M.I.C.E., F.G.S.

THE following paper was read at the Manchester Literary and Philosophical Society, Nov. 1, 1859.

The beams experimented on were eighty-nine in number, and were cast by Mr. Mabon, at the Ardwick Iron Works, Manchester, from iron of the following descriptions:—

- One charge of the cupola consisted of
- 12 cwt. Goldendale, Staffordshire.
 - 12 " Lane End.
 - 12 " Ormesby, Yorkshire.
 - 12 " Blair, Scotch.
 - 12 " Calder, "
 - All No. 3 hot blast iron.
 - 12 " scrap.

The beams were cast on their sides, and were a very good sample of workmanship.

The section of each beam was of the form recommended by Professor Hodgkinson, and upon which his formulæ were based; the total depth of the beam in the centre was 24½ inches, and at the ends 20 inches; the bottom flange was 15 inches wide, and 2½ inches thick; the vertical part of the beam was 1½ inch thick; and the top flange was 4½ inches wide, and 1½ inch thick; the total length of the beam was 34 feet 6 inches, and the distance between the supports was 30 feet 9 inches; the weight of the beam was 3 tons 8 cwt. 1 qr.

One of the beams was tested up to the breaking weight with the following results:—

With a load in the centre of—

Tons. Cwt.	Inch.
31 8	the deflection was .87.
42 16	" 2.00.
46 12	" 2.25.
50 8	" 2.56.
54 4	" 2.70.
58 0	the beam broke,

the ends springing back from each other 2 feet 3 inches, the fracture indicating a good sound casting.

There was no permanent set observable in any of the experiments, until the breaking weight was applied, the beam being allowed to recover itself on the removal of the load in each case.

Each of the remaining beams was tested with a load of 20 tons in the centre, the deflection varying from ½ths to ⅞ths of an inch.

The calculations for the strength were based on the following formulæ, given by Professor Hodgkinson in his "Experimental Researches on the Strength and Properties of Cast Iron:—"

First formula, art. 146:

Let W = the breaking weight in tons placed on the centre of the beam,

a = the area of the bottom flange in inches,

d = the total depth of the beam in inches,

l = the length between the supports in feet,

$$\text{then } W = \frac{2.166 a d}{l}$$

In this case $a = 36$,
 $d = 24.25$,
 $l = 30.75$,

which gives 60.09 tons as the breaking weight of the beam.

The second formula, art. 147, takes into account the thickness of the vertical part of the beam, and is as follows:—

Let W = the breaking weight in tons placed on the centre of the beam,

l = the length between the supports in feet,

b = the breadth of the bottom flange in inches,

b' = the thickness of the vertical part in inches,

d = the whole depth in inches,

d' = the depth from the top of the beam to the upper side of the bottom flange in inches,

$$\text{then } W = \frac{2}{3 d l} (b d^2 - (b - b') d'^2)$$

In this case $l = 30.75$,
 $b = 15$,
 $b' = 1.5$,
 $d = 24.25$,
 $d' = 22.03$,

which gives 62.19 tons as the breaking weight of the beam.

The actual breaking weight being 58 tons, it would appear that the constant co-efficient assumed is in each instance too high for the quality of iron of which these beams were cast. This result appears to have been anticipated by Professor Hodgkinson in the case of large beams; and in one of his experiments, art. 147, on a beam cast for Messrs. Marshall and Co., of Leeds, he gives .625 as the co-efficient, which agrees with the result of this experiment.

Applying this co-efficient to Professor Hodgkinson's formulæ, they will be as follows:—

$$\text{First formula, } W = \frac{2.05 a d}{l}$$

$$\text{Second formula, } W = \frac{.625}{d l} (b d^2 - (b - b') d'^2)$$

The first of these would give 58.2 tons, and the second 58.31 tons, as the breaking weight; either of which calculations would be sufficiently correct for any practical purpose.

ON THE ANGLE OF DOCK GATES AND THE ROOF OF THE BEE'S CELL.

By CHARLES M. WILKIN, Actuary University Life Assurance Society.*

THE proper angle at which dock gates should be placed, so that the timber employed should yield the most favourable result, has often been discussed by mathematicians, and determined as a problem of maxima and minima. The angle has been found to be $109^\circ 28' 16''$.

A patient investigation of the properties of the cube has enabled me to succeed in dividing it into several geometrical solids, with which many definite and regular geometrical bodies may be constructed. The dodecahedron with 12 rhomboidal faces is composed of 2 cubes, 6 octohedrons, or 4 oblique rhomboidal cubes. The obtuse angle on its face measures $109^\circ 28' 16''$, being the same as that adopted by mathematicians for the angle of dock gates; and by Maclaurin in the beginning of the last century as the best for the angle of the roof of the bee's cell. It will be readily seen by the models submitted with this paper, that by elongating the dodecahedron, it becomes the precise form of the bee's cell, with angles measuring $109^\circ 28' 16''$.

I have succeeded in dividing or parting the cube in two different ways. 1st. By lines from the centre to the 8 solid angles of the cube, which will give 6 four-sided pyramids. 2nd. By lines from one of the upper angles of the cube, drawn diagonally to the 3 opposite angles, dividing the cube into 3 equal and uniform solids. Each of these solids being halved forms a left and a right-handed solid. These 6 solids, though equal in solidity, differ so far in shape, as 3 are left-handed and 3 right-handed, in the same way as the hands of the human body.

Each of the six bodies obtained by the second mode of partition may be divided into two of equal solidity and of similar shape. Two of these bodies, each being one-twelfth of the cube, may be so united as to produce the pyramid obtained by the first mode of partition. Six of these bodies, each being one-twelfth part of a cube, may be so arranged as to form the oblique rhomboidal cube.

It may also be observed that the pyramid, or one-sixth of the cube obtained by the first mode of partition, may be divided into four bodies, each of which is one-third of a cube containing one-eighth of the mass of the cube from which it was derived. So that, in fact, we may go on dividing and reproducing bodies of a similar shape, and still retaining the diagonal lines of the cube. How far this subdivision may be carried in nature, or how much farther than our powers of vision go, I will not at present venture an opinion. We can imagine the commencing atoms may be infinitely small, when we remember the wonders revealed by the microscope.

List of Models accompanying Mr. Wilkin's paper.

No. 1. Model of bee's cell, composed of seven rhomboidal cubes. By taking away 3 of these cubes,

the dodecahedron with rhomboidal faces is left, as composed with 4 rhomboidal cubes. The solid content of the dodecahedron is equal to two cubes, whose side is equal to the shortest of the diagonal lines of the rhomboidal face.

No. 2. The rhomboidal dodecahedron as composed with six octohedrons.

N.B. The cubic octohedron with which the dodecahedron is composed, is not the regular platonic body with eight faces, which are equilateral triangles, and which may be obtained by a partition of the tetrahedron; but this cubic octohedron has each face with two angles of $54^\circ 44' 08''$, and one of $70^\circ 31' 44''$, being, in fact, one-half the rhombus on the face of the dodecahedron. This octohedron is composed of two of the six pyramids into which a cube may be divided, as seen by the model.

No. 3. Cube marked with lines to show its partition into six bodies.

No. 4. Cube built up with the six bodies.

No. 5. Two of No. 4. united to form one-third of a cube.

No. 6. One of these bodies of which No. 4 cube is composed, being one-sixth of a cube divided into two, A and B, each being one-half a pyramid or one-twelfth of a cube.

No. 7. A rhomboidal cube, composed of six half-pyramids. Seven of these rhomboidal cubes form the bee's cell (see No. 1), and four form the dodecahedron.

No. 8. Pyramid, being one-sixth of a cube or one-half of the cubic octohedron.

No. 9. Pyramid, divided into four bodies.

N.B. No. 8 and 9 together form the cubic octohedron.

No. 10. One-quarter of a pyramid divided and re-united so as to form one-third of a cube, which is one-eighth of the solidity of the cube from which the pyramid was derived.

N.B. This body is of the same form as No. 5; but only one-eighth of the solidity. No. 10 may also be produced at once by dividing the pyramid into four of these bodies, by quartering across instead of diagonally; so that the one-eighth part of the pyramid unites either way to form the quarter of the pyramid, cut diagonally or across.

No. 11. To show that by the union of the half-pyramids a prism may be formed.

THE INVENTION OF THE HOT-BLAST USED IN IRON-MAKING.*

THE following history of the invention of the hot-blast used in iron-making was recently presented to the Institution of Mechanical Engineers in a speech by Mr. Neilson, the inventor of the hot-blast system:—

Six or seven years before he brought out the plan, he had read a paper before the Glasgow Philosophical Society on the best mode of taking out the moisture from the atmospheric air in summer time, previous to its entrance into the furnace through the tuyeres; for it was found that the make of iron was much impaired in summer weather both in quality and quantity, and he had become satisfied that the cause lay in the greater proportion of moisture contained in the air at that season. His first idea was to pass the air through two long tunnels containing calcined lime, so as to dry it thoroughly on its way to the blast cylinder of the blowing engine; but this plan was not put to trial. About that time his advice was asked by a friend, Mr. James Ewing, of the Muirkirk Iron Works, in regard to a blast furnace situated at a distance of half-a-mile from the blowing engine, which did not obtain a sufficient supply of blast at that distance, and consequently did not make so much iron as two similar furnaces situated close by the same engine; and it then occurred to him that since air increases in volume according to its temper-

* Read before the British Association at Aberdeen, September 20, 1859.

* The publication of this article has been unavoidably delayed for several weeks.

ture, if it were passed through a red-hot vessel before entering the distant furnace, its volume would be increased, and it might be enabled to do more duty in the distant furnace. Being at that time engaged in the Glasgow gas works he made an experiment at once on the effect produced upon the illuminating power of gas by a supply of heated air brought up by a tube close to the gas burner; and found that by this means the combustion of the gas was rendered more perfect and intense, so that the illuminating power of the particles of carbon in the gas was greatly augmented. He then tried a similar experiment with a common smith's fire, by blowing the fire with heated air; the effect was that the fire was rendered most brilliant, with an intense degree of heat, while another fire blown with cold air showed only the brightness ordinarily seen with a high heat. Having obtained such marked results in these small experiments it then occurred to him that a similar increase in intensity of combustion and temperature produced would attend the application of the same plan on a large scale to the blast furnace; but his great difficulty in further developing the idea was that he was only a gas maker, and could not persuade ironmasters to allow him to make the necessary experiments with blast furnaces at work. At that time there was great need of improvement in the working of blast furnaces, for many furnaces were at a stand for want of blast, being unable to maintain the necessary heat for smelting the iron; and unless as much as £6 per ton could be obtained for the iron no profit was realised, on account of the heavy expenses attending the furnaces. A strong prejudice was felt against any meddling with the furnace, and a kind of superstitious dread of any change prevailed, from the great ignorance of furnace managers with respect to the real action going on in the furnace, and the causes of the fluctuations that occurred; when a furnace was making No. 1 iron no one would be allowed to touch it, for fear that if any change took place it might be many weeks before the furnace got round again from white iron. He at length succeeded, however, in inducing Mr. Charles MacIntosh of Glasgow and Mr. Colin Dunlop of the Clyde Iron Works to allow him an opportunity of trying the application of heated air for blowing a furnace; and though the temperature of the air was raised but little, not more than about 50° Fahrenheit, he was glad to be allowed to make a trial even with so small an amount of heat. This first imperfect trial of hot blast, however, with a rise of temperature of only 50°, showed a marked difference in the scoria from the furnace, causing it to be less black, or containing less iron; and he was therefore anxious to try the plan on a more extensive scale, in order to satisfy himself as to the change in the make of iron, and to establish the correctness of the principle. He was still retarded by the strong objections of ironmasters to any alterations in connexion with the furnaces, which prevented him from making the necessary experiments for ascertaining the best way of carrying out the plan: in one instance where he had so far succeeded as to be allowed to heat the blast main, he asked permission to introduce deflecting plates in the main, or to put a bend in the pipe, so as to bring the blast more closely against the heated sides of the pipe, and also increase the area of heating surface, in order to raise the temperature to a higher point; but this was refused, and it was said that if even a bend were put in the pipe the furnace would stop working. These prejudices proved a serious difficulty, and it was two or three years before he was allowed to put a bend in the blast main; but after many years of perseverance at the subject he was at length enabled to work out the plan into a definite shape at the Clyde Iron Works, as had been so completely and correctly described in the paper that had been read. The invention of the hot blast consisted solely in the principle of heating the blast between the engine and the furnace, and was not associated with any particular construction of the intermediate heating apparatus; this was the cause of the success that had attended the invention, and

in this respect the case had much similarity to that of his countryman James Watt, who, in connection with the steam engine, invented the plan of condensing the steam in a separate vessel, and was successful in maintaining his invention by not limiting it to any particular construction of condenser. He was glad of this opportunity of acknowledging how firmly the English ironmasters stood by him in the attempts made in the early time of the use of hot blast to deprive him of the benefits of his invention; and to them he was indebted for the successful issue of the severe contest he had then to go through.

HELP FOR SEAMEN.

It being pretty generally known that we include very many naval gentlemen and persons more or less connected with the navy among our readers, we are not unfrequently brought in contact with nautical affairs. Among other objects of interest the sailors' home and refuge for shipwrecked mariners, at Great Yarmouth, has lately come under our notice, and we think it not altogether beyond our duty to say a word in its favour.

In no part of the world are there so many shipwrecks as on the east coast of England. During the year there were no fewer than 600 casualties between Dungeness and the Pentland Firth; being more than 50 per cent. upon the whole number on the entire coast of the United Kingdom. This very large proportion is attributable to the vast number of ships passing and repassing along these shores. It is calculated that not less than 40,000 sail, exclusive of vessels engaged in our fisheries, annually pass and repass through Yarmouth Roads; most of them being engaged in carrying the produce of our collieries to London and other markets. This Roadstead is the only natural harbour of refuge on the eastern coast, and it is not uncommon to see many hundreds of vessels there at the same time; whilst on some occasions a long continuance of adverse winds, either way, will cause a much larger number to remain at anchor.

But Yarmouth Roads are surrounded by a natural breakwater of very dangerous sands, which in foggy weather, or when heavy gales sweep the coast, occasion many fearful shipwrecks. During the last three years more than 500 vessels were stranded, wrecked, or lost off this coast, or compelled to put into Yarmouth harbour with damage. As a necessary consequence the loss of life is also great; and the number of shipwrecked mariners who are landed at Yarmouth, year after year, is very considerable. The benefits which "The Shipwrecked Fishermen and Mariners' Benevolent Society" has rendered at Yarmouth have long been gratefully acknowledged, but it has also been felt that something more was required. The survivors of a wreck or the crew of a foundered vessel, are brought on shore always wet and weary, frequently exhausted by cold and hunger—often more dead than alive. There was no place to which they could be carried but the public-house, where it was impossible to obtain, on the instant, those appliances which were so necessary to restore suspended animation, and such other remedies as circumstances required. To obviate this evil an Institution was founded at Yarmouth about twelve months since having for its object the social and moral improvement of the fishermen, beachmen, and seafaring population of the town; and combining the advantages of a sailors' home (so far as they are required here) and especially providing a place of refuge for the shipwrecked and destitute mariners of all nations. 288 shipwrecked and distressed mariners have already been received and relieved. Of this number 204 were British seamen and 84 foreigners of all nations.

The inadequacy of the present establishment has, however, been made most painfully apparent during the recent gales which have desolated our coast. In twelve days only, 109 shipwrecked mariners were brought to the Home, and relieved so far as the present limited resources would permit. In order, therefore, to meet the very urgent demands now made upon the committee it has been proposed to erect upon a most eligible site,

fronting the sea, lately granted by the Town Council for the purpose, a building fitted with baths and all other necessary appliances, to which shipwrecked mariners can be brought at any hour of the day or night, and at which there will be the certainty of finding all things necessary to restore them to health and strength; and it is firmly believed that by such means many a valuable life (as has already been the case in three instances) may be saved. At a public meeting lately held in the town hall, it was determined to appeal to the humanity and generosity of the public generally to assist the inhabitants of Great Yarmouth in establishing an institution which may be considered as partaking of a national character.

The Mayor of Yarmouth, who has brought this subject to our notice, has generously offered to receive donations; and we doubt not many readers of ours will gladly aid a cause which, at the present time especially, deserves the good wishes of our countrymen. We hope we need not apologise for devoting a few lines to such an object.

IMPROVEMENT IN THE VOLTAIC PILE.

It is well known that Bunsen's pile, which is but a modification of Grove's, consists of a glazed vessel, containing a cylindrical element of zinc, which surrounds a porous vessel filled with strong nitric acid, into which a charcoal cylinder has been introduced, the liquid in the outermost vessel consisting of water acidulated with about 10 parts of sulphuric acid. Now, although this is a most powerful combination, and in general use, it has two great inconveniences: first, the quantity of nitrous vapour it evolves is highly unpleasant, and may become dangerous; and, secondly, the current produced is not of constant intensity. M. Thomas has just communicated to the Academy of Sciences a modification which he has effected in this kind of pile, and which would seem to be quite free from the inconvenience alluded to. M. Thomas, in fact, shows that the development of nitrous vapour is one of the chief causes which interfere with the constancy of the current, inasmuch as they attack the copper ribands forming the electrodes, and effect certain chemical combinations, which give rise to counter-currents, and thus impair the principal one. He therefore causes these gases, as they are evolved, to pass into a porous vessel, where they are decomposed. In this process a secondary current is produced which, by the peculiar construction of the apparatus, is turned to account, and tends to correct the inequalities of the principal current. This arrangement also prevents the pile from becoming dirty, as is the case with Bunsen's pile.

COMPOSITIONS FOR COATING IRON SHIP'S BOTTOMS.—The following paragraph has been communicated to the morning papers:—"A number of gentlemen interested in shipbuilding assembled recently in the Southampton Docks, to witness the result of an experiment which had excited some interest among persons of that class. In the early part of last May the Royal Mail Company's steamship *Atrato* was coated on the starboard side with M'Innes's green copper soap, and on the port side with Peacock and Buchan's pink composition, for the purpose of practically testing the relative merits of the two articles in keeping the bottom of the ship clean. On docking the *Atrato* for examination it was found that the starboard side was covered with coral pipe, shells, and barnacles, with a good deal of corrosion; while the port side was perfectly free from coralline incrustation or barnacles, having merely a thin slimy unctuous coating upon it. The result is considered as having incontestably proved that preparations of copper are of little value in preventing incrustation or fouling on the bottoms of iron ships, while their galvanic action must, sooner or later, prove injurious to the rivets and plates. The green composition is now being scraped off the *Atrato*."

CAPTAIN NORTON'S GOSSAMER CARTRIDGE FOR SMOOTH-BORE GUNS.

THE above is a sketch of Captain Norton's gossamer cartridge, with spherical ball attached, intended to be used with smooth-bore shot guns, double or single, fitted with ordinary patent breeches, and so utilise arms of that description in case of emergency. The tapering form of the cartridge allows it to enter freely into the chamber so as to bring the small end as closely as possible to the communication from the nipple. Both the bullet and powder cartridge are covered with cotton net, and the stiffness necessary to preserve the general form of the completed cartridge is gained by pasting a strip of thin paper around it in such a manner as to leave each end exposed. Curtis and Harvey's improved "Large grain powder" has been found to be best suited to these cartridges. The net surrounding the bullet will retain any lubricating matter which may be preferred, and so facilitate loading and prevent leading of the barrel.

POUPARD'S IMPROVED WHEEL-SKID.

MR. WILLIAM POUPARD, Engineer, of the Blackfriars-road, Southwark, has lately introduced an improved wheel-skid or shoe, which many persons think highly of. He forms his skid with a tail piece extending backward from the wheel-chamber so as to form an inclined guide or path for the wheel to follow on entering the skid. This tail piece may be carried entirely through to the front of the shoe, and he prefers to form it of wrought-iron or steel, while the body of the shoe may be made of cast or wrought-iron. He finds the best results to be obtained when the projecting tail piece is curved upwards, but he does not limit himself to so shaping it. Fig. 1 of the

accompanying engravings is a side elevation of a wheel-skid or shoe, constructed according to his invention, and Fig. 2 is a section through the line *ab* of the same. *A* is the body of the skid or shoe, which is attached in the ordinary manner to a chain *B*; *B'* *B'* are sides or side pieces forming a chamber for the wheel; *C* is the tail piece, made by preference of steel or wrought-iron, and riveted or bolted to the body *A*, as shown by the dotted lines in Fig. 2. He prefers to form the tail piece of a curve to correspond with the contour of a wheel, but this shape can be varied without departing from the essential features of the invention. Fig. 3 shows a wheel just entering the skid; to provide for this raise the chain *B*, which brings the tail flush or nearly so with the ground, and allows the wheel to run in; let go the chain, and the wheel comes to rest in the skid. The improved skid is now being made in large quantities.

CHAPLIN'S STEERING APPARATUS.

AT a recent meeting of the Institution of Engineers in Scotland, Mr. Neilson explained the construction and working of Mr. Chaplin's steering apparatus, several models of which were exhibited. The improved steering apparatus is more particularly destined for flat-bottomed boats of light draught for shallow waters. The steering is effected by means of vertical plates disposed obliquely at either end, or at both ends, of the vessel, in the manner shown in Figs. 1 and 2,

which are respectively an elevation and the plan of the stern of a boat fitted with the plates. There are two steering plates, *A*, one on each side of the vessel; and they work in vertical casings, the positions of which are indicated by dotted lines at *B* in the plan, Fig. 2. Each plate, *A*, turns on a joint at its front end, and when not required to turn the vessel to the side it is on, is drawn up within its casing. Independently of their peculiar suitability for flat-bottomed boats, these plates have a greater control and act more quickly than the ordinary rudder, from their being placed on each side of the centre line of the vessel. A pair of the plates at one end is sufficient for ordinary requirements, whilst for intricate navigation a pair at each end may be used, to be actuated either simultaneously or separately.

Mr. Downie asked, at what angle the steering plates were set, and whether they had ever been practically tried; and, if so, with what result? Mr. Chaplin said that whilst various angles might be adopted, he preferred that of 37° from the line of the keel. The plates had been successfully tried. He understood that seventeen boats were being or about to be built in England with steering plates on the same plan as that described, being chiefly for the Government. On trying the steering plates in a small boat, it was found that when plates were acting on the same side at both ends, the boat turned round on a radius equal to its length. Another modification had been applied to a vessel built by his firm, and sent to Java, consisting of a simple conical shell oscillating on an axis, a piece being cut out of the cone, and one side or other being made to project as required; but this was only suitable for small vessels, where the apparatus was not to project through the deck. The vessels which he mentioned as in course of building were to draw 2 feet water, to carry 1,000 men, and coals for a voyage of 50 miles. They were 220 to 240 feet long, and 35 to 40 feet beam, and almost perfectly flat. They were, he understood, intended for the navigation of the Ganges, and other rivers of India. The steering apparatus was adapted as well for deep sea vessels as for those of shallow draught; and for screw

vessels it was peculiarly fitted, for the screw could be fitted between the plates. In the event of any injury being sustained by one of the plates, it could be hoisted on deck without trouble and repaired. If the steering plates were projected, one at each end of the vessel on opposite sides, and so as to be parallel to each other, the vessel would move in a lateral direction, and would be easily brought alongside of a pier.

AULD'S APPARATUS FOR SUPPLYING STEAM BOILERS WITH WATER.

MR. DAVID AULD, of Glasgow, Engineer, has just patented the "automatic mechanical arrangement for the efficient supplying of steam boilers with water, so as to ensure both a plentiful supply and certainty of action," which is represented in the annexed engravings. Fig. 1 is a partially sectional elevation of one modification of the apparatus. Fig. 2 is a partially sectional elevation of another modification of the apparatus, in which the several parts are arranged in a somewhat different manner. In the first arrangement, Fig. 1, the water for the supply of the boiler flows into the apparatus from an elevated tank or reservoir through the feed-pipe which opens into the valve chamber *A*, the efflux of the water being prevented by the clack-valve *B*, which closes the entrance to the valve chamber upon the occurrence of back pressure on the water. From the valve-box the water flows into the chamber *C*, and thence upwards into the cup-shaped chamber *D* above; the chamber *C* has two flanged tubular openings in the lower part, which serve to connect the apparatus to the steam-pipe *E* and the pipe *F*, through which the water flows into the boiler *G*. The steam-pipe *E* is carried downwards into the boiler to the proper water level, and the water-pipe nearly to the bottom. The flow of steam through the pipe *E* is controlled by the valve *H* which is pressed up against its seating by the pressure of the steam within the boiler, and is prevented from falling away too far therefrom by the small bridge-piece *I*, which extends across the steam-pipe. The inlet to the pipe *F* is in like manner controlled by the valve *J*, which rests upon the bridge-piece *K*, during the time that the water is flowing into the boiler. The tubular seating of the valve *H* is made conical at the upper part to receive the lower extremity of the tube *L*, which passes up through the chamber *C* and *D*, and enters the copper globe *M*, terminating near its upper part. The tube *L* is fixed in position by the angular stays *N*, the lower bent extremities of which are bolted to the globe *M*, the bolts serving also to connect the globe to the short flanged pipe *O*, which slides loosely in the opening of the cap *P* of the chamber *D*. This cap is bolted to the flange of the chamber *D*, a diaphragm of india-rubber or other suitable flexible material being interposed between the faces of the flanges; the inner part of this diaphragm is held between the flanges of the pipe *O*. With this arrangement the water cannot escape, at the same time the pipe *O*, carrying the globe *M*, is free to slide up and down in the opening in the cap *P*. The globe *M* is formed in two parts which are bolted together, and at the upper part there is an eye by means of which it is attached to the chain *Q*, which is secured by a nut to the upper extremity of the segmental part of the balanced lever *R*. The segmental part of this lever is hollowed out like a grooved pulley, and at the central part of the lever there are laterally projecting knife edges similar to those of a scale beam. These knife edges rest upon a hardened steel plate, which is supported in slots made in the forked extremity of the pillar *S*; this pillar is carried upon an overhanging bracket cast on the side of the chamber *C*. To the outer part of the rocking lever *R* is fitted an adjustable counterweight *T*, which is fixed at the proper distance from the centre by the set screw *U*. Arching over the centre of the lever *R* and its supporting pillar is a bridge-piece *V*, which is bolted to the lever *R*; this bridge-piece has a segmental slot made in it, in which are fitted two

AULD'S APPARATUS FOR SUPPLYING STEAM BOILERS WITH WATER.

adjustable sliding stops *W*. These stops serve to check the lateral motion of the vertical swinging rod *X*, the lower end of which is carried on a stud fixed in one of the upwardly projecting ends of the pillar *S*; at the upper part of the rod is fixed the weight *T*, which is fastened thereto by a set screw. The weight *T* is fixed at such part of the lever *R*, so that it counterbalances the weight of the globe *M* and its appurtenances, together with a certain quantity of water in the globe, the upholding action being assisted by the overhanging weight *Y* on the rod *X*. As the water flows in from the supply-pipe and up into the globe *M*, when it reaches a predetermined height therein, the accumulated weight overcomes the gravity of the weight *T*, so that the lever *R* turns upon its centre, and the weight *Y* is thrown forward against the right-hand stop *W*; this action facilitates descent of the globe *M*, the short pipe *O* descending into the cup-shaped chamber *D*, at the same time the transverse pin at the lower part of the tube *L* comes in contact with the upper end of the spindle of the valve *H*, and the end of the tube enters the conical part of the tubular valve seating. The depression of the valve allows the steam to pass up the tube *L* into the globe *M*, its pressure causing the air valve *Z*, which is otherwise kept open for the egress of the air as the water flows up in the globe, to shut. The pressure of the steam on the surface of the water in the globe causes the valve *J* to open, and the water flows down the pipe *F* into the boiler, the steam pressure serving also to close the valve *B*, which prevents the water being forced back through the feed-pipe. The inflowing of the water into the boiler continues until the globe *M* is so far reduced in weight that the counterpoise *T* is sufficient to overcome its gravity and that of the weight *Y* in its overhanging position to the right of the centre of the lever *R*. When this takes place the globe *M* is raised by the motion of the lever *R*; the valves *H* and *K* are closed by the pressure of steam in the boiler, and the apparatus is again restored to its normal position. In this manner the due and effective feeding of the boiler is kept

up with unerring certainty, the filling or partial filling of the globe, and the discharge of its contents into the boiler being regulated according to the evaporative power of the boiler.

In the modification shown in Fig. 2 the water from the overhead tank or reservoir flows through the vertical feed-pipe *a*, the lower part of which is closed by the valve *b*, which opens into the cast-iron water-chamber *c*; this chamber has fitted in the upper part a cock *d*, for the discharge of air from the chamber as the water flows into it from the feed-pipe *a*. The lower part of the chamber *c* is cast with two flanged tubular openings, by which the apparatus is attached to the steam-pipe *e* and feed-pipe *f*, which project out above the boiler *g*. The steam and feed-pipes are fitted with valves *h* and *j*, which when open rest on the bridge-pieces *i* and *k* in manner similar to the arrangement of the corresponding parts in Fig. 1. The spindle of the valve *h* is prolonged upwards so as to enter the lower extremity of the tube *l*, which is fitted in the centre of the cylindrical vessel *m*, the upper part of the tube being held in position by the transverse stay *n*. The vessel *m* is by preference made of copper, and it has at the lower part a valve *o*, by means of which the contents escape into the chamber *c* when the valve spindle comes in contact with the bottom of the chamber. The vessel *m* is connected by means of the bridge-piece and rod *p* to the chain *q*, which is attached to the segmental extremity of the rocking lever *r*. The arrangement of this lever and the parts connected therewith are in all respects similar to the corresponding parts delineated in Fig. 1, and do not therefore require further description. The water from the tank or reservoir flows through the pipe *a*, and falls into the vessel *m*, which when nearly filled descends to the position shown in Fig. 2, the descent causing the valves *h* and *o* to open. The steam having now free ingress to the chamber *c* through the tube *l*, its pressure closes the valve *b*, and acting upon the surface of the water, the valve *j* is opened, and the water flows into the boiler *g* through the pipe *f*. The flow of water continues

until the weight of the vessel *m* is sufficiently reduced to admit of its being raised by the counterweight *t*, and thus restored to its normal position. The upward motion of the vessel *m* is followed by the opening of the valve *b*, and the closing of the valves *h* and *j*, and the self-acting operation of refilling the vessel *m* again goes on.

"By means of either of these modifications of my improved automatic feed apparatus," says Mr. Auld, "the due supply of water to boilers is most efficiently provided for, at the same time the simple arrangement of the several parts almost precludes the possibility of derangement."

CLAYTON'S PATENT BRICK AND TILE MACHINERY.

We have been invited, prior to the opening of the Smithfield Club Show, to inspect the working of some brick and tile machinery just completed by Messrs. H. Clayton and Co., in accordance with their several patents, and which machinery will be exhibited in motion during the continuance of the show, partly in Baker-street, and partly at Messrs. Clayton's Atlas Works, Upper Park Place (within a few minutes' walk of Baker-street), where alone the larger machines can be shown; the space procurable in the Baker-street building being too limited to admit of the exhibition of any of the machines, excepting one worked by hand power, but which is yet capable of turning out several hundred bricks an hour, whether solid or perforated, or a proportionate quantity of tiles, drain pipes, or similar articles. Before describing in detail the late improvements made in Messrs. H. Clayton and Co's machines, we think it well to observe that much credit is due to these gentlemen for their untiring perseverance in introducing modifications in the details of their machines, which extended practice has from time to time suggested, and is ever certain to suggest when there is any disposition to profit by experience. The principle of "leaving well enough alone" is doubtless, as regards many things, a very safe one, especially when changes are made, as it were,

hap-hazard for the sake of appearances, rather than from any real desire to attain perfection; but this principle would appear to be held in very light esteem by Messrs. Clayton and Co., for notwithstanding many hundreds of admirable machines having during the last few years been constructed and set to work by them, sufficiently perfect to satisfy the wants of those using them, we find every year changes made in their details which evince on the part of their constructors an absolute mastery over the subject which they have made their special study—changes perhaps hardly noticeable by casual observers, but which, nevertheless, when cost of construction and durability are concerned, are of the very highest importance, and deserve, especially at our hands, a careful investigation and favourable notice. To make a machine which will sell, and to call it the best that is made, is one thing; but to make a machine really as well as it can be made before it is offered for sale, is quite another thing, but one which we fully believe Messrs. Clayton and Co. always attempt to do.

The points to which we now more especially desire to call the attention of our readers, relate first to the mode of driving the “roller” dies of the brick machines. Until recently these dies were driven *continuously* by means of straps, that is, they were in motion both when the clay was being passed through or rather between them, and also when the clay was stationary, which caused them to be unnecessarily worn by their rubbing against it. Besides this, the straps frequently slipped when accidentally wetted by the water used for lubricating the surface of the dies, which caused the dies to travel at different speeds, and which, to some extent, was injurious to the perfect formation of the clay. The roller dies are now, however, driven by *bevel-gearing*, which is carefully boxed up in order to keep it clean, and which is actuated at proper intervals only (when the clay is in motion) by a cam and lever worked from the main shaft. Again, the dies which are covered with a porous material (kept moist and clean by water supplied both to its back and face) were formerly *entirely* so covered, about one inch both at top and bottom continually rubbing against the ends of the upper and lower fixed dies, and which caused comparatively rapid wear. This evil is now got over by encircling the roller dies with brass hoops at top and bottom, leaving the covering material only exactly deep enough to equal the thickness of the brick. Lastly, the foundation of these roller dies on which the coating is lapped is now made of white metal which does not oxidise, even although the machine lies idle for several months, but which would immediately result from the contact of the wet covering with the rollers were they of iron. We now pass on to improvements made for ensuring an uniform tension of the cutting wires. Formerly a rigid bar carried the end of these wires, which were quite independent of each other, and were tightened up by hand as equally as possible; now, however, nearly perfect uniformity is secured by fixing the carrying bar rigidly at one end only, that is, by bending it at that end in the form of a right angle, and then by the tension produced in the wires, bringing the other end (fitted with a friction roller) down about an inch until it rests upon a curved cross-bar, and upon which the friction roller travels as the wires are moved from side to side. Another matter which we may here mention is, that the small pinions used in these machines are cut out of solid blocks of wrought-iron, instead of being cast. The importance of this can perhaps be appreciated only by those who have worked machinery subject to the same rough usage as brick machinery is, and more especially when worked abroad or even in some home districts where repairs cannot be readily effected.

Before concluding we would for a moment allude to the various attempts made to manufacture bricks from dry clay, by means of pressure. This mode of manufacture has been favourably looked upon in some quarters, from the idea that a considerable saving both in time and money could be made from the bricks requiring no drying pre-

viously to be being burned; but it has been completely overlooked that quite as much if not very much more time and expense are involved in preparing that clay before it is made into bricks, this preparation really necessitating great storage room, besides being very difficult, owing to the necessity for just so far drying the clay as to prevent it adhering to the moulds, and yet not so far doing it as to deprive it altogether of a tendency to cohesion amongst its particles. Space will not admit of our discussing the pros and cons of the dry and wet principles of brick making, but one point strikes us very forcibly, and that is that, from what we have seen the dry process requires very powerful, heavy, and expensive machinery, costing to the tune of £3,000 or £4,000, for making say 20,000 bricks per day; whereas, for about one-sixth of this sum wet brick machinery can be had of equal productive power. In other words, by the expenditure of the above sum, wet brick machinery may be procured (even after allowing for additional labour) of five times the productive power of that for making bricks on the dry process. The problem Messrs. Clayton and Co. set themselves to work on was—to make a clean and perfect block of plastic clay; and the product of their machines is assuredly the Q.E.D. It would be quite impossible in a notice like the present to do more than hint at the various machines Messrs. Clayton and Co. construct, suitable for manufacturers of bricks, either on a large or small scale, whether the machines be driven by steam, water, animal, or manual power, and whether intended for solid and hollow bricks alone, or for these as well as tiles, drain-pipes, and similar articles. Suffice it to say, that at the present time, having devoted considerable time to the subject and had much experience in fitting up brick manufactories, these gentlemen are enabled to supply all and every requisite for the thorough organisation of brick or similar clay ware works, including plans for the laying out of the works, the construction of the kilns, drying sheds, &c., and, moreover, advise on the selection of the sites for the erection of the works themselves. The production of “bricks, whole bricks and nothing but (good wet) bricks,” has been the form of asseveration made by Messrs. Clayton and Co., any day these last five and twenty years, and as brick and tile masters they still stick to their “leather.” Of machines lately ordered of Messrs. Clayton and Co., we may mention as many as twenty for the Government for India, while of those now exhibiting one is for Prince Bariadinsky, another for Prince Potenkin, and a third for Prince Demidoff for his mines in Siberia. There is also a large machine for Venice, and an order of some 20 machines is shortly to be completed for Bombay. With respect to special machines we must not omit to notice the new one for the manufacture of very large drain pipes or gas retorts. This machine is so constructed that the core or piston is not supported by any cross-bar, which would of course divide the stream of clay issuing from the machine, and which strain would not completely unite in a short distance, thus causing the pipes to crack; but the core or piston is suspended from a long rod attached to the upper part of the machine, thus leaving the clay undivided in its way through the die plate. Several of these machines are at work. We may also mention an ingenious machine for making extra finished bricks by placing ordinary bricks when in a moist state under pressure (about 3 tons) given by a bob lever and weight worked by hand, and which puts a fine polish on the surface of the bricks, besides stamping any device upon them if required. The mould is in this case kept lubricated by a layer of cotton saturated with oil, being placed between two plates which together form the lower piston of the mould.

We regret to learn that many of the improvements really invented and patented by Messrs. Clayton and Co., and so successfully introduced into their brick machinery, have like many other good things become imported into the productions of rival manufacturers so soon as their success has been established, and it has even

happened that prizes at our agricultural shows have been, perhaps unwittingly, awarded to those who have simply adopted Messrs. Clayton and Co.'s principles in the construction of their machines.

Lastly, we may as well state that Messrs. Clayton & Co., besides manufacturing brick making machines and brick factory fittings of all kinds whatever, have successfully introduced a green crop mower, which has given great satisfaction. The guide bars of this mower are very beautifully formed in the shape of the letter Y, the upper portion not being solid as is usually the case, but consisting of two prongs with an open space between them, which allows of any matter which becomes clogged to free itself immediately and so preserve the cutting edge of the knife. We will only add that the manufacture of bricks by means of the various machines now made to facilitate it (not forgetting an ingenious one for ridding the clay of stones by a process of straining the clay through a comparatively finely perforated plate) may be carried on as cleanly and as comfortably as the manufacture of bread *might* be. Those horrid red-headed and dusty, unrecognizable individuals so frequently seen in ordinary brick fields are fast going out of date, and their places supplied by others much more human in appearance, who can perform their labour without literally wallowing in the mire.

STEAM-SHIP ECONOMY.

TO THE EDITORS OF THE “MECHANICS’ MAGAZINE.”

GENTLEMEN,—The objection to the formula which Mr. Atherton and the committee of Section G of the British Association have adopted as the test for economical performance in the steam mercantile navy, rests on the ground, first, that the $\frac{2}{3}$ power of the displacement is improperly employed in place of the midship section—for that this is its purpose is now avowed by Mr. Atherton—such factor being an imperfect factitious substitute thereof, a mere mathematical expedient in lieu of the reality. It is true, as suggested by Mr. Atherton, that the one will be as proper as the other, or that the midship sectional areas will vary exactly with the square of the cube root of the displacement, *when* the bodies immersed are similar in form and general proportions; but it is precisely because vessels are dissimilar in those respects that any formula is of any use at all beyond determining the comparative efficiency of propellers, engines, and boilers, instead of the comparative merits in the build of ships, and beyond ascertaining the effect of mere size. The formula in respect to its ostensible existence commits through its accuracy a *felo de se*. Even as to its remote and limited ability, there would exist no reason for preference, no difference in result between the formula in terms of midship section or in terms of displacement, if this statement of substitution and identity be accepted. That Mr. Atherton should have conceived the possibility of my “questioning the geometrical fact” on which the substitution is founded, could only have arisen from the printer's error, of making me say that the $\frac{2}{3}$ power of displacement is a factitious instead of a factitious thing; but of course your correspondent does not require to be told that such substitution must necessarily be false and misleading, when the condition for the truth of the “geometrical fact” is wanting, namely, that the bodies be similar. So much for the erroneousness of the formula as being based on the midship section “in terms of the displacement.”

But secondly, and principally, the objection to it rests on the ground of its being wholly inappropriate to the purposes which it professes to serve among merchant steam-vessels, namely, to test their carrying capacity in relation to speed and power; and this objection is equally valid, although we base the formula on the true midship section, instead of making the $\frac{2}{3}$ power of the displacement do duty for it. All the information that can be obtained by it is the velocity in relation to power when the area of resistance is constant, or the area when the velocity is constant, of which the only item that is useful is the

velocity. The carrying capacity in combination with speed is completely ignored, nor can it even be conjectured from the midship section, for the one might augment, or it might diminish, with the augmentation or with the diminution of the other. What, then, is the use of this formula as applied to merchant vessels in their character of transports of merchandise? Mr. Atherton says that I "admit the applicability of the formula based on the midship section," which I certainly do, but only for the purpose I stated, namely, of obtaining the comparative worth of the lines of vessels through the velocities attained with a definite amount of power, and consequently the comparative worth of merchant-ships, in their character as passenger vessels primarily. Here the useful effect contemplated is merely velocity, and this the formula indicates, and this alone; but if we would view it and value it conjointly with the amount of goods carried, we must approximate thereto through a formula based on the displacement simply, as I have heretofore explained. Indeed I cannot think that the author of the formula under animadversion, whoever he is, intended merely "to express the midship section in terms of the displacement," but wished, although making a *muddle* of the thing, to mix up with it the element of tonnage. Mr. Atherton does not attempt to defend the appropriateness of the formula; would it not then have been as well to have acknowledged at once that it is indefensible? I beg to assure him that I intended exoneration, and not an inuendo, by saying that from what I could understand he was not the author of it. It seems I might have learnt in his own writings that he has disclaimed any such honour, but I have not had the pleasure of other acquaintance with them than through your pages.

Yours, &c., BENJAMIN CHEYERTON.

UNSINKABLE SHIPS AND RAFTS.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—Mr. Atherton evidently imagines that in proposing to construct unsinkable ships he has made a valuable discovery. He seems, however, to be satisfied with the principle, apart from any consideration as to the obstacle which may stand in the way of its being practically applied; and he leaves to others the task of maturing the invention, so that vessels may be built which will defy shot and shell, wind and waves. I presume that those who will succeed in fulfilling these requirements will deserve as much credit as the inventor; possibly, however, Mr. Atherton will compete for the prize which is to be offered by the Society of Arts, and consequently may succeed in keeping all the credit to himself—and which he will most certainly deserve. So far, the invention has been but vaguely defined. In the first place, we are favoured with a ship which is to be a solid mass up to the water line; and that such a ship would float under all circumstances, there is no room to doubt; but what have we to prevent it from floating keel upwards? and from sending its dead and living cargo into the depths of the ocean? We have an answer, or that which may be supposed to be intended as an answer, from Mr. Atherton, in the form of an explanation, in the last number of the *MECHANICS' MAGAZINE*;—the machinery is to be placed below the water line. This I suppose includes the boilers, fuel, &c. Perhaps it will also be found essential to make room considerably below the water line for the powder magazine; for shot and shell; and by this time we shall find the ship, the solid mass, tolerably well ballasted. But will he not admit the necessity of scooping out of the mass a spacious "cock-pit," in which the surgeon will be in no danger of having his head knocked off by a stray shot, while amputating the limb of a naval hero?

Clearly there is no necessity for building new ships before adopting Mr. Atherton's invention. In order to test its value, all that is required is to select a line-of-battle ship—an old hulk; let the hold up to the water line be filled up with some light, water and fire-proof substance, with the exception of the spaces above enumerated;

then let the attempt be made to scuttle it during a gale, fifty miles S.W. of the Land's-end, and if all attempts to do so should fail, then, and not till then, will Mr. Atherton have proved the practicability of adapting his invention for purposes of naval warfare.

I have been engaged during some time in attempting to discover a plan for saving not ships, but human life, when the destruction of a ship becomes inevitable. The small boats usually found even in large vessels are, in nine cases out of ten, useless. They founder, or are dashed to pieces against the ship, as soon as they are filled with human beings. The plan which I propose as a substitute for existing arrangements, is applicable to all existing ships, without incurring any great expense. I would suggest that every ship should be furnished with an upper moveable deck, which could be unshipped, and made to answer the purpose of a raft. This deck-raft, if I may so term it, would be fastened to the ship only by means of screw-bolts, which could be easily removed, but as the masts would pass through it, it would at all other times form an immoveable portion of the vessel. The bulwarks might be connected with the upper deck, but the rigging would be fastened to the ship. After losing all hopes of saving a vessel, the masts and rigging would be cut away, the screw-bolts removed, and the deck raft entirely disconnected from the hull of the vessel; the waves would soon set it afloat, and it might prove a life raft capable of saving hundreds of lives. In the loss of the Royal Charter, we have a melancholy instance of the want of provision for saving life; and such tragedies may be soon repeated, for cool heads and clear judgments are not always the attributes of commanders of vessels. The form of a vessel causes it, on drifting, to strike aground a few hundred feet from the shore; and it is in that narrow space of water that thousands of lives are annually lost. Is it too much to assert that had the Royal Charter been furnished with a deck-raft none on board would have perished? I think not. Several hours passed between the ship being run on shore and her breaking up. This would have allowed the raft to be unshipped, and the passengers to be transferred to it; when being flat, it would have been thrown by the waves within a few minutes high upon the beach.

In the case of large vessels, more especially steamers, I would construct the deck-raft in two sections, the division being near the funnel. This would give great facilities for launching it on the waves, and in many instances one section only would be required. The raft should, of course, be constructed as firmly as any portion of the vessel, but as it would form the real deck, the planking beneath might be thinner than usual. As, however, it would be essential that water should never percolate between the two, I would propose to fasten some waterproof substance on the under part of the deck-raft. Vulcanized india-rubber, or kamptulicon, would be unquestionably the best, but the cost might be too great; and in that case, a rope matting saturated with tar might be used—or better still some light, cheap, water and fire-proof substance, not yet discovered; but in the discovery of which we may receive some valuable assistance from the Council of the Society of Arts. Such a deck would be valuable, independent of its ever being required for saving life, as it would muffle the sounds caused by dragging chains and heavy weights—sounds so disagreeable to passengers, as any one who has passed a few nights at sea during a gale can testify. Various modes of constructing the raft will suggest themselves to ship-builders, so that it might be converted into a ship should occasion require; and I hope that the idea will not be altogether discarded unless a more effectual plan can be devised for preventing the loss of so many valuable lives, frequently within a stone's throw of terra-firma.

I believe Mr. Atherton's invention admirably adapted for fishing-boats, but in its present form, it is not worth much. If his ambition will condescend to take a sufficiently humble flight, and mature his invention, he will accomplish as much as if he had built an unsinkable frigate. It would

prove invaluable to many brave fellows who pass their lives on the ocean, too many of whom find in it a grave.

I remain, gentlemen, very respectfully,
JOHN DE LA HAYE.

Perth, November 18th 1859.

SAILING.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—Suppose two ships sailing in the same direction, with a strong gale on the quarter, one of the old form aptly described as being built by the mile and cut in lengths, the other of the modern clipper form. The former is under reduced sail and goes ten knots, the latter carries on and goes eighteen knots; the spars of the former bend as though another foot of sail would break them, the latter shakes out the reefs as she gathers way, and sail is added without danger to the spars. If the pressure of wind at the time is ten pounds per square foot of stationary surface, the pressure on the former ship's sails would be about six pounds per foot, while the clipper's sails would only have to sustain 1.6 pounds per foot, her speed reducing the actuating force to that extent; and this accounts for the fact that captains of clipper ships carrying such a press of sail as they do in favourable gales, every foot of canvas added reducing the surface pressure, and adding to the speed without unduly straining the ship.

Two yachts of equal dimensions, differing in form, but of equal spread of canvas, sail a match. It is generally supposed that such a match is a fair one, and that they both carry the same power. This, however, is a mistake, and it is, in most cases, very unfair to the fleetest of the two, for she has to win the match with less power than the slower vessel, for the reason shown above.

Supposing, then, that ships are provided with ample canvas for favourable winds, with steam-power for calms and light winds, still there remains the fact that heavy adverse gales may and do arise when steam and sails are almost useless. When I heard of the wreck of the Royal Charter, I pictured to myself a large ship in this very position; yet I could not help thinking that the hurricane which proved such an enemy to her might, by suitable means, have been converted into a friend.

Reverting to my first illustration, it is evident that the two vessels can carry canvas in the proportion of 1 to 3.75 with the same amount of strain on each, and the effective horse-power used in propelling two ships may be represented as 1,000 in the case of the slow vessel, and 1,800 in that of the clipper.

It is evident, therefore, that to obtain great power from the wind a certain amount of speed of the propelled surface is necessary. A ship in a hurricane with a dangerous shore under her lee cannot, as ordinarily rigged, carry sufficient sail to realise the power to gain an offing; yet power is to be had in abundance, and to apply this power revolving vertical wind-screws* should be used capable of ready hoisting and lowering, and geared to either screw or paddle-wheels, by which an immense and cheap power can be applied, eclipsing both steam and ordinary sails, when working to windward in heavy gales.

I have made some calculations upon the subject, and I think that no vessel thus fitted need be lost on a lee shore; in fact, a head-wind may be regarded as a very valuable propelling power, instead of a hindrance to a vessel's progress. I propose that the wind-screws should be made to take a convenient form for housing on deck when not in use.

Suppose the Great Eastern to be thus fitted, I should make the radius of the wind-screw 40 feet, the pitch 120 feet; the screw could be lowered on deck and housed in a house built across the deck 81 feet long by 10 feet wide and 6 feet high, and could be hoisted in about 15 minutes. In a wind producing a pressure of 33 lbs. per square foot of stationary surface, every square foot of this screw

* Many persons would call them wind-mills, but the word *mill* is inapplicable.

would produce about $\frac{1}{3}$ of a horse-power, and, as the Great Eastern could conveniently carry 3 such screws, from 5,000 to 8,000 horse-power could be obtained without burning a pound of coal.

I do not claim to be the inventor of "windmills on deck," the plan was patented so far back as 1709, and most of the subsequent patents (many of them very absurd) are therefore wanting in novelty, and void. The plan is open to all, the wind is a cheap motor, the safety of lives and ships is important, and I believe the adoption of this mode of using adverse strong winds would greatly reduce the chances of shipwreck, and with it the cost of insurance, and tend to increase the speed and economy of transit.

I am, Gentlemen, your obedient servant,
T. MOY.

1 Clifford's-inn, Nov. 22, 1859.

MEANS OF RETARDING RAILWAY TRAINS.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—In last week's *MECHANICS' MAGAZINE* a letter appeared from Mr. Alexander Allan of the Scottish Central Railway, disclaiming the invention of the throttle in the blast pipe of the Locomotive Engine, and awarding the whole merit of its introduction into this country to Mr. Rudolph Bodmer, of London. I cannot suffer that statement to pass without calling attention to a letter I wrote on the subject, signed "A Constant Reader," and which appeared in vol. 14, of the *MECHANICS' MAGAZINE*, No. 383, and dated December 11th, 1830. As many of your readers may not be in possession of the *Magazine* of that date I give copy of the letter:—

"MEANS OF STOPPING LOCOMOTIVE ENGINES.

"SIR,—A few years since an accident happened at a colliery where I was the engineer; the break that runs up against the fly wheel broke, and it was not in my power to stop the engine in time. A few weeks after I put a throttle valve to the suction or waste pipe, where the steam escapes, and by shutting both throttle valves together I managed to stop the engine immediately. The moment the steam in the cylinder could not get out, the engine ceased to move. Now, Mr. Editor, might not a contrivance of a similar kind prevent such melancholy accidents as that which befel the lamented Mr. Huskisson at the opening of the Liverpool and Manchester Railway. I am aware of the momentum acquired by an engine in motion, and I do not say the means here suggested would meet that difficulty, but we are bound to do all we can to lessen the chances of such disasters; and I am sure that were the steam only brought under such perfect subordination, those chances would be reduced tenfold. Your insertion of these brief hints will much oblige,

"Your obedient servant,

"A CONSTANT READER."

Since the above letter appeared the adaptation of the throttle valve to the blast pipe has been patented by Mr. Booth, of the Liverpool and Manchester Railway, whose attention I then called to the invention; it appears also to have been since re-patented by Mr. Bodmer and Mr. Allan. Neither the invention nor its application is due to any of the three before-named gentlemen, but to your obedient servant,
J. HOPKINSON, Engineer.

Britannia Works, Huddersfield.

STEAM ROCKET PROPELLER.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—Will you allow me a little space to reply to inquiries of readers of the *MECHANICS' MAGAZINE*?

The steam rocket at a pressure of 1000 lbs. per inch will, I believe, give more propelling power than any marine engine from the same amount of fuel. The rocket tube might be formed of the required strength by being made of small diameter, and of a roll of metal welded together, or of thin tubes fitting tightly one over another, and to allow for the expansion of the metal each tube should be put on hot. The recoil of a gun is caused much more by the velocity and expansion of the discharge than from its immense pressure. Steam at

one-tenth the pressure has at least ten times the velocity and expansion of the gases from gunpowder; this difference arises from the greater elasticity of steam. Atmospheric air under the same pressure would have greater velocity and expansion, although not approaching to that of steam, water on the other hand being non-elastic would have less velocity, and, of course, no expansion, and therefore a discharge of water is greatly inferior to steam as a method of propulsion. Inattention to the differences in velocities of gases and their expansion is, I believe, one of the principal reasons why carbonic acid has not hitherto been worked to a successful result as a motive power. A steam rocket of 1 oz. propels a boat of 7 ft. laden with 20 lbs. With a properly constructed vessel I have no doubt a speed of 30 miles per hour may be obtained in smooth water.—Yours &c.,
JAMES PARKER.

Camberwell.

LONDON SEWAGE.

THE following letter explains itself, and deserves attention:—

TO THE EDITOR OF THE "TIMES."

SIR,—As none of your correspondents have questioned the statements made by Mr. George Shepherd, C.E., in his letter on the value of sewage to the farmers, inserted in the *Times* of the 16th inst., I would be glad if you would allow me to make a few observations. The matter is important inasmuch as the determination of what is to be done with the sewage entirely depends on its value.

Mr. Shepherd says: "It is a fact that 750 tons of the rich sewage of London can be delivered to a distance of 100 miles round London, and on every farm included in that area, at a less cost than the farmer is now paying for 1 ton of guano, while the 750 tons of sewage contains more fertilizing matter than 5 tons of guano."

If this were really the case our prospects for the utilization of sewage—as it is—by the farmers would be very hopeful indeed, but I am sorry to say it is far from the truth. According to Drs. Hoffman and Witt, whose report on the nature, properties, and value of sewage, is the latest and best (published in the blue-book on the main drainage), the value of 100 tons of London sewage is only 17s. 7d. or a fraction over 2d. per ton, so that it would require 1,700 tons of sewage to replace 1 ton of guano. It follows from this that instead of 750 tons of sewage containing more fertilizing matter than 5 tons of guano, it only contains matter equal to about 9 cwt. The question which next arises is, at what rate or price can 1,700 tons of London sewage be delivered to the farmer at say 10 or 20 miles distance so as to replace 1 ton of guano which costs him £15 per ton? Again, can the sewage be delivered to the farmers at less than 2d. per ton, at say 10, 15, or 20 miles from London? If so, for how much per ton can it be delivered? There are other very pertinent questions which might here be put, but I do not wish to take up too much of your space; and besides, it will be as well to obtain satisfactory answers to the above before proceeding further. It is necessary to repeat that this subject is very important, but the adoption of sewage as a manure must after all depend on its value as a fertilizer, and on what it can be delivered to the farmer for.

I remain, yours, &c.

C. F. O. GLASSFORD.

Greenwich, Nov. 22, 1859.

The Vicomte Marie de Botherel, who died the other day in very straitened circumstances at Dinan, formerly possessed a large fortune, but got rid of it all through his unquenchable love for commercial speculations. His chief folly was the building of an immense establishment, including 15 kitchens, and starting omnibus restaurants: 12 of these vehicles carried hot viands, and 12 cold, all over the city; while 24 more supplied all Paris—or would have done so—with wine and liqueurs. He lost all his fortune by this freak except 250,000 fr., and this he got rid of in a very short time as a wine merchant on a gigantic scale. He has left behind him a work, in 4 vols., on "Human Infirmities!"

NOTICES.

The *MECHANICS' MAGAZINE* will be sent free by post to all subscribers of £1 ls. 8d., annually, payable in advance. Post Office Orders to be made payable to R. A. Brooman, at the Post Office, Fleet Street, London, E.C.

THE APPEAL.

SINCE our last notice on this subject the following sums have from time to time been received, viz., T. R., £1; J. N., 10s.; J. T. 5s.; H. O., 2s. 6d.; H. B., 2s. 6d. For each and all of these we have to express the warm thanks of the receiver.

[ADVERTISEMENT.]

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."
Scottish Central Railway, Locomotive Department,
Perth, November 21, 1859.

DEAR SIR,—Will you oblige me by inserting in your two next numbers that I do not claim the Originality of the Throttle Valve in the Blast Pipes in Locomotive Engines, as a means of retarding railway trains, though patented by me: for, since I did so, I have found it previously patented by Mr. RUDOLPH BODMER, of London, to whom any merit is due in introducing it in this country.

I am, dear Sirs, yours truly,

ALEX. ALLAN.

Law Cases.

CURTAIN'S PATENT CARPETS.

COURT OF EXCHEQUER, NOV. 30. (*Sitting at Nisi Prius, at Westminster, before the Lord Chief Baron and a Special Jury.*)

CURTAIN v. CROSSLEY AND OTHERS.

Mr. Huddleston, Q.C., Mr. McNamara, and Mr. George Shaw were counsel for the plaintiff. Mr. Atherton, Q.C., Mr. Montague Smith, Q.C., Mr. Grove, Q.C., and Mr. Aston appeared for the defendants.

This was an action brought by the plaintiff, who is the patentee of certain improvements in the manufacture of carpets, for an infringement of his patent by the defendants, who are the well known carpet manufacturers at Halifax, in Yorkshire. The infringement complained of was the using by the defendants of a wire with a bladed end for cutting the pile of Brussels pile carpets in the course of their manufacture in the manner pointed out by the specification of the plaintiff's patent. It was shown that the old method of cutting the pile could not be applied to power looms, and there was no question as to the fact of the defendants having used the bladed wire. For the defence it was proved that wire constructed on the same principle as that used by the plaintiff had been used in the manufacture of pile carpets, velvet, and velvet lace anterior to the date of his patent. An extract was read from the *Dictionnaire des Arts*, published in Paris prior to the plaintiff's patent, and sold in London, describing the raising of the pile of Gobelins tapestry by a process similar to that employed by the plaintiff in his manufactures under his patent.

After Mr. Atherton had summed up his evidence, and Mr. Huddleston replied upon the whole case.

The Lord Chief Baron, in the course of his summing up, told the jury that if they believed the witnesses called for the defendants, they must find their verdict for them.

The Jury found a verdict for the defendants.

TUCK'S PATENT PISTON-PACKING.

COURT OF QUEEN'S BENCH, NOV. 30.—SECOND COURT. (*Before Mr. Justice Blackburn and a Special Jury.*)

The Court was occupied the whole day in the trial of "Tuck v. Silvers," for the infringement of a patent for packing the piston-box of steam engines.

Only six special jurors answered, and the remainder of the panel were fined 5s. each for non-attendance.

Mr. Bovill, Mr. Lush, Mr. Wilde, Mr. Webster, and Mr. Hindmarch appeared as counsel in the case.

Our Weekly Gossip.

AN American gentleman, Mr. Germain, of Buffalo, proposes to build a ship 4000 feet long, 73 feet broad, and having a long steadying fin 20 feet broad on each side of her. She is to be so sharp forward that she shall taper only 6 feet in 100. The fins are to be as deep as they are broad, and to taper off to nothing in the last 500 feet. The extreme end of the vessel is to be an upright wedge, with a sharp edge. Twenty-five feet of the aft end is jointed for a rudder. The fins moving continually in water, can be used for surface condensers, and having the air pumped out and the steam exhausting into a vacuum, the locomotive engine may be used with the advantages of a condensing engine. The bottom and side walls are double, with their outer and inner surfaces three feet apart, tied together once in three feet by iron walls, and braced diagonally with timbers. Each compartment is to be water tight. The decks are to be of iron. "Careful calculations show," he says, "that the greatest oceanic forces will not try the strength of the vessel in any way to exceed ten per cent. of its strength. A side wind of twenty three miles an hour will career it less than two inches, and a tornado of one hundred miles an hour, striking the whole side with a force of fifty pounds to each square inch of surface, would career the vessel only thirty-eight inches, or less than five degrees. If steel is used for its construction, it would give twenty-five acres of deck room. Compared with other vessels and their work, its expenses would be exceedingly moderate, and at the same time it might carry two hundred thousand horse-power. Its size, strength, and velocity would make it irresistible by ordinary vessels of war. Cannon shot would glance unharmed from its oblique sides; during its approach it would be directed with the precision of a rifle, and its blow would divide the largest line-of-battle ships as easily as a broad axe would an apple." Where is the Great Eastern now?

We do not remember to have said anything to provoke the following curious letter:—

London, Nov. 25, 1859.

GENTLEMEN,—It has been stated in a public company that you had in the MECHANICS' MAGAZINE alluded to my inventions or system of telegraphing on the ocean or land by means of colours during the night or by day and that my Lords of the Admiralty had paid me for them before using them on her Majesty's ships of war. Now, as this statement has been made by the trickery and deceit of those creatures who abound about the Admiralty connected with the press, I beg to state that no payment has ever been made to me directly nor indirectly for this invention, nor any compensation whatever; and so far from doing that they in the most dishonest way have taken the advantage of all my inventions, because I was poor and unable to defend myself in a court of law, and done everything to keep me from being paid. They have also invariably aided one pirate after another, some from England, France, and America, to come forward to use my inventions for telegraphing by colours, under other names, in order to evade paying me for an invention and code of signals so useful and complete that they have become now universal throughout the whole world, both by steam and sailing vessels on the ocean and on all railways by land; and because I would not submit to the insolence of office, and be bullied by a naval captain, and give a share of the money I was entitled to receive for them. Ever since 1846 I have been kept out of my just claims by my Lord John Russell's Lords of Admiralty! These signals and telegraphs were brought out on the banks of the Clyde by the late Earl of Haddington and Sir R. Peel's Government in 1843. The trials at Portsmouth will be found in the *Times* and press of the day, and in documents laid before the House of Commons. But when the Whigs came into power in 1845 they not only set their own creatures to carry out my plans and inventions, to the ruin of myself and family, though they knew I was promised by Sir R. Peel's Government pay and place to carry them out. Trusting you will insert and counteract any such false statement as to my being paid, which I have reason to expect from your well-known wish to protect inventors.

I am, Sir, yours obediently,

R. RETTIE, C.E.

The inventor of all the coloured signal telegraphs by sea or land for night and day now in use throughout the world.

The following suggests useful considerations, if it does no more:—

GENTLEMEN,—Although I highly appreciate the movement for promoting the object of educated female labour, I very much fear that in practice the good effected will fall far short of the present expectations of the benevolent promoters, and even of yourselves. There is at present a great amount of labour for females, but the competition and covetousness of manufacturers turns into a curse that which might be a blessing. Almost every department of present female labour was once well paid for, and those employed worked a reasonable number of hours, obtained good wages, and appeared, and were respectable. But their want of moral courage is taken advantage of by their rapacious employers, and their wages are curtailed until hard work is little better than starvation. Poor girls now work at india-rubber goods for a penny an hour! These low wages generally lower the morals, and bring other evils in their train. In the town of Locle, in Switzerland, females who work at the finest parts of watches earn five francs a-day. An equal remuneration in London would be about 10s. a-day. Now, what English manufacturer would think of paying a female 10s. a day, whatever the work? Instead of this I believe they will be ground down to a condition little better than the shirt-makers, their Swiss sisters will be injured, and then the cuckoo note will be repeated, "We want employment for females." T. MOY.

1 Cliffords Inn, Nov. 23, 1859.

The standards which the Treasury were required to provide by the third section of Lord Redesdale's "Act for regulating measures used in sales of gas," have been duly deposited, says the *Journal of Gas Lighting*, in the office of the Comptroller of the Exchequer, No. 6 Old Palace Yard, Westminster. "They comprise a weight of 62·321 lbs. avoirdupois; a bottle containing that weight of distilled water at a temperature of 62° Fahr., and a barometric pressure of 30 inches; and a king's cubic foot transferer. The whole have been prepared under the direction of and verified by the Astronomer Royal, assisted by Professor W. Miller, of Cambridge. The weight is of brass, and has been made by Mr. L. Oertling, the well-known balance-maker of Store-street, Bedford-square. The cubic foot bottle is a copper cylinder with conical ends terminating in tubes, the bottom one being closed by a cock, and the upper one being open. It has been manufactured by Messrs Ladd and Co., of the Old Jury, the hydrometer makers to the Excise; and the cubic foot transferer has been made by Messrs. Crossley and Co., of the Southwark Bridge Road. It does not appear to be considered necessary at present to prepare any standard multiples or decimals of the cubic foot measure, but gas companies and others can have the indices of their own testing gasholders adjusted to the Exchequer standard, or they can procure duplicates of the cubic foot transferer and adjust the indices themselves. They may, by adopting either of these courses, ascertain at once what metres do and what do not comply with the tests prescribed by the Act, and thus mitigate to some extent the inconveniences to which the further delay in the appointment of inspectors under the Act is now subjecting them."

A correspondent desires to offer the following suggestion and observations:—

Clifton Cottage, Montague-road, Uxbridge,
November 24, 1859.

GENTLEMEN,—The observations of two correspondents in your last number upon ships' chain cables have suggested to me the desirability for some elastic medium between the straining points of the cable. Of its practicability I do not pretend to judge—whether it would be feasible to pass the cable over or round a suspended pulley of proper dimensions. The bottom pulley being of solid iron, and sufficient weight to overcome the average strain, yielding only to a sudden or heavy one, that would be dangerous to the integrity of the cable. Perhaps the mention of the subject might bring forward a practical plan. I have also seen a paragraph in last week's *Builder*, describing an improved propeller upon the principle of a duck's motion in the water, which corresponds exactly with one I have been endeavouring to mature so as to allow of several fans working at the same time, which would be necessary to obtain an even motion for the vessel; these might be arranged either along the keel, at the bows, or the stern, vertically or horizontally, and would doubtless with proper fans obtain a good hold off, and exert great power in the water.

I am, Gentlemen, your very obedient servant,

W. A. BENDELOW.

The screw steamer City of Baltimore, on her last voyage from New York, encountered the full force of the late storm without any material injury.

Patents for Inventions.

ABRIDGED SPECIFICATIONS OF PATENTS

THE abridged Specifications of Patents given below are classified, according to the subjects to which the respective inventions refer, in the following table. By the system of classification adopted, the numerical and chronological order of the specification is preserved, and combined with all the advantages of a division into classes. It should be understood that these abridgements are prepared exclusively for this Magazine from official copies supplied by the Government, and are therefore the property of the proprietors of this Magazine. Other papers are hereby warned not to produce them without acknowledgment:—

STEAM ENGINES, &c., 1047.

BOILERS AND THEIR FURNACES, &c., 1042, 1049.

ROADS AND VEHICLES, including railway plant and carriages, saddlery and harness, &c., 1018, 1034, 1046.

SHIPS AND BOATS, including their fittings, 1020, 1023, 1037.

CULTIVATION OF THE SOIL, including agricultural and horticultural implements and machines, 1027, 1041.

FOOD AND BEVERAGES, including apparatus for preparing food for men and animals. *None.*

FIBROUS FABRICS, including machinery for treating fibres, pulp, paper, &c., 1008, 1024, 1028, 1031, 1032, 1038, 1050.

BUILDINGS AND BUILDING MATERIALS, including sewers, drain-pipes, brick and tile machines, &c., *None.*

LIGHTING, HEATING, AND VENTILATING, 1009, 1021, 1032.

FURNITURE AND APPAREL, including household utensils, time-keepers, jewellery, musical instruments, &c., 1007, 1013, 1014, 1015, 1019, 1035, 1043.

METALS, including apparatus for their manufacture. *None.*

CHEMISTRY AND PHOTOGRAPHY, 1045.

ELECTRICAL APPARATUS. *None.*

WARFARE. *None.*

LETTER PRESS PRINTING, &c., *None.*

MISCELLANEOUS, 1010, 1011, 1012, 1016, 1017, 1019, 1020, 1022, 1025, 1026, 1027, 1030, 1033, 1038, 1039, 1040, 1048.

1007. E. LEWTHWAITE and G. AMBER. "Improvements in clocks, watches, chronometers, and other timekeepers." Dated April 21, 1859.

This relates, 1, to the escapement, and consists in dispensing with the pallet-wheel now used, and substituting in lieu thereof a piece which is called a propeller, which may be either of metal or stone, formed with one or more very short arms, pins, or radii, which act upon the pallet as a dead beat or otherwise. By this improvement the patentees avoid to a great extent the variation in time caused by the change of temperature expanding and contracting the pallet-wheel. It relates, 2, to the fusee, and consists in having the driver or first motion wheel formed with inverted cogs or teeth in addition to the cogs or teeth now thereon, such said wheel to be loose upon the axis or spindle of the fusee, and gearing with a small pinion working on a stud attached to the fusee, which gears with another pinion fixed on the axis or spindle of the fusee. By the above means power or continuous action is maintained whilst winding up the timekeeper. *Patent completed.*

1008. E. CLARK. "Improvements in sewing machinery." (A communication.) Dated April 21, 1859.

This consists, 1, in a method of securing two or more needles in the needle carrier. 2. In sewing compound seams by the use in combination with two or more needles, of one or more tongues of metal attached to the bed of the machine, and one for each space between every two needles. Also in combining with the said tongue or tongues a concave bed piece, the object of the bed piece being to give support to the cloth on both sides. 3. In uniting compound seams, by combining with two or more eye pointed needles a vibrating thread carrier. 4. In guiding the cloth to the needle in forming seams when one or both pieces of cloth is or are lapped or folded over to make a flat seam by the use of two guide plates suitably arranged. 5. In guiding the cloth to the needle in sewing hems by attaching the tube guide for holding the hem to the bar of the presser foot by a yielding arm having sufficient space between the upper surface of the presser and the hem guide for the passage of the cloth. 6. In operating the instrument which feeds in the cloth by a single lever. *Patent completed.*

1009. G. ROBERTS and J. BRIDGES. "Improvements in the manufacture of candles." Dated April 21, 1859.

Here the wick is first dipped into the hollow to obtain a certain substance, and after getting cool is then dipped into a composition of tallow, resin, and pitch, or resin and tallow, or pitch and tallow, in the proportion of about eight parts of tallow to two or more parts of the other material. When cool, it is again dipped into the tallow, and giving layer for layer as required, until the size is obtained, in variably keeping a layer of tallow on the outside surface. *Patent completed.*

dies can be burnt with plaited or common wicks. *Patent completed.*

1010. T. S. TRUSS. "Improvements in the construction of pipes, and in the mode of joining the same." Dated April 21, 1859.

The patentee claims the making of an expansive or contractile joint by which pipes for the transmission of gas, water, steam, or other fluid are to be secured together by means of a compressing or nut-coupling strap, in two or more parts, with packing material upon, between, or around the ends of the pipes embraced by the strap. Also, the making of the junctions of coupling straps with recesses and corresponding projections or loose blocks. Also, the making of pipes with flanges at or adjoining their ends to be used with, or operated upon by a compressing or nut-coupling strap with packing material upon, between, or around the same, and embraced by the strap. *Patent completed.*

1011. J. H. PEPPER. "Improvements in apparatus for showing stereoscopic pictures." Dated April 21, 1859.

This consists in so combining apparatus that the two stereoscopic pictures shall be thrown side by side on to a screen or surface by lanterns having suitable lenses, so that when seen by several persons through different lenses (having focal powers according to their several distances from the screen or surface) each person shall see the two projected pictures as one largely magnified stereoscopic picture. *Patent abandoned.*

1012. H. KEACH and G. H. FARRINGTON. "Improved advertising circulars." Dated April 23, 1859.

Here, a sheet of card, paper, or other material, being folded in one or more folds, covering each other, or in the manner of a tailor's pattern book, the inventors draw or print on each side of the various folds subjects or pictures, which may be embossed or not. They then cut out or perforate by dies, stamps, or otherwise pieces of the folds in different shapes and sizes, which admitting some portion of the underfold to sight, produces a scenic effect, developing a different scene or picture as each flap is unfolded. *Patent abandoned.*

1013. R. GRAY. "Improvements in crinoline skirts." (A communication.) Dated April 23, 1859.

The inventor proposes to attach the hoops to the cords or tapes by metallic clasps or fastenings. *Patent abandoned.*

1014. C. MANSSEL. "A folding travelling case." Dated April 23, 1859.

This consists of a strip or longitudinal wrapper of oilskin, leather, &c., provided with a transverse arrangement of pockets or envelopes, of forms suitable for the reception of articles, together with bands of elastic material secured to the wrapper so as to retain the smaller articles in their places upon the folding of the case, to which also an extensible action is given for rendering the case adjustable to the contents or variable capacity of the same, straps or buckles being used for securing the case when folded. *Patent completed.*

1015. J. EDWARDS. "Improvements in the manufacture of buttons." Dated April 23, 1859.

This relates to an improved method of forming the holes in "sewn through" buttons. A hollow well is formed in the centre of the button leaving a projection or other stop round the button on the inside; into this hollow well a bar of iron is inserted and forced down to the bottom, thereby forming the holes by which the button is sewn on to the garment. *Patent abandoned.*

1016. J. ARMSTRONG. "Improvements in drying and preserving timber." Dated April 23, 1859.

The timber to be dried and preserved is placed in a suitable chamber, and is subjected to the direct and immediate action of steam, which both dries the timber and opens its pores for the reception of the creosote or other preservative. *Patent abandoned.*

1017. J. GILLIES. "Improvements in branding or marking wood for casks, barrels, and other purposes." Dated April 23, 1859.

The apparatus here used consists of an open cast iron frame, on the platform or table of which is placed an open-topped elliptical case of cast iron, perforated all round for the admission of air, and for the escape of the products of combustion. Within this case there are one or more vertical gas burners, adjustable as to height. Each burner consists of an inner cylindrical shell closed at the top, and perforated all round the lower part for the escape of the gas. This inner cylinder is surrounded by an outer and larger cylinder, also perforated, the flame rising up between the two cylinders. The flame plays directly upon the lower plain surface of the branding die plate of metal, the upper working face of which is cut or cast with the necessary names or devices in relief. The platform framing also carries a bracket pillar piece, the over-

hanging eye of which has a large nut in it for the reception of a vertical screw spindle terminating at its lower end in a horizontal pressure plate. The top of the screw spindle has a horizontal wheel or weighted arm upon it, so that the arrangement resembles that adopted in fly or punching presses. Each piece of wood to be branded is laid flat down upon the operating face of the branding die-plate on the open top of the gas-burner box, and the attendant then screws down the pressure plate by turning the wheel or actuating over-head arm. In this way the wood is pressed hard down upon the heated branding plate, the pressure being kept up for a longer or shorter time. *Patent completed.*

1018. J. ANGUS. "Improvements in saddles." Dated April 23, 1859.

This relates more particularly to those saddles employed for carting purposes. In cart saddles the trough of the saddle-tree is composed of four pieces of metal, the bottom of the trough being made up of two pieces of wrought iron, forming a but point at the centre or crown of the arch. These two bottom pieces of metal are riveted to the convex side of an under piece of wood correspondingly curved, and they are so rolled or shaped as to be thinned off at the contiguous junction ends whilst they increase in thickness to the usual external end plate pieces for the play of the chain or back band. The sides of the trough are formed of two parallel flanged or vertical edge pieces which are riveted through the main wood bottom by transverse rivets from side to side. The upper edges of these two side or flange pieces are turned over with a moulding or head cover, and the forward flange is thickened at each end on the inner side to resist the forward frictional pressure of the chain or back band on going down hill or backing. There are modifications included. *Patent completed.*

1019. W. DICKS and W. HOPWELL. "Improvements in machinery for making screws and applying them in fixing the soles of boots and shoes." Dated April 23, 1859.

Here the wire or metal rod is fed into the machine through a tube which receives rotating motion from the main or shaft of the machine by the aid of a suitable train of wheels interposed between the main or driving shaft and the tube, provision being made for changing the speed of the tube, and consequently the length of screw produced by means of change-wheels. The main or driving shaft is put in motion by a treadle, or by hand, or by other power. The wire as it leaves the tube passes between two rollers placed at the front of the tube, and such rollers hold the wire securely. The forward end of the wire is at all times between a pair of screw dies or cutters fixed or held in front of rollers, so that as the wire is caused to rotate a screw will be cut thereon, and the end will be caused to protrude more and more through and beyond the dies or cutters. In order that the act of making or cutting a screw or the wire may be the cause of its entering into the sole of a boot or shoe, there is a proper table or platform used, on the boot or shoe is held up to the die or cutter in such manner that the screw as it protrudes beyond the dies or cutters is caused to enter into the sole. When the proper length of screw has been cut, and has entered the sole, it is cut off by a suitable cutter, which cuts the screw flush with the outer surface of the sole. In order that the motion of the tube and rollers may be stayed whilst the cut is being effected, and the sole moved a distance equal to that between the neighbouring screws in the sole, provision is made to stop the formation of the screw for a time by means of a cam and interposed mechanism whilst the cut is being made, and so soon as the cut has been made and the sole is again in a proper position to receive another screw, the gearing communicating to the tube and apparatus holding the wire, are brought into action till the proper length of screw has been again made and screwed into the sole, and another cut by the cutting apparatus is required to be performed. *Patent completed.*

1020. P. L. M. DEBAIN. "Improved means for transmitting motive power to ships' pumps, and other arrangements by which the displacement of fluids is effectuated." Dated April 23, 1859.

This consists in providing a vessel in the form of a hollow sphere, in the interior of which is situated a diaphragm formed of any suitable elastic material, which diaphragm receives on one of its surfaces the impetus of steam, vapour, or other motive power, and by its opposite surface transmits this impetus to the water or other liquid to be acted upon, and which latter at the required moment, and by means of proper valves, cocks, &c., is permitted to come in a proper situation for being acted upon by one of the surfaces of the diaphragm, whereas the action of the steam or other prime motor on the opposite surface of the

diaphragm is also regulated by any suitable means. *Patent abandoned.*

1021. P. F. MUEL and L. H. BLANCHARD. "Improvements in gas burners." Dated April 23, 1859.

The inventors introduce and fix on argand burners a plate, and in this plate at the required distances apart small tubes of iron, or any other suitable metal or material, and of the required diameter and length, according to the size of the burner, through which tubes the gas issues from the burner. *Patent abandoned.*

1022. P. L. M. DEBAIN. "Improvements in making heat subservient for producing motive power." Dated April 23, 1859.

This consists in arrangements by which the heat obtained by causing compressed air to be injected, and burned on a burner, or fire-place situate in the interior of a suitable vessel, serves for evolving steam or other elastic vapour from water, or other suitable liquid or solution contained in a boiler in which this burned air is allowed to enter, by which arrangement consequently the evolution of steam or vapour, and the concentration of the solution or liquid, are obtained simultaneously, while the steam or vapour is further caused to act on the elastic diaphragm, with which is provided a motive power transmitting vessel. *Patent abandoned.*

1023. W. GIBSON. "Improvements in steering apparatus." Dated April 23, 1859.

This invention was described and illustrated at page 24, No. 23, vol. 2, of the MECHANICS' MAGAZINE (New Series). *Patent completed.*

1024. R. A. BROOMAN. "An improvement in the manufacture of woollen cloth." (A communication.) Dated April 23, 1859.

This consists in incorporating woollen waste, or the shearings produced in the shearing mill, with cloth, after the same has been woven, and during the fulling thereof. The fulling bath may be composed of a mixture of soap and water, and of woollen shearings, and while being filled the cloth becomes furnished with the woollen particles. *Patent completed.*

1025. J. MARSHALL, jun. "Improvements in filtering and depurating fluids." Dated April 23, 1859.

This invention is not described in detail apart from the drawings. *Patent completed.*

1026. W. MOXON, and J. J. BENNETT. "Improved apparatus for raising or lifting and lowering heavy bodies." Dated April 23, 1859.

This consists in so arranging the apparatus employed for effecting the above operations, that two or more weights may be simultaneously lifted by the same motive agent. The invention is not fully described apart from the drawings. *Patent completed.*

1027. F. C. MAGUIRE. "Certain improvements in the utilization of sewage manure." Dated April 23, 1859.

This consists in raising by steam or other power sewage to reservoirs of sufficient height and space for the operations of machinery, to allow such sewage to traverse the various lines of railway or roading in, through, or along stone, earthenware, or such other pipes or channels as may be most convenient and economical for the purposes required, with inclosed receptacles at the various railway stations throughout the three kingdoms or depôts on the various roadways to allow of it being carried away from such stations or depôts in manure distributors, or taken in pipes to any farm, homestead, hamlet, village, or town laid within the three kingdoms for the purposes of irrigation and fructification. *Patent abandoned.*

1028. W. STEVENSON. "Improvements in spinning, doubling, and manufacturing cotton, and other fibrous materials." Dated April 25, 1859.

This consists in so arranging throstle spinning frames that the present indirect drag upon the bobbins may be done away with, the winding-on action being effected by a special movement for the purpose. *Patent completed.*

1029. W. P. BALFERN and M. MCKAY. "The manufacture of sweet-ligged soft soap." Dated April 25, 1859.

For the manufacture of this kind of soap the inventors first prepare caustic leys by mixing 100 parts of American potash with 80 parts of lime and a sufficiency of water, and boiling the same until it becomes completely caustic. They then pour into the soap from 200 parts of the prepared leys, at 18° Beame, and bring it to the boiling point, when they add 14 parts of tallow. This being dissolved and the liquor boiled for 15 minutes, they add 14 parts of oleine obtained from palm oil, in the manufacture of candles or otherwise. After a further boiling of 15 minutes they add 25 parts more of oleine, and so continue to add and boil until 100 parts of oleine have been incorporated and saponified. *Patent abandoned.*

1030. J. HIGGIN. "Improvements in treating

madder and plants of the same family, and preparations therefrom." Dated April 26, 1859.

The patentee claims, 1, the subjecting madder or a preparation of it to a prolonged contact with acid at the ordinary temperature of the air previous to washing. 2. The drying a mixture of madder, or a preparation of it and acid, subsequently washing out the acid. 3. The use of corrosive metallic salts, as described in detail in the specification. 4. The manufacture of an extract of madder from the rubian contained therein in the manner described in the specification in detail. *Patent completed.*

1031. G. WARD. "Improvements in machinery or apparatus for making healds." Dated April 25, 1859.

This relates to certain improvements in Berrie and Anderson's machinery for making healds or heddles used in weaving, and consists of an improved taking-up motion worked by toothed gearing, instead of worms and worm wheels; of an arrangement of guide and stretching pulleys for enabling the entire length of the heald to be formed without winding or tapping any part on a drum; of the employment of a carrier wheel for giving motion to the pinions which turn the bobbins containing the braid bands or tie threads and also the revolving lappers; a mode of working the pusher for pushing off the eyes of the heald as they are formed, and of an arrangement for working the sliding bolts or frame for working the braiding needles. *Patent completed.*

1032. J. OWEN and H. DUCKWORTH. "Improvements in machinery or apparatus for leasing yarns." Dated April 25, 1859.

For sizing warps the inventors place in a position beyond the rest-beam or bar of any suitable shape, with indentations cut in it of different dents or counts according to the counts or qualities of yarn to be operated upon, and at each side of the said bar they place a comb with incisions of about $\frac{1}{2}$ of an inch in depth, so that at the time of casing one of the said combs will ascend and the other descend, thus causing one-half of the yarn threads to rise and the other to fall, by which the lease is made. They also use a brush to straighten the threads when necessary in taking the lease. *Patent abandoned.*

1033. T. A. WESTON. "A new or improved pulley." Dated April 25, 1859.

Here an endless chain is so applied to an axle of two different diameters in the two parts to which the chain is applied, or to two pulleys of different diameters, that two depending loops are formed by the said endless chain, each of the said loops hanging from one side of one part of the axle or from one pulley. When pulleys are used they are made to rotate together by being fixed together, or fixed to the same axle, the axle in this case rotating with the pulleys. *Patent completed.*

1034. T. BUCKHAM. "An improvement in railway switches." Dated April 25, 1859.

This consists in connecting the moveable switch rail to the fixed rail by a hinge-joint "fished" to each side of the ends of the switch rail and head rail. One of the hinge-joints acts as the centre on which the switch rail moves, whilst the other has the hole in which the pin fits, made oval, or slotted about one-eighth of an inch in the direction in which the rail moves, to allow of the required movement of the switch rail. *Patent abandoned.*

1035. J. HOLMES. "Improvements in applying eyelet holes to boots and shoes, and in binding boots and shoes." Dated April 25, 1859.

Here metal eyelet holes are employed in fastening the material used for binding boots and shoes at those parts where laces are used, so that the same eyelet holes serve to attach the binding and also for the passage of the laces. *Patent completed.*

1036. A. W. GADESSEN. "Improvements in producing solutions of sugar." Dated April 25, 1859.

The patentee employs a vessel having a hemispherical bottom to which heat may be applied either by an internal coil of steam pipes, by a steam jacket, or other means; across the lower part of this vessel is a perforated false bottom or partition on which the sugar is placed. Connected with this vessel is a cylinder of which the lower end descends below and the upper end rises above the perforated partition or false bottom. In the cylinder a screw or suitable propeller is applied, by which the water or liquor is constantly raised from the under to the upper side of the partition or false bottom, and is thrown on to the sugar to be dissolved. *Patent completed.*

1037. E. HUMPHREYS. "Improvements in steering apparatus." Dated April 25, 1859.

Here a cylinder is used in which a piston is moved to and fro by the pressure of water. The rod of this piston is connected to an arm on the rudder-post. *Patent completed.*

1038. W. E. NEWTON. "Improvements in sewing

machines." (A communication.) Dated April 25, 1859.

This invention is not described in detail apart from the drawings. *Patent completed.*

1039. H. C. HURRY. "Improved means of and apparatus for obtaining motive power." Dated April 25, 1859.

The chief object here is to obtain an effective motive power by the combined forces of attraction and repulsion between a large number of magnets, whether electro or other, with constant poles and other electro-magnets whose poles are varied, such large number of small electro-magnets being made to act with considerable rapidity instead of a small number of large magnets acting more slowly. *Patent completed.*

1040. W. WARNE, J. A. FANSHAWE, J. A. JACQUES, and T. GALPIN. "Improved compounds applicable for packing the joints of steam or other pipes, which compounds are also applicable for packing or lining parts of machinery in general, or parts of ships, bridges, tanks, or railways." Dated April 25, 1859.

In manufacturing their compounds the patentees employ caoutchouc, gutta-percha, bituminous, resinous, or gelatinous substances, metal filings, pulverised ores of metals, or oxide of iron or manganese. Sal-ammoniac and other suitable chemical agents may be added. *Patent completed.*

1041. S. L. TAYLOR. "Improvements in agricultural implements, in obtaining motive power for actuating such implements, and in apparatus connected with the application of steam power." Dated April 25, 1859.

This consists, 1, in arranging single or double-breasted ploughs on a shaft or axis with the one of a pair or half the number of a series arranged above the axis, and so that the one will plough in the one direction, and the other in the opposite direction. 2. In placing the jointed parers which are attached to the sole of the plough on bolts or joints, on which they can move, so as to be set wider or narrower. 3. In arranging scarifiers, rakes, &c., on an axis which has a locking plate and a spring catch applied, which when let go allows the instrument to rotate on the axis, and thus releases any matter that may clog their working. 4. It relates to implements dragged by horses, and consists in mounting and fitting the drag frame in the forewheels and carriages, so that it has an oscillating motion in two directions, the one at right angles to the other. The invention also relates to engines for actuating agricultural implements, and comprises a variety of detail which we cannot particularise. *Patent abandoned.*

1042. T. HOLT and J. BROWN. "Improvements in apparatus or an improved apparatus for heating water for the supply of steam-boilers, which improvements or apparatus are also applicable in some cases for the prevention of incrustation in steam-boilers." Dated April 25, 1859.

This consists in a mode of rendering available for the heretofore wasted heat, that is to say, in the use, adaptation, and application of a vessel, tank, or cistern placed in juxtaposition with that end of the boiler which is remote from the furnace, in such a position as to be impinged upon by the flame vapour and heated products of combustion proceeding from the furnace, and issuing from the said end of the boiler through the mouth or opening of the first flue (or flues), and the said tank serving as a reservoir through which the feed water before entering the boiler is made to pass, and to have its temperature raised by the heat derived from the vapour or flame intercepted by the said tank, or passing in contact therewith. *Patent completed.*

1043. H. ALLMAN. "Certain improvements in the construction of window-blind mountings, and in apparatus connected therewith." Dated April 25, 1859.

This invention is not described apart from the drawings. *Patent completed.*

1044. W. MACKENZIE. "An improved method of printing impressions upon an enlarged scale, either from engraved plates, electrotypes, blocks, drawings, or other surfaces." Dated April 25, 1859.

The patentee claims the making of electrotypes, &c., upon an enlarged or reduced scale for printing or other purposes when such electrotypes shall have been made by the use of any elastic material transferred and prepared as described to give the necessary depth and arrangement of parts to produce the electrotypes, block, die, or other printing surface. Also the making of moulds and stereotype plates in place of electrotypes when such have been increased or diminished by the elastic properties of vulcanised india-rubber or other elastic substance. *Patent completed.*

1045. W. E. NEWTON. "Improvements in the manufacture of nitric acid and its application for the production of artificial nitrous or nitric salts." (A communication.) Dated April 25, 1859.

This relates, 1, to the production of nitric acid or its salt by the decomposition of atmospheric air by means of dynamic and static electricity. 2. The subsequent absorption of the nitric acid thereby produced by water so as to form commercial nitric acid, or by its combination with suitable alkaline bases to form nitrous or nitric salts. *Patent completed.*

1046. R. MAIN. "Improvements in wheels for carriages." Dated April 25, 1859.

According to this invention there is a hollow space formed in the felloe of the wheel, in which is inserted a series of segmental links connected together by pins, and forming together a kind of chain all round the wheel. The inner side of this chain rests against springs fixed in the inner part of the felloe, and the outer part of the chain is thus made to project beyond the tyre and form a projecting ring or flange on the circumference of the wheel, so as to be capable of holding and guiding the wheel on a tram or rail. By this construction of the wheel, also, the weight of the carriage will be caused to press the flange inwards against the springs; so as to admit of the wheels running on ordinary ground. It also consists in the construction of wheels intended to run on ordinary ground with elastic projections on their circumference. For this purpose a hollow space is formed in the felloe of the wheel in which springs are inserted, and projecting pieces are inserted through spaces in the tyre at intervals so as to rest against the springs. Thus the projections around its circumference will yield to the unequal pressure of the ground. *Patent completed.*

1047. W. MARSHALL. "Improvements in steam engines." Dated April 25, 1859.

This refers to a previous patent dated 19th Nov., 1858, and consists in placing the high pressure, or smaller cylinder, inside the low pressure or larger cylinder. These engines, as adapted for a screw steamer, consist in each case of a pair of large inverted low pressure steam cylinders supported upon suitable framing upon a bottom sole plate. *Patent abandoned.*

1048. E. A. BROOMAN. "Improvements in vulcanising and colouring caoutchouc, and in the preparation of caoutchouc paints, and colours." (A communication.) Dated April 25, 1859.

This consists, 1, in vulcanising caoutchouc by passing it successively through baths formed, first, of benzine, cromate of sulphur, and red or black sulphuret of mercury, and, next, of chloride of lime and water. 2. In preparing a colouring for caoutchouc by first dissolving a portion of caoutchouc in benzine, turpentine, olive oil, or other solvent, and in adding thereto suitable colouring matter, in certain proportions, according to the colour required to be provided. *Patent completed.*

1049. E. A. BROOMAN. "Improvements in steam boilers." (A communication.) Dated April 25, 1859.

This consists in protecting the body of steam boilers from the direct action of fire by a protecting chamber placed behind the bottom of the boiler and the furnace, through which chamber the feed water is made to pass before entering the boiler. *Patent abandoned.*

1050. J. H. JOHNSON. "Improvements in machinery or apparatus for combing wool and other fibrous substances." (A communication.) Dated April 25, 1859.

The objects here are the keeping the fibrous substance itself, whilst undergoing the process of combing, in direct contact with a heated surface, and also the avoiding the circuitous path in which the fibrous material in all other combing machines is made to travel. *Patent completed.*

PROVISIONAL PROTECTIONS.

Dated Aug. 12, 1859.

1861. L. A. POSSOZ. Improvements in the manufacture and baking of sugars.

Dated Oct. 15, 1859.

2359. R. Smith. The purification of water and other fluids.

Dated Oct. 25, 1859.

2435. G. Canouil. New machinery for priming percussion caps without danger of explosion, also a new fulminate not hitherto employed.

Dated Nov. 2, 1859.

2404. B. Browne. A self-heating ironing apparatus. (A communication.)

2406. R. H. HOSS. Improvements in gas burners.

Dated Nov. 3, 1859.

2408. J. Leeming and J. C. Ramsden. Improvements in looms for weaving.

2502. W. Wilson. Improvements in machinery for the manufacture of felted fabrics, suitable for the bodies of hats, caps, and bonnets.

2504. J. Howard. Improved machinery for

moulding hollow bricks and tubular articles. (A communication.)

Dated Nov. 4, 1859.

2506. A. Binckes. Improvements in optical instruments.

2508. G. N. Buller. An improved mode or method of ornamenting articles composed wholly or partially of jet.

2510. J. A. Maxwell. Improvements in hydraulic engines to act either alone or in combination with steam and steam engines.

2512. F. H. Holmes. Improvements in apparatus for transmitting light.

2514. A. V. Newton. Improvements in type-setting and distributing apparatus. (A communication.)

2516. W. Hill. Improvements in lightning conductors.

2518. J. Chesterman. New and improved methods of and furnace for heating, hardening, and tempering clock springs, watch springs, band saws, steel for dresses, such as crinoline steel, and other like purposes.

Dated Nov. 5, 1859.

2520. C. Mackenzie. Improvements in machinery or apparatus for cutting and dressing staves for casks, barrels, and other wooden vessels.

2522. F. Fiehler and H. J. Wigley. The arrangement and construction of wheeled carriages or other vehicles or machines, in such manner that the occupant or occupants thereof may propel the same by alternating the weight of the person or persons riding.

2524. G. T. Bousfield. Improvements in machinery for grinding and polishing sheets of plate and other glass. (A communication.)

2526. W. Maunix. Improvements in the manufacture of manure.

Dated Nov. 7, 1859.

2528. A. L. Dowie. Improvements in effecting communications or signalling between distant or distinct parts of railway trains.

2530. G. Paey. A rein handle and holder applicable for riding or driving, either for single, double, or team reins.

2532. H. Barker. An improvement in clay, meerschau, and other pipes.

2536. A. Templeton and J. Lawson. Improvements in the manufacture of chenille or like fabrics suitable to be used in woven and other ornamental piled fabrics.

Dated Nov. 8, 1859.

2540. J. Thomson. Improvements in the manufacture or production of Brussels and velvet pile carpet fabrics and hearth rugs.

2542. J. H. Johnson. Improvements in watches or time keepers. (A communication.)

2544. T. S. Bottom. Improvements in the manufacture of chenille.

Dated Nov. 9, 1859.

2546. J. Hamer. An improved material for insulating the wires of electric telegraphs, for lining articles of dress, for covering, clothing, casing, or lining steam boilers, pipes, cylinders, and other vessels, conduits, or chambers, and for other similar purposes, to which the said material is or may be applicable as a non-conductor, for preventing or diminishing the transmission of heat or of the electric fluid.

2548. D. Fulton. Improvements in cylinders or rollers for printing and other purposes.

2550. G. Spill and D. Spill. An improvement in the manufacture of bands for driving machinery, and for various other purposes.

2552. W. Clark. Improvements in the construction and application of electric telegraph wires or conductors. (A communication.)

Dated Nov. 10, 1859.

2554. J. Edwards and J. S. Wright. Improvements in the manufacture of buttons.

2556. J. Tenwick. Improvements in the construction of street gutters.

2558. W. Fletcher. Improvements in machinery for making looped fabrics.

Dated Nov. 11, 1859.

2562. F. D. Jones. A weaver's loom with combs opened at the summit, and with moveable floating chains. (A communication.)

2563. T. Blinkhorn. Improvements in pumps.

2564. R. A. Brooman. The preparation of a salt, and means of combining, mixing, or applying the same to render fabrics, pulp, wool, oil, and other substances unflammable. (A communication.)

2565. R. A. Brooman. An improved method of preparing plates and cylinders for printing from. (A communication.)

2566. A. Jaquelain. Improvements in the manufacture of carbon and in apparatus employed therein.

Dated Nov. 12, 1859.

2567. R. Lansdale. Improvements in machinery or apparatus for washing and cleansing fabrics, which improvements are also applicable to churning.

2569. W. Burgess. An improvement in mowing and reaping machines.

2570. J. Scott. An improvement in anchors.

2570. A. Vickers. A method of opening and shutting two or four gates or doors simultaneously, and for fastening the same when either open or shut, applicable to railway crossings and other purposes.

2571. C. Norrington. Improvements in the protection of ships or vessels, forts, or batteries, from cannon shot, shell, or any other projectile.

2573. E. A. Burgess-Burgess. Improvements in the preparation of anchovies.

Dated Nov. 14, 1859.

2575. P. Graham. Improvements in machinery or apparatus for cutting wood.

2576. A. Applegath. Improvements in surface block printing.

2577. J. Madin. Improvements in furnaces and appliances connected therewith, for hardening and tempering crinoline or sheet steel, and incensing the same.

2578. J. Walworth and R. Harrowby. Improvements in smut machines or corn screens.

2579. J. and G. Goldberg. Certain improvements in the construction of purses or "porte-monnaies," and in an improved lock or fastening applicable to purses, bags, or other similar receptacles.

2580. A. R. Arrott. Improvements in the manufacture of carbonate of soda.

2581. C. H. Brooks. Improvements in apparatuses for paying out and hauling in telegraph cables.

2582. J. Holgate and J. Henderson. Improvements in locomotive engines, partly applicable to other steam-engines.

Dated Nov. 15, 1859.

2585. W. H. Ward. An improved turn-table for railways and other purposes.

2586. E. Borase. Improved apparatus for separating metals and metallic ores, when mingled with other substances in the state of slime.

2587. J. Donald and P. Smith. Improvements in apparatus for raising and for extracting liquids.

2588. C. Chalmers. Improvements in gas stoves, for heating buildings, apartments, and other similar places.

2589. W. Elliott. An improved method of raising water and other liquids.

2590. C. P. Alvey. Improved machinery or apparatus for the manufacture of envelopes.

2591. W. H. Ward. Improvements in tanning hides and skins.

2592. W. Wilkins. "A ridge trawler," or apparatus which may be employed on the ridges of buildings to support persons and plank.

2593. A. V. Newton. An improvement in the manufacture of hose or flexible pipe. (A communication.)

2594. T. D. Perkin. Improvements in the manufacture of colouring matters. (A communication.)

2595. J. Graham. Improvements in treating and applying products obtained when galvanizing iron.

PATENT APPLIED FOR WITH COMPLETE SPECIFICATION.

2614. J. Willcock. Improvements in the construction and arrangement of the boiler and working parts of steam fire-engines, parts of which are applicable to engines for other purposes. (A communication.) Dated Nov. 19, 1859.

NOTICES OF INTENTION TO PROCEED WITH PATENTS.

(From the London Gazette, Nov. 23, 1859.)

1393. W. E. Newton. Batteries. (A communication.)

1711. J. Todd, jun. Dressing seeds.

1714. C. and J. B. Tapp. Boilers and furnaces.

1775. J. Mollady. Hat.

1800. E. J. Cordner. Saving life from shipwreck.

1857. J. T. Pitman. Lubricating. (A communication.)

1858. W. Bouch. Breaks, buffers, and couplings.

1864. A. V. Newton. Carriages. (A communication.)

1935. D. and J. Russell. Docking ships.

1999. J. Bernard. Boots and shoes.

2062. W. H. Gedze. Nails. (A communication.)

2132. A. Lamb. Heating feed water.

2245. R. Breasley, jun. Raising the nap of cloths.

2344. W. Prosser. Production of light.

2358. N. Montanari. Aiding children in walking.

2360. J. Bernard. Boots and shoes.

2368. J. T. Pitman. Malleable iron. (A communication.)

2424. A. L. Dowie. Gas burners.

2450. J. Armour. Measuring and regulating supplies.

2487. L. Pohl. Fastenings.

2498. J. Leeming and J. C. Ramsden. Looms.

2528. A. L. Dowie. Signalling between parts of trains.

2536. A. Templeton and J. Lawson. Chenille.

2540. J. Thomson. Carpet fabrics.

2550. G. and D. Spill. Bands for driving machinery, &c.

The full titles of the patents in the above list can be ascertained by referring back to their numbers in the list of provisional protections previously published.

Opposition can be entered to the granting of a patent to any of the parties in the above list who have given notice of their intention to proceed, within twenty-one days from the date of the *Gazette* in which the notice appears, by leaving at the Commissioners' office particulars in writing of the objection to the application.

LIST OF SEALED PATENTS.

Sealed Nov. 23, 1859.

924. W. A. Martin and J. Purdie.

1237. J. Harmer.

1280. R. A. Gidds.

1291. A. Prince.

1311. W. Weild.

1313. P. Aitchison and T. Rinks.

1315. H. N. Nissen.

1321. R. A. Brooman.

1324. M. Davis.

1329. W. Gossage.

Sealed Nov. 23, 1859.

1325. A. Smith.

1326. W. Grimshaw.

1330. J. Fry.

1333. I. and E. Blackburn.

1335. A. Mickelthwait, J. Peace, and S. J. Hobson.

1333. E. Leeson.

1339. W. Smith.

1340. J. S. Cockings.

1341. S. Carr and G. Butterworth.

1343. J. Wansbrough.

1348. F. and A. Roberts.

1350. G. H. and H. R. Cottam.

1351. F. W. Saltonstall and A. Bush.

1358. S. Bury.

1357. S. Bury.

1370. A. R. Arrott.

1377. G. Davies.

1379. C. James.

1421. O. Maggs.

1448. N. C. Sherclomey.

1452. H. F. Smith.

1458. T. Cattell.

1457. T. Orrell, jun.

1539. W. E. Newton.

1559. T. Bell.

1599. J. Watkins and J. Pugh.

1778. E. Merrell.

2170. T. H. Daft.

2237. J. Macintosh.

2269. J. Macintosh.

2277. W. Macfarlane.

2307. A. and W. Balough.

2302. F. N. Clerk.

2310. W. Woofe.

2315. C. A. Tissot.

2323. L. C. Stuart.

2329. J. Brown.

2340. G. Collier and J. W. Crossley.

2367. A. and W. Balough.

2379. J. Barlow.

1915. H. Clayton.

1973. A. Country.

Warburton.

NOTE.—Specifications will be forwarded by post from the Great Seal Patent Office (publishing department) on receipt of the amount of price and postage. Sum exceeding 5s. must be remitted by Post Office Order, made payable at the Post Office, High Holborn, to Mr. Bennet Woodcroft, Great Seal Patent Office.

THE
MECHANICS' MAGAZINE.

LONDON, FRIDAY, DECEMBER 9, 1859.

THE TRIAL OF PATENT CASES.

How long are we to continue to adjust the rights of patentees by means of incompetent tribunals? It is notoriously true that a dozen men taken up-hazard, even when dignified with the name of a "special jury," cannot possibly decide with satisfaction upon the difficult mechanical, chemical, and other scientific questions which are continually claiming settlement in our law courts. Why then does not the Legislature provide other means for settling the rival claims of inventors and manufacturers?

We think there are signs that a change for the better in this respect is approaching. The judges are getting disgusted with the trouble occasioned by the present arrangement, and the annoyance of one judge would lead to removal sooner than the injury of a thousand patentees. Men who have not been slow to accept the duties and the fees pertaining to the patent system, both at the bar and as Her Majesty's Law Officers, do not hesitate to denounce the present mode of trying patent causes when they get seated upon the Bench. We have a notable example of this sort of thing in the case of the present Lord Chief Justice of the Court of Queen's Bench. Sir Alexander Cockburn derived not a few emoluments from patent law cases, both as an advocate and as an Attorney-General; but Lord Chief Justice Cockburn is, notwithstanding, greatly indisposed to sit idle for days on the Queen's Bench at Westminster while "special juries" are vainly endeavouring to master the mysteries of gas apparatus, permanent ways, Jacquard machinery, compositions for protecting iron, and so forth.

We have had an example of the impatience of his Lordship during the present week, at the sitting at *Nisi Prius*. An action was brought by Messrs. Crossley, carpet manufacturers at Halifax, to recover £2,000 from Mr. Talbot, a carpet manufacturer at Kidderminster, as royalty for the use of their patents in connexion with the Jacquard loom. The royalty was secured by a deed between the parties, and the defendant, by plea, denied that in making his carpets he had used any of the plaintiffs' inventions, or any part thereof. Before the case commenced, the Lord Chief Justice said there was another patent case in the day's paper, and he really could not take up the whole time of the sittings in trying patent cases. The case was then proceeded with, but Mr. Atherton, the plaintiffs' counsel, had not concluded the opening, when his Lordship suggested that it was a matter which might be much better settled by some scientific person from an inspection of the machinery than by an inquiry in court, which would occupy two or three days. Mr. Knowles, the defendant's counsel, said he quite concurred with his Lordship. At the end of two or three days the jury would not have arrived at the knowledge necessary to commence the investigation. The Lord Chief Justice then remarked that these patent cases were nuisances. Laymen, perfectly unacquainted with the points which they were called upon to determine, were not, he said, in such an advantageous position at the end of several days as a scientific person would be in as many minutes. A jurymen said he could confirm his Lordship's view. He had served upon a jury in the Court of Exchequer in a very similar case, and he believed that half of the jury were so confused

by the conflicting testimony they could scarcely arrive at any conclusion. The Lord Chief Justice said it was very difficult to decide between conflicting evidence in ordinary cases, but especially so when the subject-matter was not within their cognizance. A verdict was then taken for the plaintiff, with the damages in the declaration subject to a reference. Mr. Knowles said that all parties ought to be obliged to his Lordship for making the suggestion. He was certain that this case could not have been satisfactorily tried in any other way, and few patent cases could be satisfactorily disposed of by a jury. The conversation was then concluded by the Lord Chief Justice remarking that one mind conversant with the subject is infinitely better than twelve or thirteen who are not.

These remarks, by one of our youngest and ablest judges, must not be lost sight of. The evil complained of will not be easily remedied; but a remedy must nevertheless be sought. The difficulty to be overcome is manifestly that of securing professional ability free from personal bias.

THE CORT TESTIMONIAL FUND.

WHEN statesmen and others failed to deal even justly by the family of Henry Cort, Mr. William Fairbairn, the eminent engineer, wrote last summer to the *Times*, offering the handsome sum of £100 as a first subscription to a new Cort Testimonial Fund. About the same time the facts of the case came to the knowledge of Mr. Cobden, M.P., and Mr. Bazley, M.P., and these gentlemen at once spontaneously offered to aid the movement for the relief of the family in every possible way. A committee was subsequently formed, having Mr. Fairbairn for its chairman, and Messrs. R. Cobden, T. Bazley, J. A. Turner, Ivie Mackie, J. Whitworth, B. Hick, J. Penn, and J. Boyd for its members. This committee appointed Mr. David Morris, of Market-place, Manchester, its Secretary, and several handsome subscriptions were speedily obtained. Mr. Bazley added £50 to Mr. Fairbairn's £100; and Mr. Joseph Whitworth and Messrs. B. Hick and Co. each did the same at Mr. Cort's personal solicitation. All this was done many weeks since.

Thus far we have nothing but admiration to express in reference to the proceedings of this Committee. But a week or two since we received an official circular which fills us with surprise, and, as old advocates of the Cort case, we may even say with pain. This circular runs as follows:—"At a meeting of the Committee, held 7th November, 1859, in the Town Hall, Manchester, the Mayor in the chair; the Secretary reported that the sum of £210 had been paid into the bank of Sir B. Heywood and Co., and that £30 had been withdrawn and paid on account to Mr. Richard Cort. The total subscriptions to this date were reported as amounting to the sum of £200. Resolved—That a circular be prepared, and signed by Mr. Fairbairn, as Chairman of the Committee, appealing to all interested in the subject of iron manufacture, for co-operation and assistance to the CORT FUND, and that Mr. D. Morris, Secretary, issue such circular, accompanied by blank forms for subscriptions forthwith, so as to complete the labours of the Committee as early as possible. That when the subscription list is completed, the sum raised shall be invested in the purchase of annuities, or some other form of securing the comfort of the declining years of the survivors of the CORT FAMILY."

Now, the very ground of this Committee's formation—the very basis of the *Times'* appeal,

which Mr. Fairbairn followed up by his letter—the one fact which touched Mr. Cobden's tenderness in this matter—was the pressure of necessity under which the Cort family, all of whom are very aged people, are labouring. Immediate and liberal relief was the prime thing to be obtained. From our own intimate knowledge of the case, we can assert that at least £100 or £150 was most urgently required by Mr. Richard Cort, a man of 76 years of age, in order to meet liabilities incurred in prosecuting the case on behalf of his sisters and himself. With these facts before them, then, the Committee is formed, and £260 are, we are officially told, at once subscribed. Here, then, are the means of present and immediate relief at once secured; and the family will, of course, at once get the blessing of it. So every one would surely think; but not so think the Committee! They give Mr. Richard Cort £30—which cannot have repaid him the expenses incurred in soliciting the sums mentioned above—and put the remainder away in a bank! We do not see one word about the immediate relief of the family, even to the extent of paying what little debts they have incurred in endeavouring to secure justice for themselves; and as little do we hear about the relief of their pressing personal wants. What we do hear is, that "when the subscription list is completed"—and this may not occur for months, or even years; indeed months have already passed—then the sum raised "shall be invested in the purchase of annuities," or something of that sort, for "the comfort of the declining years of the survivors." Really this is too cruel! Declining years! Why the people are all between 70 and 80 now; to talk about their declining years is almost to mock them. Declining days!—declining hours!—declining minutes, we had almost said, are all they have to look for; and to tell them that by and bye they shall have annuities purchased for them, and meantime to lock £230 (which have been given to them) up in a bank, is really to insult and wound them to the quick.

Let us not be misunderstood. We give Mr. Fairbairn ample credit for meaning and purposing well. The whole thing of which we complain is doubtless an oversight. At the same time we cannot help pointing it out and asking to have it at once corrected. Matters cannot stand as they now are a single week after this announcement without bringing odium upon the Manchester Committee.

LIFE OR DEATH IN COAL MINES.

IN 1857 the Lundhill Colliery exploded, and blew 189 men into the next world. The accident arose from the absence of efficient safety lamps, the value of which was well understood at the time. Three months ago, during an excursion to Yorkshire, we descended this same colliery, and found in it an abundance of safety lamps of the right kind. The costly steed was stolen, and then the door was shut! We note this fact on commencing a few remarks on this subject, because it indicates that some of the worst colliery accidents even of the present day are preventable; and this fact is a light which will greatly help to guide us aright in what we have to say.

Mr. P. H. Holland, an Inspector of Burials under the Home Office, was officially called upon to report upon the safest method of burying the numerous victims of the great explosion at Lundhill. Two months elapsed before any of the bodies could be removed, and at the end of five months some still remained in the mine. Of course the removal and burial of so large a number of putrid corpses required the most

careful precautions, but neither skill, care, nor expense was spared; and the free ventilation secured, the use of McDougall's disinfecting powder and Dr. Stenhouse's charcoal respirator, and other precautions, were effectual in preserving all the men employed in this difficult, dangerous, and disgusting work from any serious injury. But the matter did not end here. Mr. Holland's mind became impressed with the awfulness of such accidents, and their prevention has since occupied his thoughts. The results of his inquiries and reflections have lately been given to the public in a valuable paper read at the Society of Arts.

During the last eight years there have been reported 8,015 deaths by colliery accidents, or 1,002 a year, out of about 220,000 colliers, showing a death-rate from violence exceeding four per thousand. We cannot calculate the exact proportion because we do not know the increase of the number of colliers since the census; but the death-rate by accidents among colliers is at least from six to seven times as great as the death-rate from violence among the whole population, including suicides, homicides, and the dangerous occupations. If these were excluded it is probable that colliery work would be seen to be eight or ten times as dangerous as the average. This is Mr. Holland's first great fact. In confirmation of it he states that the charge of the insurance company against death by accident is for colliers eight times the ordinary rate.

In order to show that this destruction of life is not inevitable Mr. Holland has prepared a very convincing table, which—as the accuracy of it was not questioned in a very sharp discussion that followed the reading of his paper—we may confidently assume to be correct. This table shows that in the Durham mines all the great causes of accidents—explosions, the falling in of roofs, and mishaps in shafts—and even the minor and miscellaneous causes of accidents, are guarded against with a degree of care which is altogether unknown throughout the colliery districts generally: in other words, that in the Durham mines, which are, to say the least, quite as difficult and dangerous to work as others, explosions do not occur, roofs do not fall, mishaps in shafts do not take place, and accidents generally do not happen, with anything like the same average frequency as they do in other colliery districts. In the northern districts, in which one-fourth of the coal is raised and nearly one-fifth of the total colliers employed, the deaths from explosions scarcely exceed one-twelfth, the average being only 21 out of 248 annual deaths from this cause, and these may be still further diminished by constant attention to ventilation, and especially by the use of such safety lamps as the men cannot open without extinguishing the light. It is expressly enacted in the 4th section of the Colliery Inspection Act, that “an adequate amount of ventilation shall be constantly produced in all collieries, to dilute and render harmless gases to such an extent as that the working places of the pits and levels of such collieries shall, under ordinary circumstances, be in a fit state for working.” And by the special rules, colliers are forbidden to enter the mines until they have been examined by means of a lamp, and found safe. If the simple and common rule were universally followed, of not allowing any unprotected light in any mine, until the part of the mine worked was found safe, there could, as Mr. Holland remarks, be no explosions except in those very rare instances in which an explosive admixture of gases and air is rapidly formed. Mr. Mackworth reported that seventy-two out of seventy-three explosions, and 171 out of 173 deaths, were attributable to the use of

naked lights, and that out of 1,154 deaths from explosions reported in five years, twelve only occurred where safety lamps had been used, all of which were in a defective state. Mr. Kenyon Blackwell's evidence confirms this. He says that “out of 1,099 deaths, seven only were with safety lamps, and adds that no instance has been properly authenticated of explosion from a proper safety lamp; and in the most dangerous mines of England, where the discharge of firedamp is greatest, but where locked safety lamps are exclusively used, explosions are almost unknown.”

But, to return, if the average loss of life were reduced, as it might be, to the average of the north, instead of 1,984 killed during the last eight years, there would have been only 845. That is to say, 143 lives are annually thrown away, because the precautions proved to be effectual in Durham are not observed in Yorkshire, Lancashire, Staffordshire, Wales, &c. “Is it unreasonable,” asks Mr. Holland, “to expect that the safety of all mines shall be raised to the standard of those of Durham, which are naturally among the most dangerous? Is it too much to require that the Act directing due ventilation shall be obeyed, and that the possibility of having an unguarded light in an explosive atmosphere shall be prevented?”

Falls of coals and roof are the most frequent cause of injury. The deaths from these accidents alone have been 2,971 in eight years, or 371 a year. Besides those killed by coal falling upon them, a very much larger number have been maimed and injured, often very seriously.

It is probable that no reasonable degree of care will completely guard against these accidents, but it is certain that they may be very much diminished, as is proved by the fact that in the northern district, which employs one-fifth of the men, there are only about one-eighth of the fatal accidents of this class. This great difference appears to be chiefly owing to the plan adopted in the north of employing men for the especial duty of looking after the safety of the colliers. In the northern district, about one in six of the men employed are what may be termed the safety staff, for superintending ventilation, keeping up roads, setting timber, removing obstructions, and doing things necessary for the safety of the others. In most other parts of the country, colliers are expected to do most of these things themselves, and they are very much less properly done, with the effect of an annual loss of 126 lives more than there would be if the danger were reduced to the Durham standard; and the northern mines are themselves susceptible of great improvement.

The most dangerous part of the collier's employment seems to be in the shaft, for though most of them pass but a small portion of their time in or near the shafts, more than one-fifth of the deaths occur there. That many of these accidents may be guarded against, is proved by the fact that many of them occur which the most simple precautions would certainly have prevented. In instancing this Mr. Holland remarks, “men could not be killed by falling stones or coals if the cages were properly covered. Few are thrown out of the baskets or skips, when cages with proper guide rods are used. Few are drawn over the pulleys when there are proper indicators, signals, and breaks, and when the engine driver's attention is not distracted by other duties. To neglect such means of safety is penal, but they are neglected, because their observance causes expense and trouble, and is not evidently and directly remunerative, though indirectly highly profitable.”

About one-sixth of the deaths, or 166 a-year, are caused by miscellaneous accidents, the chief of which are crushing by coal tabs, or by passing trains. Many of these are the consequences of bad discipline; the want of proper control to enforce obedience to rule. Some happen because the galleries through which coal trains pass are too low and too narrow. Some by the employment of machinery and horses, where hand putting, though dearer, would be less dangerous, and many, no doubt, from the reckless foolhardiness of the sufferers themselves. The young seem to be the peculiar victims of this class of accident, partly because they are chiefly employed in the galleries, partly from their want of experience and caution. About twice as many of the boys below 15 are killed, as is the proportion to the number of them employed.

The systematic inspection of collieries by Government officers has, doubtless, led to the introduction of many precautionary arrangements, and caused hundreds of human lives to be saved; but it has not produced all the improvement of which collieries are susceptible, and from the very nature of the case, as Mr. Holland points out, it never can. It was never intended that the Inspectors should be the substitutes for viewers, or mine engineers, who are so constantly employed by the owners of the northern mines (but not always elsewhere), to direct the general mining operations. If the Inspectors are to perform this duty, not only must their number be increased from 10 to at least a 100, but they must be invested with power enough to become in effect the real directors of the collieries in very important respects. Such an extension of the system of inspection and of Government control would evidently be highly impolitic, and quite at variance with our national feelings and habits. All that can be wisely attempted by penal law is to enforce such general regulations, and to compel the adoption of such precautions, as will guard against evident and almost universal dangers, leaving the details of management and the discipline of mines to those who alone can effectually execute such duties—those who employ and pay the men. This is Mr. Holland's view; and it is ours also. At the same time the reports of the Inspectors give ample proof both that precautionary regulations directed to be observed are very generally neglected, and that a very large proportion of the thousand annually killed are destroyed in direct consequence of such neglect; and this is confirmed, as we have seen, by the fact that in the northern districts, where precautions are best observed, the proportion of fatal accidents to the men employed is very much less than that in the whole country.

What, then, is to be done? Lives which might be preserved by reasonable and moderate precautions are now sacrificed; how shall we mend this state of things? how wipe away the reproach of it? It is not an easy thing to answer these questions wisely. But it is nevertheless very necessary to do so. The one explosion at Lundhill cost the proprietors nearly £20,000, and their work-people 189 lives. If the families thus impoverished had had annuities purchased for them, producing ten shillings a-week for ten years only for the family of each man killed, such annuities, at £200 each, would have cost £37,800. Here, then, was a loss of nearly £60,000 at a single blow, to say nothing just now of the unhappy men the marks of whose dead bodies were shown us in the pit in July last. The latter phase of the subject cannot be dealt with; the pecuniary part of it can, and in reference to it Mr. Holland makes the following proposals as a

basis for further legislative action in the matter:—"The cost of precautions, and of accidents which occur in spite of them, should be borne by the consumers of coal. The loss occasioned by accidents which might be avoided but are not, should be borne by those whose culpable negligence or cruel parsimony was the cause of them." So far the matter is plain enough; it is very easy to recognise the justice of these proposals; but to give legislative effect to them is not so easy. Mr. Holland, however, does not stop short of this.

This just and beneficial result might be attained, he considers, by one of two plans:—by a system of insurance against death by accident, or by such an extension of Lord Campbell's Act as would secure compensation to the families of those killed apparently in consequence of the neglect of any of the precautionary regulations legally ordered to be observed, unless it can be proved that the death was caused by the deceased himself; instead of its being necessary, as it now is, for the claimant of compensation to prove that the death was caused by the direct act or default of the master, whereas it is generally the neglect of some servant or fellow-workman, who alone is pecuniarily responsible, but from whom substantial damages can rarely if ever be obtained. He thinks that proved neglect, the probable cause of the injury, should be *prima facie* evidence that it was the real cause, and that coal-owners should compensate for injury suffered by those they employ, in consequence of breach of law either by themselves or their agents. The object would, however, he considers, be much more perfectly attained if no one were allowed to work in any colliery without being insured against death by accident, to a sufficient amount to secure his family from destitution; which would have the effect of compelling those to bear the loss who profit by the labour, and who can most control the result.

Mr. Holland contends for this proposition at great length, and with uncommon ability. He did not, however, convince all who heard him. Mr. Robert Hunt, F.R.S., Keeper of Mining Records, declared that he did not think a system of insurance would render the proprietors of collieries generally more careful as to the mode in which they carried on their operations. He "believed the proprietor's greatest interest was to preserve the lives of his men; for he knew that accidents happening in his mine were always attended with great cost to himself." We think Mr. Hunt in this observation begs the real question at issue. No one doubts that it is "the proprietor's greatest interest" to preserve the lives of his men, or that he is ignorant of the fact that accidents happening in his mine are "always attended with great cost to himself." But what is doubted is, whether mine proprietors really believe that to be to their interest—so believe it, that is, as to act upon their belief. We know they do not. The one fact of the Durham mines being so much better managed than the others proves that the proprietors in general have no living, operative conviction of this kind. They know, doubtless, that accidents, when they occur, are attended with great cost to them; but money loss from accidents *may not* be sustained, whereas the cost of precautionary measures *must* be borne if they are once adopted. Mine owners are like most other people in this respect, and prefer the risk of a great loss to the certainty of a small outlay. Mr. Hunt further stated that the proprietors were always, in his opinion, open to conviction, and willing to adopt real improvements when the necessity

for them was pointed out by the Government Inspectors. We doubt this, and think it would not be difficult to cite cases making strongly against it. If it be true, then the Inspectors must be the persons principally to blame for the excessive number of accidents in Yorkshire, Lancashire, Staffordshire, Wales, &c. Mr. Hedley, the Government Colliery Inspector for Derbyshire, spoke at the meeting, and coincided with Mr. Hunt's views, using like arguments with him. We dispute the reasoning of both; but we are willing to acknowledge that their want of confidence in Mr. Holland's insurance scheme may, nevertheless, be well founded.

The whole subject requires careful and prolonged consideration. The expression of hasty and unstudied opinions upon it can do no good. Mr. Holland deserves our best thanks for his paper upon it, especially for the fair and careful spirit in which it is conceived. Its delivery and publication, with the interesting discussion that followed it, must do good. The whole may be read in the Journal of the Society of Arts for December 2, 1859.

THE COMPASSES OF IRON SHIPS.

In completing our review of the Liverpool Compass Committee's Report, we come next to the subject of compass adjustment. Much difference of opinion has existed not only as to modes of adjustment, but also as to the propriety of attempting it mechanically in any way. Although this question may be considered as settled in practice, the Committee have not failed to give it their careful attention. They believed that in only one instance which requires to be named, besides that of the Royal Navy, is magnetic compensation dispensed with in iron ships, and that is in a line of steamers plying north and south for 1,200 miles on each side of the magnetic equator on the west coast of South America. The experience of the Committee proves that magnetic compensation is seldom so perfect as to dispense with the necessity for a table of deviations even in short voyage ships, while in ships making long voyages the change is frequently so great as to make a deviation table worthless, except for first clearing the land. This is more especially the case with steering compasses; and here the inconvenience complained of is as often want of *directive power* in the needle as the extent of the deviation or the difference between the indications of this compass and the standard. In almost all iron ships which sail round the Cape of Good Hope, perhaps in all which reach 40° south latitude and 40° east longitude, complaints are made of this. In the Great Britain, a temporary steering compass had to be fitted much higher than the one commonly used. In the Sarah Palmer the binnacle compass was quite useless, and a "vertical compass" fixed on the top of a companion, about seven feet above the poop, had to be fitted with lanterns, so as to steer by it instead. Reports of seven or more points of deviation are not unusual from ships traversing this part of the world. After deduction has been made for variation of the same name being included with the deviation, as may sometimes be the case, sufficient remains to show that upon some courses the earth's directive power must be most materially diminished. Statements of a similar kind have been made respecting some of the North American steamers. In both localities the earth's directive or horizontal force is small, and when it is further reduced by the opposition of the ship's magnetism, it will readily be seen how weak must be the directive power which remains. Slight causes will then turn the needle aside, or a small roughness of the agate or

bluntness of the pivot will prevent the card from traversing freely, perhaps from moving at all until it is entreated at a large angle; and then, by resting on the other side of the magnetic meridian, a report might next day arise of a sudden derangement of the compass from the ship being found forty or fifty miles on one side of where she was expected to be.

The want of directive power on some courses in uncompensated compasses is thought to be the strongest argument in favour of mechanical adjustment. The Committee's experiments on board the Royal Charter, with the deviations for her compasses obtained at Melbourne by the Rev. Dr. Scoresby, afford some interesting data. The Committee investigate the case of this ship at great length, and among other things they have arranged tables so as to contrast the deviations of the two compensated compasses with those of the Admiralty standard compass, both with and without magnets. After averaging the results of the three sets of experiments (not the most favourable mode of comparison for compensation by magnets), the ratios are:—

For the steering compass,	21 : 12	} in favour of compen- sation,
" companion compass,	24 : 22	
" Admiralty compass,	26 : 23	

even without any attempt to correct the original adjustment; and this is a new ship—one, therefore, subject to extreme changes. It is worthy of notice, say they, that adjustable magnets were fixed to the steering compass, but their position was not altered during the voyage, and most fortunately so, for otherwise the comparison could not have been so perfect. The result shows that had the compensating apparatus been employed, as was intended, the whole of the adjustment which was required is the following:—1. To screw the fore-and-aft magnets a fraction of an inch nearer the compass card at Melbourne, and to screw them back again a little as the ship returned to Liverpool. 2. To screw the transverse magnet (which was rather above the middle of its containing box) gradually lower and lower through the whole of the voyage until the ship's return to Liverpool, when it would probably be at the bottom of the case. Simple as this appears, it would thus have been possible to keep the steering compass correct, and to give the needle the full effect of the earth's directive power. This is possibly an extreme case, and the relatively small change in the steering compass may be due to its position so far forward as in front of the mizen-mast. In another instance of a compass placed very near the stern-post of an iron sailing ship, where the adjustable magnets were also applied and actually used, the following movements took place:—The three fore-and-aft magnets had to be gradually removed as the ship went south, and afterwards two were required placed the reverse way. In this condition the ship rounded Cape Horn. Before reaching Valparaiso one of these magnets was again removed. On the homeward voyage one fore-and-aft magnet, placed in the original direction, was sufficient while within the tropics; and another was required on reaching 40° north. Only one transverse magnet was in place when the ship left Liverpool. While in the southern hemisphere, a second was required in the same direction. On the ship's return, one magnet athwart-ship was found to be sufficient; but it had to be screwed to its highest possible position in the case. In the previous voyage (the ship's first), before the captain knew how to use his adjusting magnets, the deviations were so excessive that he had to remove the magnets altogether.

Though the various modes of compensation now in use are mostly founded upon the expec-

ments and instructions of the Astronomer Royal, the Committee regret to find that several modifications are made by adjusters, which appear defective, and in some instances liable to produce much mischief. Some adjusters omit the chain-box or soft iron compensation for correcting the horizontal induced magnetism of the ship, and thus ignore the quadrantal deviation altogether. If tables of deviation were always given this would not be of much moment, but captains are sometimes led to believe that the adjustment is complete without it. Others attempt compensation who appear quite ignorant of its nature, and make vain efforts to correct a ship's attraction with permanent magnets only. Theory and practice combine to prove that when the chain-box compensation is once properly applied, no further change in it is required whatever be the voyage; and the Committee feel confidence in expressing the opinion that it should never be neglected. The chain-boxes at present in use are seldom large enough to correct more than 3° or $3\frac{1}{2}^\circ$ of quadrantal error. They may with advantage be made of twice their present length. The increased length would also tend to correct a portion of the errors which generally arise from heeling. In many cases the Committee have observed the use of oblique, inclined, and vertical magnets in positions which must necessarily produce large errors when the ship heels. In one instance an error of four points was reported from this cause. The Committee object to the ordinary use of any but the horizontal compensating magnets, and would always have them placed fore-and-aft or athwart-ship—not only for the reasons already stated, but also because the oblique positions render any attempt at change while at sea by the captain more difficult, and make his attempts at compensation in the same way almost hopeless. Horizontal magnets, if placed near and below the compass bowl, may also have an injurious action, and possibly have given rise to some of the fluctuations in the deviations recorded of some floating compasses. One captain, when spoken to on the proximity of a compensating magnet to his steering compass, said he observed when it was first fixed how a small difference in its position affected the compass needle; yet he stated as a matter worthy of attention, that on one occasion when water from a rusty tank was used to float the compass bowl, the rust in the water so changed his deviations that he was obliged to take it out again. It had not occurred to him that the difference in the level of the bowl might have been the real cause. In this, as in many similar instances, the facts may be accepted when the explanations or alleged causes are inapplicable. When circumstances will not admit of the compensating magnets being placed a sufficient distance below the compass they should be fixed on the same level as the card.

The projection of deviation curves (to which subject we next come) has been recommended as a means of obtaining a table of probable errors on every point of the compass from observations made on a few points only. Napier's method of projection, or the modification of it by Captain Ryder, Royal Navy, is also extremely valuable for converting compass courses into magnetic courses, or the reverse. Sufficient attention to this, or even the knowledge that it is necessary, is exceedingly rare in the merchant service. Few captains or compass adjusters appear aware that considerable difference may exist in the deviation between ship's head by compass and ship's head true magnetic on the different points of the compass. It is neither taught to them nor noticed in any

way in the examination for a certificate of competency. In many deviation tables it is left to be guessed whether "ship's head by compass" or "ship's head true magnetic" is intended. In nearly every instance they are given for "ship's head true magnetic," the reverse of the practice of the Royal Navy. The projection of deviation curves is also useful to the initiated, for the purpose of testing the probable accuracy of the observations, and the care which has been taken in swinging ship. Some examples are given of this by the Committee: one may be taken as an instance. On noticing that the west deviations very much exceeded the east deviations in amount, while the curve showed general symmetry, it was conjectured that the "lubber line" was not towards ship's head. Examination proved this to be the fact, and showed that the binnacle (as in many other cases) was only secured by lanyards, and that through these having become slack "the standard bridge compass" was "considerably slewed." It proved, too, that the ship had been swung with the binnacle in this position, and that she had so made the voyage from Bristol to Liverpool. This was also confirmed by a second swinging under the direction of the Committee. Though this careless mode of fixing a standard compass was pointed out to the captain, and he immediately gave directions to the carpenter to secure it with wooden cleats, the ship left England for the first time without its being attended to further than by "taking in the slack" of the lanyards. Similar cases have been observed. Compass records from such ships are entirely valueless.

Among the miscellaneous operations of the Committee may be noted the distribution of circulars conveying information as well as asking for it. Copies of some of these, with new editions of old ones, are appended to their Report. The Committee have also examined as far as possible all new inventions relating to the compass or compass management, and have considered various suggestions for facilitating the detection of compass errors at sea. No remarks have been made by the Committee upon the changes in the magnetism of iron ships produced by collisions at sea. Records of one or two cases have been obtained, and the attempt has been made to get others. It is difficult to obtain reliable evidence—not so much personal, as respecting the previous condition of the ship's compasses. In some instances iron work, so near as to influence the compass, has been carried away; in others the vessels have been in sight of port and the compasses were not noticed, while considerable repairs and alterations have been made before the ships again went to sea. In another case the steamer went her usual voyage in foggy weather after the collision, and nothing amiss was observed. Another steamer, ever since the collision by which an iron sailing ship was sunk, has been lying alongside other iron vessels, and the captain can offer no information.

The Liverpool Compass Committee, in concluding their able Report, delicately intimate to the Lords of the Committee of Privy Council for Trade that a better and perhaps more satisfactory view of one portion of the subject could be obtained in six months by the action of the Board of Trade than the Committee could hope to gain in a much longer period. "There is more than an appearance of unfairness," says the Report, "in a number of private individuals requesting copies of deviation tables and information of this kind from compass adjusters and others, and then using the information thus kindly granted to prove the incompetence or carelessness of some of the donors. Compass adjusters, the competent

"and incompetent alike, already suffer from imputations which do not attach to them." A sufficient degree of information on this intricate subject can scarcely be expected at present from the merchant captain, or he might superintend and control the operations of swinging ship and adjusting compasses in the same way as he does any other duty which devolves upon him. Even where an interest is felt in the subject, the great demand on a captain's time, at the busy period of fitting for sea, usually prevents him from doing more than inquire the errors on one or two particular courses, and to charge the adjuster "not to compensate her too much," as he does not like "too much compensation." As to the general distribution of the ship's magnetism, or the real nature and direction of the force which will be constantly pulling at his compass needle, perhaps neither he nor the compass adjuster has any adequate conception. In some cases the captain will stand by in a sort of selfish spirit and see that everything is done which the compass adjuster requires, but will abstain from making any remark or expressing an opinion, so that if perchance anything goes wrong afterwards the whole of the blame may be thrown upon the adjuster; or if this expression be too personal, that the fault may be placed upon "the compasses." Until masters are competent to attend fully to the subject, some kind of authoritative supervision in this matter would undoubtedly be beneficial; but the Committee confine themselves at present to showing how proof of this may be obtained. Copies of all deviation tables which may be given both for adjusted and non-adjusted compasses; particulars as to the number, direction, and distance of the magnets which may be applied for compensation; and the amount of original error on two cardinal points 90° apart, would afford ample information to any one competent to examine such returns on nearly all that requires to be known on this part of the subject. Information somewhat of this kind was collected for a short period by Mr. Towson, of the Local Marine Board, and Mr. Hartnup, of the Liverpool Observatory, under authority from the Board of Trade. From such data correct inferences may be drawn as to:—1. General ability of the adjuster. 2. Whether the ship was properly swung. 3. Approximate amount and direction of ship's magnetism at the position of each compass. 4. To what extent compensating magnets are placed in positions which are known to produce great and variable errors on the heeling of the ship. 5. By returns from the same ship each time she is swung or re-adjusted; information as to the changes which may occur in her magnetism. Returns similar to those which have been suggested can cause no delay, or in any way interfere injuriously with the captain, the merchant, or the ship-owner, while they would afford some sort of guarantee to each that an important subject is being adequately cared for. It must also be evident that occasionally, in cases of accident, these records would afford valuable evidence.

In a future article on this subject we shall complete what we have to say by a reference to some facts recently made public by Professor Airy, the Astronomer Royal.

It is useless to discuss at present the question at issue between the directors of the Great Ship Company and Mr. Scott Russell, because the whole business is before the three gentlemen who were fixed upon as arbitrators when the contract was undertaken. The Great Eastern is the first example we have met with of a costly ship being systematically and unjustly depreciated by those who should be the last to undervalue her.

Proceedings of Societies.

SOCIETY OF ARTS.

Nov. 25.—The paper read was on "CHINA, and its relations to British Commerce," by Sir JOHN BOWRING, F.R.S. After dealing at considerable length with the broad features of his subject, Sir John proceeded to remark upon the stationary character of the Chinese, and spoke as follows:—"Looking into the early history of China, I find that 4,000 years ago the art of drawing was thoroughly understood, that mountains were levelled, that valleys were raised, and that agriculture was carried on in a state of perfection, beyond which it has not progressed a step. I find that 2,200 years before Christ, the Chinese people were clad in silk; and there is a very ancient proverb which says it is an opprobrium to a man who, having reached the age of fifty, does not possess a silk garment. I lately stumbled upon a passage in a history of the second century, in which I found a description of the manufacture of paper in all its detail, from rags reduced to pulp, and which, by pressure, were made to give a paper upon which the Chinese were in the habit of writing, while it is notorious that in Europe the manufacture of paper was contemporaneous with the invention of printing, and, perhaps, more important than the invention of printing itself in the advancement of civilisation. Many of the discoveries which are modern in Europe are ancient in China. It is impossible to say when the Chinese had not the printing art. The mariner's compass, it is notorious, was possessed by them hundreds and hundreds of years before we had any knowledge of it. There is a description even of iron boats and rotatory paddles at a remote period. Every one knows of what antiquity is their beautiful porcelain. So far from progression, I am sorry to say that these arts are in a state of decadence in China, and the value of porcelain is now estimated by its age. In consequence of some porcelain having been found, either in the pyramids or in the ruins adjacent to them, it was maintained that there must have been intercourse between China and Egypt, and that these, bearing as they do undoubtedly Chinese inscriptions, and being filled with cosmetics or perfumes, or with the valuable produce of the East, contained evidence of the existence, not only of the Chinese language three or four thousand years ago, but of intimate relations between India and China. The fact led to investigation, and we were enabled to trace in the poets of China every inscription that was found upon these curious porcelain jars; and this showed that they could not have had an earlier existence than the period at which these poets lived, which was between the eighth and the tenth centuries, certainly a very curious and not uninteresting fact. While I feel how much backwardness there is in China, and that in many matters there is a great deal to learn, I know that we might communicate to them much very valuable knowledge. The only instance in which, so far as I know, they have generally adopted the improvements of the West, is in the general use of fire engines, which are found in many of the principal cities in China, and which are worked with very great activity and dexterity. China, I think, might teach us something in other matters. In a collection that I made for the town of Sheffield, it was discovered that they had the art, I believe wholly unknown in Europe, of hardening brass to the consistency of steel; and there are brass instruments made in China at this moment of exceeding delicacy, that have all the power which we give to steel. I think also that something is to be learnt in the chemical field of inquiry. Many of the colours of China are very superior to those of Europe. There is one colour which has led to some curious investigations, namely, a perfect vegetable green. They have a green indigo, which is a permanent colour. Now I believe up to the present time we have never been able to make a green which will resist all the changes of temperature and climate. I have suggested, on two or three occasions, when I have

had the opportunity of giving advice, that it is exceedingly important, now that China is likely to be opened to European inquiries, that intelligent persons should be sent there, in order to see whether, from the experience of these forty centuries, something might not be gathered up that is of practical value. Intercourse may lead to the removal of many of their prejudices, but without that intercourse it is impossible to alter the stereotyped character of the Chinese. They treat us with disdain, and often with perfidy; but they are all educated under the idea that we are no better than 'barbarians,' and that we ought to be dealt with as if we were wild beasts. Such are the teachings of their philosophers, who represent that the world is divided into two great portions, that its centre is under the canopy of Heaven—the ordinary name which they give to their country—all civilisation being under this canopy, and that besides this there is the barbarism which is beyond. We represent that barbarism; and in discussing the matter with the Chinese, they say, 'You are great fighters; you have attended to the art of war, and we have not, but you have no civilisation; you have no language that is intelligible. It is true, you are taught to write, but then we see a man who comes from a nation of three or four millions of people, and on the other side of the water there is another nation of three or four millions, and the writing of the man on one side of the river is given to a man on the other side of the river, and he cannot make out a word of it.' They say, 'We are three or four hundred millions of people who cannot, indeed, understand one another's talk, but everybody understands what everybody writes.' I never found a Chinaman embarrassed when he met a man from a distant province, for though their spoken idioms are different, their written signs are identical. Failing to be understood in speech, the Chinaman makes a mark on his hand, and he is understood immediately. The Chinese often taunt us with the imperfection of our education and the narrow scope of our language, and in this respect deem us inferior to the natives of Japan, Corea, or Siam, who can read the Chinese character."

INSTITUTION OF CIVIL ENGINEERS.

Nov. 22, 1859.—Joseph Locke, Esq., M.R., President, in the chair.

The whole of the evening was occupied by the discussion, commenced at the last meeting, upon Mr. Amos' Paper, "ON THE GOVERNMENT WATER WORKS, TRAFALGAR SQUARE."

Nov. 29, 1859.—Joseph Locke, Esq., M.P., President, in the chair.

The paper read was "ON ARTERIAL DRAINAGE AND OUTFALLS," by Mr. R. B. Grantham, M. Inst. C.E.

The author commenced by giving an extract from Mr. Simpson's address, delivered in January, 1854, describing the general state of many important districts, in which property to a large amount was rendered useless, from the want of a proper system of arterial drainage, and of the improvement of the trunk lines, or principal water-courses. The legal difficulties in the way of carrying out works of this character, led the author to think that some general legislative measure was necessary—such as Earl Carlisle's Bill, proposed in 1852, which, in his opinion, was the best that had been suggested—before the great object of improved arterial drainage and outfalls could be attempted on a comprehensive scale, or be effectively maintained in working order.

The subject was treated under the following heads:—First, attention was called to some of the evils arising from the want of a combined system of operation. Secondly, an account was given of the impediments which exist to prevent the adoption of arterial drainage. Thirdly, the class of works necessary to be carried out was described. And, lastly, some of the leading principles in the construction of drainage works, to accomplish the object in view, were pointed out.

The paper then went on to state, that there

was, perhaps, scarcely a district in this country where one of two conditions did not exist; either the lands could not be drained at all, or they were injuriously affected by the drainage of those above them. Instances were given in illustration of these two conditions; and it was remarked that, in many cases, a single person, who was unwilling to drain his property, might prevent any improvement by adjoining owners.

Owing to the extensive system of subterranean, or pipe drainage, and to the field drains and ditches being better cleared out than formerly, there had been a large increase in the water flowing down rivers, brooks, and minor streams. The effect of this was, that the water was discharged in a shorter time, causing more frequent floods, as the brooks and streams were of inadequate size; and at other times, the rivers and streams contained less water than formerly, in many cases not sufficient for the supply of the towns and country dependent on them. To give some idea of the magnitude of this system, it was stated that, within the last ten years, about four millions sterling had been expended in the drainage of 800,000 acres, under the control of the Inclosure Commissioners of England; and it was estimated, that probably twice that amount had been laid out by the Crown, by corporate bodies, and by private individuals. For full details of the progress and results of the underdrainage of land in Great Britain, the members were referred to Mr. Bailey Denton's paper, read before the Society of Arts in December, 1855.

The tendency of mills, weirs, dams, and other obstructions in rivers, as well as the crooked and confined channels of the rivers themselves, to impound the upland waters, was next adverted to. And, on the other hand, the injury which lands suffered, by being inundated by the drainage of the uplands, from the want of combination among the possessors of property, was shown. Both these cases were illustrated by a proposed drainage in the vicinity of Wareham, Dorsetshire.

The impediments which at present exist, to prevent arterial drainage being carried out on a combined system, were attributed mainly to the state of the law; which required to be modified and changed, and its powers enlarged and liberalised, as had been previously stated. The points which more immediately concerned the Engineer were, the straightening and deepening both internal and tidal rivers, and the removal of mills, dams, weirs, and other obstructions, in order to produce uniform inclinations towards the outfalls of streams. The gradients, or inclinations, must be adapted to the soil through which the rivers flow, to obviate the scouring action of the water on the banks and bottoms of their courses. It was also necessary to impound the surplus water, so as to preserve a uniform minimum supply to the channels of rivers at all times; to provide works available to take off field drainage, and for the irrigation of adjoining lands, for the reconstruction of bridges and culverts under public roads, and for the application of the water to the supply of towns and villages, which, in many instances, might be altogether deprived of their supply by any through system of drainage.

The arterial drainage and outfall works executed in Ireland since 1816, the year of the famine, were then alluded to, as forming the best examples of such works in the United Kingdom. Probably the largest work in the world, in reclaiming an extensive area of country from the effects of stagnant water and floods by arterial drainage, was that in the Fen Districts, commonly called the Bedford Level, to which attention was next directed at great length. The author then referred to the means adopted by the Norfolk Estuary Company for the reclamation of land; and next to the Ancolme Drainage, an account of which was presented to the Institution in 1845, by Sir John Rennie. In this paper, as well as in all that had been introduced relative to the Fen district, some of the leading principles of the drainage of level areas, and of improving rivers in flat countries, were noticed. These were, first, the formation of catchwater drains for intercepting

highland waters; secondly, separating, as much as possible, navigation from drainage, in improving rivers; thirdly, the slopes, or inclinations that the bottoms of rivers, or newly cut drains, discharging into tideways, should be formed to; fourthly, the depth at which the cills of outfalls into tideways should be laid; and lastly, the formation of overfall weirs and reservoirs, for the retention of mud and sand. Some large drainages in Yorkshire were then referred to, and it was mentioned that an estate of about 2,250 acres, at Thornton, near Pocklington, was at this time suffering considerable injury from the want of facility for draining the water from it. When Hainault Forest, lately a Royal Forest, was disafforested in 1853, the allotment made to the Crown contained about 2,000 acres. This consisted of a level plain, part of which was known as Fairlop plain, lying at the foot of a ridge of land sloping towards the south. Another ridge projected into it from the east, and at the foot of these ridges were valleys, which brought down the water from beyond the limits of the Crown allotment. The first operation in the reclamation was that of making the roads and arterial drains. The three principal valleys were the Dog Kennel Brook, extending from Little Heath, on the southern boundary of the allotment, to the northern boundary, where it branched towards the north-east, the Well Ridden Brook, branching off from the Dog Kennel Brook about half a mile from Little Heath, and towards the north-east—and a main drain, on the opposite side, which received the drainage of the west and north-west parts of the allotment, and of the lands to the north of it. In each of these valleys, regular open drains had been formed, into which all the pipe drains were discharged. The Dog Kennel drain was 6 feet wide at the bottom, and from 4 feet to 5 feet deep at the outlet; the bottom width, diminishing gradually to 2 feet at the upper end. The inclinations were 1 in 528 for the lower part, and from 1 in 125 to 1 in 200 for the upper part. The natural fall of the valley was steeper than this. Therefore overfalls, varying from 3 feet to 10 feet in width of opening, and from 3 feet to 5 feet rise, were constructed of brick-work at different points. These were capable of being made into dams, by inserting boards into grooves, for storing water in dry seasons, for cattle or other purposes, and for irrigating the land on both sides. The system adopted was to have as few open drains as possible, and large mains. The area of land gained for profitable cultivation was thereby increased, and the labour of tillage reduced. It was found that the agriculturists neglected the mouths of under drains, if they were numerous, so that it was good economy to reduce the number to a minimum. This forest, which, from time immemorial, had been almost a waste, was now a valuable farm; and what was formerly a refuge for thieves and poachers, now afforded the means of profitable employment to many persons.

The author then proceeded to refer to the manner of dealing with rivers in India and in Northern Italy, quoting, principally, from the published works of Capt. Baird Smith, M.E., and Paul Frisi. The tanks or reservoirs which abounded in the Madras Presidency might, it was believed, be connected with arterial drainage works, especially in rapidly inclined countries, and be useful as aids to agriculture, and for the supply of towns. In upland or internal rivers and streams, such as those last alluded to, the leading principles to be observed in their improvement were—first, straightening the channels from the source to the outfall; secondly, making them of sufficient width to include all the flood waters, having regard to the inclinations; thirdly, the formation of shallow, rather than deep drains, in nearly all kinds of soils; fourthly, the regulating or adjusting the inclinations of the bottoms, so that the velocity of the water might be checked, to prevent the erosion of the sides and bottoms, and the removal of the gravel, sand, and mud to the lower levels; and lastly, providing the means of storing up the water in reservoirs or tanks, apart from drainage, at convenient points, for agricultural and industrial purposes.

The paper concluded by noticing the Commissioners of Sewers, first instituted in the reign of Henry VI., who were acting in every part of the country, having jurisdiction on the borders of the sea or tidal rivers. Their duties were to repair sea or river banks, and to keep the main drains and outfalls of level districts in repair, and clear them for the passage of water. Their powers were not sufficiently extensive, and it was stated that their constitution would have to be remodelled in the event of any fresh legislative measure being carried upon this subject.

Dec. 6, 1859.—Joseph Locke, Esq., M.P., President, in the chair. The discussion upon Mr. Grantham's paper "On Arterial Drainage and Outfalls" was continued throughout the evening; but, as it was not concluded, the publication of the abstract is deferred.

It was announced that the Annual General Meeting would be held on Tuesday, December 13th, when the annual report would be read, and the ballot for the President, Vice-Presidents, and other Members of Council, would take place.

At the monthly ballot the following candidates were balloted for and duly elected:—Messrs. A. C. Crose, W. H. Pyrdon, and W. Stanley, jun., as members; Messrs. J. Aird, jun., E. Cottam, W. H. R. Curll, J. B. Dunn, I. Evans, J. Fisher, jun., F. Jenkin, J. Kimber, I. H. Latham, J. F. Stokes, J. Taylor, and I. Thwaites, as Associates.

ROYAL GEOGRAPHICAL SOCIETY.

A crowded meeting of this Society was held on Monday evening, at Burlington House; Sir Roderick I. Murchison, Vice-President, in the chair.

Presentations.—The Hon. Robert Marham, William Fryer, and George Lee, Esquires, were presented on their election. Numerous noblemen and gentlemen were elected fellows, and others proposed. The chairman announced that he had that day received from the Duke of Newcastle a notification of the safe arrival of the British North American Expedition under Captain Palliser at Fort Colville.

Sketches in Burmah, Punjab, Himalayas, and Kashmir, by Captain H. H. Godfrey Austen, F.R.G.S.; Sketches of the Scenery, &c., on the Zambesi, by Thomas Baines, F.R.G.S.; Photographs of Ancient Hindoo Temples, by W. H. Purdon, F.R.G.S.; Sonnenstern's Map of Central America, &c., were exhibited to the meeting.

The papers read were:—

1. Sun Signals for the Use of Travellers. By Francis Galton, F.R.G.S.—If a piece of looking-glass be held in such a position that a person at a distance can see some portion or other of the sun's disc reflected in it, it assumes the appearance of an exceedingly brilliant star of solar light. The object of Mr. Galton's invention has been to provide an optical arrangement by which the signaller may know whether he is holding the mirror aright. The smallest size of hand heliostat can literally be carried in the waistcoat pocket, yet, by its means, whenever the sun is shining, a signal can be instantly made that shall be visible to the entire neighbourhood of any given spot within sight. A distance of twelve miles, on a day of average clearness, is well within the power of this little instrument. If the flash be replied to, a regular communication can be carried on, in which the signals are varied by gentle movements of the hand that causes the flash to be seen and to disappear; alternately words and sentences are communicated by a notation of long and short flashes identical with the notation of long and short beats that is used in Morse's electric telegraph; but, independently of this more refined sort of telegraphy, the mere power of calling attention from great distances, and of conveying three or four simple signals, such as a series of single flashes for affirmation, and of doubles for negation, is of the highest consequence to a traveller. The principle of the instrument and the intensity of the flash, under varying circumstances, were explained in detail, and a number of hand heliostats, some of them made for Mr. Galton, by Messrs. Troughton and

Simms, were laid on the table. Sir Edward Belcher and the Astronomer Royal of Cape Town testified to the enormous distance at which heliostatic lights were visible when employed in triangulating a country.

2. Latest accounts from the Central Africa Expedition from Dr. Livingstone, F.R.G.S., with Illustrations.—Dr. Shaw remarked that, as the papers were very voluminous, a few only of the more interesting extracts could be read. The first portion, dated May 12, 1859, and addressed to the Earl of Malmesbury, gave an account of Dr. Livingstone's journey to Shirwa, a large inland lake. The lake in its wide part might be from 25 to 30 miles in breadth, and was of a pear shape; only the narrow portion was prolonged some 30 miles south of the body where the travellers stood. There was an inhabited mountain island near the beginning of the narrow part. Its length might be from 60 to 70 miles, not including the southern narrow portion of 30 miles. The height of the lake above Chibisa Island, where they left the ship, was 1,800 feet, and 2,000 feet above the level of the sea. Mount Zomba, in its neighbourhood, was 6,000 feet high. The whole region was well though not densely peopled. The Portuguese did not even pretend to know Shirwa. Frequent inquiries were made of the natives as to whether any white men had ever visited them before, and they invariably replied in the negative. Dr. Livingstone, therefore, claimed the first discovery for himself and party, although the Portuguese took the honour for themselves. The Manganya cultivated the soil very extensively, and more men than women were sometimes seen at this occupation. The soil was very rich, the grass generally from six to eight feet long. A few yards' distance often completely hid a companion, and guides were always necessary. Gardens were common high up the hills and on their tops. Cotton was cultivated extensively, and the farther they went the crop appeared to be of the greater importance. The women alone were well clothed with the produce, the men being content with goatskins and a cloth made of the bark of certain trees. Every one spun and wove cotton. Even the chiefs were to be seen with the spindle and distaff. The process of manufacture was the most rude and tedious that could be conceived. Almost every village had a furnace for smelting black magnetic iron ore. A people to the N.N.W. had manufactured a rude imitation of a pistol, which they fired only on occasions of mourning. They were not aware that it could propel a ball.

Another paper was also read on the navigation of the Zambesi, which he stated to be *navigable*. In ascending the river they burned no less than 150 tons of lignum vitæ to generate steam, the value of which, at London prices, was £300. In the midst of great disadvantages they had travelled upwards of 2,350 miles of river. From October, 1858, to June, 1859, 5,782 elephants' tusks had gone down the Zambesi from Tete alone. Two-thirds of these were large, or upwards of 30lb. each, and the weight of the whole was 100,000lb. The merchandise was conveyed in unwieldy canoes, which cost from £60 to £70 each. The Americans were absorbing all the trade of the east coast below Zanzibar.

The President also read extracts from letters which had been addressed to himself, and announced that he had the assurance of Lord John Russell, the Foreign Secretary, that every aid which he could afford would be given to Dr. Livingstone.

An animated discussion followed the reading of the paper, in which the Astronomer at the Cape, Mr. Crawford, Mr. McLeod, and Captain Bedingfield joined; and

The chairman, in adjourning the meeting to the 12th December next, stated that there was another and very important paper on the list, on "The Trigonometrical Survey of Kashmir," the original MS. of which, by Captain Montgomerie, F.R.G.S., was suspended in the room; but as the hour was already advanced, the subject would be postponed until the ensuing meeting.

GEOLOGICAL SOCIETY OF LONDON.

Nov. 30, 1859.—Prof. John Phillips, President, in the chair. Sir Walter James, Betschanger Park, Kent; George Dawes, Esq., Milton Ironworks, near Barnsley, Yorkshire; the Rev. Julian Edmund Woods, Penola, South Australia; Bassett Smith, Esq., 1 Elm Court, Temple; Captain—Hickens, Bengal Engineers; Lionel Brough, Esq., one of H.M. Inspectors of Coalmines, Clifton; John Studdy Leigh, Esq., St. Stephen's Terrace, Bayswater; and John Pope Hennessy, Esq., M.P., were elected fellows.

The following communications were read:—
1. "On some Bronze Relics from an Auriferous Sand in Siberia." By T. W. Atkinson, Esq., F.G.S. 2. "On the Volcanic Country of Auckland, New Zealand." By Charles Heaphy, Esq. Communicated by the President. 3. "On the Geology of a part of South Australia." By T. Burr, Esq. From the Colonial Office. 1848. 4. "On some Tertiary deposits in South Australia." By the Rev. Julian Edmund Woods. Communicated by the President.

MANCHESTER LITERARY AND PHILOSOPHICAL SOCIETY.

Ordinary Meeting, Nov. 29th, 1859.—Dr. R. A. Smith, F.R.S., Vice-President, in the chair. A letter from Mr. Dyer was read relative to Mr. Jevon's paper. Mr. Dyer is led to conclude, from the facts which have been ascertained respecting the distribution of gold, that that metal forms a great part of the material of the earth's crust now in an incandescent state.

Mr. F. O. Ward laid before the Society an instrument termed a PSEUDO-DIASCOPE, and a paper setting forth its construction and use, and the principle it is designed to illustrate. By means of this instrument an aperture transmitting light is made to produce on one eye an isolated impression, while the other eye is directed to an opaque body, such as the hand held before it. The image of the aperture is then found to be transposed, and its perception ceases to be assigned to the eye by which it is really seen; the effect being that a perforation appears in the opaque body, through which the light seems to shine upon the eye by which this is viewed. The principle illustrated by this instrument, according to the author's view, is the essentially goniometrical and deductive nature of the visual act, whenever the distances of bodies are perceived, and their relative positions in space assigned. A Pseudo diascope was presented to the Society by the author, and the singular illusion produced by it was verified by the members present.

Mr. F. O. Ward subsequently laid before the Society a plan of his for diminishing THE LIABILITY OF POWDER MILLS TO EXPLOSION, and referred to a correspondence between himself and Dr. Faraday on the subject. The plan in question consists in supplying to those portions of powder mills in which the powder is treated dry, an atmosphere incapable of supporting combustion—preferably carbonic acid gas—so as to obviate the danger of explosion so far as it arises from chances of ignition *ab extra*—as by the spark from a workman's pipe, of which an example was cited. The danger of explosions from the liberation of oxygen from the powder itself, by friction or otherwise, would of course remain; but this the author inclines to believe is a less frequent cause of explosion than ignition *ab extra* occasioned by the carelessness of workmen rendered indifferent to risk by long habit and emboldened by impunity. Dr. Faraday, in his comments on this plan, approves it as adapted to cut off one class of risks, and so to remove the point of danger further off, and also as not likely to deteriorate the quality of the powder immersed in the protective atmosphere. He points out, however, as a source of danger usually unsuspected, the possibility of the ignition of the gunpowder dust which collects on the beams of powder mills, and by which, he believes, explosions may be originated, as well as by the heating of the grains actually under trituration in the mill. Mr. Ward, in reply to Dr. Faraday, recognises the

partial nature of the security afforded by the proposed plan, but lays stress on the fact that it appears adapted to eliminate all the risks of the manufacture, except those which are inherent in the nature of the material operated on, and therefore essentially incurable.

A paper entitled "SUPPLEMENTARY RESEARCHES IN THE HIGHER ALGEBRA," by James Cockle, M.A., F.R.A.S., was read by the Rev. Robert Harley, F.R.A.S.

A paper was read by J. P. Joule, LL.D., F.R.S., entitled "EXPERIMENTS ON THE TOTAL HEAT OF STEAM."

The author showed that what is called the total heat of steam, or the quantity liberated when steam is condensed into water of 0° centigrade, consists of, 1st, the true heat of evaporation; 2nd, the heat due to the work done on the steam during the condensation; and, 3rd, the heat liberated by cooling the water from the temperature of condensation to the freezing point. The determination of the total heat of steam had been made the object of a very careful and elaborate research by Regnault, but it appeared to the author that independent experiments conducted in a different and more direct manner would not be without interest. The following is a summary of the results obtained by him compared with those of Regnault:—

Total pressure of steam in inches.	Total Heat in Degrees Centigrade.	
	Author.	Regnault.
37.25	638.43	638.77
57.53	644.77	642.87
111.58	655.45	649.06

A paper was also read by Dr. Joule, entitled "ON A METHOD OF TESTING THE STRENGTH OF STEAM BOILERS."

The author adverted to the means hitherto adopted for testing boilers. 1st. That by steam pressure, which gives no certain indication whether strain has not taken place under its influence, so that a boiler tested may subsequently explode when worked at the same or even a somewhat less degree of pressure. He trusted that this highly reprehensible practice had been wholly abandoned. 2nd. That by hydraulic pressure obtained by a force pump, which does not afford an absolutely reliable proof that the boiler has passed the ordeal without injury, and moreover requires a special apparatus. The plan which had been adopted by the author for two years past with perfect success was free from the objections which applied to the above, and is as follows:—The boiler is entirely filled with water. Then a brisk fire is made in or under it. When the water has thereby been warmed a little, say to 70° or 90° Fahrenheit, the safety valve is loaded to the pressure up to which the boiler is to be tested. Bourdon's or other pressure indicator is then constantly observed; and if the pressure, occasioned by the expansion of the water, increases continuously up to the testing pressure without sudden stoppage or diminution, it may be safely inferred that the boiler has stood it without strain or incipient rupture.

In the trials made by the author, the pressure rose from zero to 62 lbs. on the square inch in five minutes. The facility of proving a boiler by this method was so great that he trusted that owners would be induced to make those periodical tests, without which fatal experience had shown that no boiler should be trusted.

Microscopical Section, Nov. 21st, 1859.—Messrs. J. Lynde and A. Brothers exhibited the process of photographing microscopic objects as used by them, and which, from the specimens produced, appears very excellent. Mr. Parry described a simple form of camera which he had used, and in which he dispensed altogether with the use of the microscopic body, simply inserting the object glass into the lens aperture, and fixing a suitable stage to support the object. Messrs. Lynde and Brothers stated their intention of attempting to photograph thicker and more opaque objects; and Mr. E. W. Binney promised to supply them with sections of fossil woods, which he said had been drawn by artists, but with poor success, as the tendency of draughtsmen was to make them too

sharp in outline, the objects losing their characteristic appearance by over definition.

ASSOCIATION OF FOREMAN ENGINEERS.

The ordinary monthly meeting of the Association of Foremen Engineers took place at their rooms in the City of London on Saturday night last, and was very numerously attended, notwithstanding the inclemency of the weather, and the fact that its members are located—many of them—at considerable distances from their very central place of assembly. The minutes of the November meeting were first read and confirmed, several elections followed, and after the reading of a letter from Colonel Dixon, of Enfield Lock, expressive of his high regard for the Association, and his regret at not being able to attend this particular meeting, Mr. C. F. Hayes proceeded with his concluding paper on the manufacture of the Enfield rifle. He said that he had on previous occasions endeavoured to explain the mode of preparing the various components and furniture of the long Enfield rifle and of the bayonet, and that he had now arrived at the lock and stock of the weapon. Upon the table lay the various parts of a rifle lock in the forged and finished stages, and a walnut-wood stock, as it left the machines which had shaped, mortised, drilled, and grooved it. These, together with some of the standard gauges used at the small-arms factory, and some exquisite photographs of the various machines at that place, assisted Mr. Hayes materially in his explanations. The hammer was the first item alluded to; this was of wrought-iron roughly forged by hand, and then struck by force of a Nasmyth steam drop into a pair of dies; afterwards it was annealed and forced through a cutting-press, which removed the superfluous metal squeezed out between the forging dies. A series of operations followed amounting in all to twenty-six, and in each of which great care had to be observed. The lock-plate was of wrought-iron. It was brought nearly to its proper form in a rider forging machine, and then struck at a welding heat into a die. Next, eight holes were drilled through it for the purpose of attaching to it the various pins, springs, &c., which go to make the lock complete. James Gunner, Esq., had greatly improved the apparatus used in shaping and finishing the lock-plate, and he very deservedly filled the post of inspector of small arms at Enfield. Very soon the lock-plate would be finished from the anvil without the intervention of hand labour at all. After case-hardening, the plate is tested by standard gauges, to be assured that there is no distortion, and, if found perfect, is ready for "assembling," that is, for being united with its fellow-portions of the rifle. The tumbler was a very important part of the lock, and was made of cast-steel. Much attention was requisite on the part of the workers in dealing with this, lest the heats taken upon it should alter and deteriorate the character of the metal used. Improved copying machines were now employed in the completion of this portion of the weapon, and after a variety of minor but yet consequential processes, it was finally hardened and tempered. Mr. Hayes here explained that the labour-saving machines invented by himself, and pertaining principally to the construction of the several parts of the lock, had saved from two to four thousand pounds per annum to the country—a rather important announcement. The sear and the sear spring were next referred to, and the manipulations necessary for their perfecting—minute and numerous—were explained with an elaborateness of detail which prevents our following the reader of the paper through his account of them. Finally, the sear spring is tested by pressure in a Saller's spring, and if found satisfactory, passed for service. The swivel is a small affair, but of some moment to the action of the lock. It is cut from a bar of 5-16th square steel, and after being milled, and faced, and drilled, and hardened, and tempered, it takes its place as a finished article. The bridle governs the movement of the lock, and is of great consequence, therefore, to the rifle. It is of wrought-iron got up by stamping, and milling, and cutting, and

trimming, which, aided by some excellent gauges devised by Mr. Barnes, enables the workman to turn it out of hand expeditiously and well. The *main-spring* was of the best cast-steel, and it was needless to say, observed Mr. Hayes, that the skilled workman must exercise his utmost skill and judgment in dealing with it. This brought the reader of the paper to the manufacture of the *stock* of the rifle, which was of walnut wood—a material imported largely from Lombardy for this particular work. Copying machines, the idea of which was no doubt gained originally from Mr. Blanchard's lathes for turning irregular figures in wood, such as boot trees, &c., &c., were the principal media employed in converting a roughly sawn piece of walnut tree into a handsome and mathematically true-shaped bearer of the barrel, lock, and other fittings of the rifle musket. Space forbids our going minutely, as Mr. Hayes did, into the action of the shaping and cutting machines used in the preparation of stocks for muskets; we can only say that they do their work with unerring accuracy, and that there is no chance of any portion of the steel, iron, or brass attachments *misfitting* their places after the machines have done their offices. The interesting paper was brought to a conclusion by a summary of the number of operations performed in the perfecting of a rifle musket being given, and these amount in all to 769! A vote of thanks, proposed by Mr. W. Keyte, seconded by Mr. Briggs, and strongly advocated by the President, Mr. Joseph Newton, of the Royal Mint, was next given to Mr. Hayes, who expressed his acknowledgement of the honour conferred. The announcement of a paper for the January meeting—Saturday the 7th proximo—by Mr. Beckley, on "The Instruments used at the Royal Observatory, Kew," closed the proceedings.

MEETINGS FOR THE ENSUING WEEK.

Mon.—London Inst., "On the Radiation and Absorption of Heat," by Prof. John Tyndall, F.R.S., at 7 p.m.

Royal Geographical Society, I., "Kashmir, on the Physical Configuration of the Valley of," by W. H. Purdon, Esq., F.R.G.S., Executive Engineer, Punjab, communicated by Sir Chas. Wood, India Office; II., "British Columbia, Journeys in the Districts bordering on the Thomson, Frazer, and Harrison Rivers," by Lieuts. Mayne, R.N., and Palmer, R.E., and Chief Justice M. Begbie, communicated by the Duke of Newcastle, Colonial Office, at 8.30 p.m.

Tues.—Inst. Civil Engineers, Annual General Meeting, at 8 p.m.

Wed.—London Inst., "On the Physical History, Structure, and Materials of the Earth," by E. W. Bradley, Esq., F.R.S., at 7 p.m.

Society of Arts, "On the Great Eastern," by Mr. William Hawes.

Royal Geological Society, I., "On some Bones of Polytrechodon, from the Chalk of Dorking," by Prof. Owen, F.G.S.; II., "On some new Reptilian Remains, with Shells of Pupa and an Iulus from the Coal-measures of Nova Scotia," by Dr. Dawson, F.G.S.; III., "On some Fossils from Bahia," by S. Allport, Esq.; IV., "On some Chelotherian Tracks in the Upper Keuper of Warwickshire," by the Rev. P. B. Brodie, F.G.S.

Thurs.—Royal Society, at 8 p.m.

Fri.—London Inst., "On Certain Principles of Vegetable and Animal Chemistry," by S. A. Malone, Esq., F.C.S., at 7 p.m.

Law Cases.

WILD'S PATENT FISHES FOR RAILWAY JOINTS.

COURT OF QUEEN'S BENCH, DEC. 3.—(Sitting at Nisi Prius, before Lord Chief Justice Cockburn and a Special Jury.)

HARWOOD AND OTHERS v. THE GREAT NORTHERN RAILWAY COMPANY.

Mr. Knowles, Q.C., Mr. Grove, Q.C., Mr. Hindmarch, and Mr. Webster appeared for the plaintiffs; and Mr. Bovill, Q.C., Mr. C. Pollock, and Mr. Horace Lloyd for the defendants. The trial of this cause, which has occupied the Court three days, was this day brought to a close.

The plaintiffs were the executors of the late Charles Heard Wild, and they sued the Great Northern Railway Company to recover damages for the infringement of a patent granted to Mr.

Wild on the 16th of March, 1853, for "improvements in fishes and fish joints for connecting the rails of railways." The action had been already once tried, when the defendants obtained a verdict, but the Court subsequently granted a new trial upon the ground of surprise. It appeared from Mr. Wild's provisional specification that his invention consisted in forming a recess or groove in one or both sides of each "fish," so as to reduce the quantity of metal at that, and be adapted to receive the square heads of the bolts, which were thus prevented from turning round when the nuts were being screwed on. In his specification subsequently filed on the 19th of September, 1853, Mr. Wild, after minutely describing the invention, stated its advantage to be that—"the groove renders the 'fish' lighter for equal strength, or stronger for an equal weight of metal, than a 'fish' which is made of equal thickness throughout." Having described the nature of his invention, and in what manner the same was to be performed, he claimed,—1. The constructing 'fishes' for connecting the rails of railways with a groove adapted for receiving the heads of the bolts or rivets employed for securing such fishes, and the application of such fishes for connecting the rails of railways in manner hereinbefore described. 2. The constructing fish-joints for connecting the rails of railways by means of fishes applied to the joints of divided or split rails, in manner hereinbefore described. 3. The constructing fish joints for connecting the rails of railways with fishes, secured by three or more bolts and nuts or rivets, of which the central bolt or bolts, or rivet or rivets, is or are of greater diameter than the extreme ones, as hereinbefore described. 4. The constructing fish-joints for connecting the rails of railways with grooved fishes fitted to the sides of the rails and secured to them by bolts and nuts or rivets, and having projecting wings firmly secured to and resting upon the sleepers or bearers, so as to support the rails by their sides and upper flanges, in manner hereinbefore described." A great many scientific witnesses were called on the part of the plaintiffs to prove the novelty of the invention. They admitted that grooves had been in use for the purpose of preventing the heads of bolts from turning round, but they denied that grooved iron or timber had ever been employed in the manner of a "fish" to unite two pieces of iron or timber. On the part of the defendants, several scientific witnesses were called, who gave contrary testimony, and the model of a bridge, called the Hackney-bridge, on the South Devon Railway, was produced, in which they said a grooved or channelled iron was used as a "fish" to strengthen and support a scarf-joint in the tie-beam. The plaintiff's witnesses denied that the channelled iron in question was so used, and thus the question at issue resolved itself chiefly into an inquiry as to the precise functions performed by the channelled iron in the Hackney-bridge.

The jury found that channelled iron for strengthening, and also for keeping in place bolt heads, was in use before the patent, but that the combination in Mr. Brunel's bridges was accidental, and they did not deem it "fishing."

The Lord Chief Justice said that would be a verdict for the plaintiffs, with leave to the defendants to move to enter the verdict in their favour, should the court above be of opinion that the transfer, as it might be called, to "fishing," and the combination therewith, would not support the patent.

Verdict for the plaintiffs accordingly.

COURT OF QUEEN'S BENCH, DEC. 6.—(Sittings at Nisi Prius, before Lord Chief Justice Cockburn and a Common Jury.)

BECKFORD AND ANOTHER v. THE ROYAL MAIL STEAM-PACKET COMPANY.

Mr. Serjeant Petersdorff and Mr. Webster appeared for the plaintiffs, and Mr. Wilde and Mr. Murray for the defendants.

This case (involving a question whether Messrs. Miller, of Glasgow, had infringed "Westwood's patent for protecting the iron of ships against cor-

rosion," by using a mixture, before applying asphalt, not distinguishable from what is known commercially and scientifically as "black varnish") was brought to a conclusion this morning. The mixture was applied to two of the company's vessels, and they defended the action under an indemnity from Messrs. Miller.

The jury found their verdict for the plaintiffs—Damages £150.

CROSSLEY'S PATENT JACQUARD MACHINERY FOR WEAVING CARPETS.

COURT OF QUEEN'S BENCH, DEC. 5.—(Sitting at Nisi Prius before Lord Chief Justice Cockburn and a special Jury.)

CROSSLEY AND OTHERS, v. TALBOT.

Mr. Atherton, Mr. Grove, Mr. M. Smith and Mr. Webster appeared for the plaintiffs; Mr. Knowles, Mr. Hindmarch, and Mr. Thruff for the defendant. The action resulted in a verdict for the plaintiff (without the case being gone into at length) with the damages (£2000) in the declaration subject to a reference.

PRESS'S IMPROVED QUICK ACTION DRILL STOCK.

Provisionally Registered June 30th, 1856.

This improved drill stock will drill holes in metals and other substances with greater ease and rapidity than is attainable by the use of any description of drill stock hitherto made; so, at least, says the inventor of it.

In the drawing *A A*, *A' A'* is the frame of the

drill stock; *a a* is the spindle carrying the drill *D*. Each end of the spindle *a a* has a spiral external thread, as shown at *E E*. On the frame are fixed two small pulleys *F*; a handle *G* is attached to that part of the frame marked *A' A'*, so that it may slide from end to end upon it. To the inner side of the handle is fastened a gut or string marked *b*, which passes over the pulleys, and from thence around the spiral threads, where its ends are fastened. By working the handle *G* from end to end on that part of the frame marked *A' A'*, a very quick motion is imparted to the spindle and drill by means of the gut or string passing over the pulleys and in the grooves or spiral guides, which may be large or small in diameter according to the kind of work for which they may be required.

BLACKBURN'S PATENT TRACTION ENGINE.

THE Smithfield Club Cattle Show and Implement Exhibition of 1858 were open to the public, when we promised to publish a description of the patent traction engine of Messrs. Isaac and Robert Blackburn, of Long Eaton; but the Smithfield Show and Exhibition of 1859 have come round before the promise has been fulfilled. The cause of the delay is to be found in the fact that after our announcement was made last year, we learnt that Messrs. Blackburn had under consideration several important improvements upon the engine, and it was not until recently that these improvements were perfected. We are now enabled to lay before our readers careful engravings of the finished engine in its most improved form, and we hope shortly to give a detailed account of its operation on the road and in the field.

Fig. 1 of the accompanying engravings is a side elevation, and Fig. 2 is a plan of a locomotive or traction engine constructed according to Messrs. Blackburn's invention. *A A* is the large travelling drum, which is connected to trunnions *A' A'*;

BLACKBURN'S PATENT TRACTION ENGINE.

FIG. 1.

FIG. 2.

means of arms or spokes *BB* meeting in central bosses *B' B'* through which the trunnions *A' A'* pass. The extremities *a' a'* of the trunnions pass through and support the frames *CC*, to which are firmly secured the longitudinal beams *C' C'* which the engine rests. The beams *C' C'* are strengthened with iron plates, and the drum *A* is strengthened by the T rings *E E*, which pass directly round it. The boiler *E'* is supported by the inner ends of the trunnions, as shown in Fig. 2. The surface of the drum is composed of corrugated metal plates *DD*, the spaces formed by the corrugations being filled in by timber, *GG*, in order to strengthen the metal corrugations, and prevent them from collapsing; *HH* are bevelled wheels bolted on the exterior iron ring of the drum, into which toothed wheels bevel pinions *II* gear, which cause the drum to revolve, will be hereafter described. *E'* is a boiler which is supported upon the trunnions *A' A'* in the middle of the frame; *K* is a pipe by which steam is let through the trunnions *A'* to the cylinders

II of the engines; *MM* are the piston-rods, which are jointed to the cranks *NN* that drive the main shaft *O*, which carries at its ends bevel wheels *PP*, that gear into the bevel wheels *QQ'*, which communicate rotary motion to the bevel pinions *II*, which gear into the toothed wheel attached to the travelling drum, and so cause it to revolve; *RR* are clutches provided with hand levers *R' R'* for throwing the pinions *II* in and out of gear, in order that the engine may be employed for other purposes than driving the drum; *S* is a pipe leading to a gauge *S'* for indicating the height of the water in the boiler *E'*; *T* is a foot plate or platform, which is supported by the main frame *C* and the guide wheel *U*. In addition to this guide wheel they use a roller or cylinder when travelling over soft land. This guide wheel is connected by a frame *U'* with a vertical shaft that carries a cog-wheel *V* into which a pinion *W* gears. This pinion is attached to a vertical shaft *X*, which carries a hand wheel *Y*, by which the whole machine is guided. The boiler *E'* is sup-

plied with water through the trunnion *A'*, opposite to that which supplies the cylinders with steam; *Z* is a water-tank which receives the steam from the exhaust, and contains a supply of water for the boiler; *Z'* is a coupling chain for connecting implements of culture or other apparatuses to the engine.

As an implement of culture the patentees employ a cylinder fitted with scarifying or digging tines, which cylinder is fitted to the afterpart of the engine, and is caused to revolve by teeth formed on or attached to its sides, into which teeth pinions gear, receiving motion from the travelling drum of the engine. The depth at which the tines work in the ground can be regulated at will, and arrangements are provided for raising the cylinder wholly out of the ground.

The submarine telegraph between Victoria and Tasmania has been successfully submerged, and Hobart Town is now in direct telegraphic communication with the other colonies.

ON HEAT.

EXPERIMENTS AND OBSERVATIONS TENDING TO PROVE THAT THE HEAT WHICH DR. BLACK DISCOVERED TO BE ABSORBED DURING THE LIQUEFACTION OF ICE, AND WHICH HE CALLED LATENT HEAT, IS NEVER GIVEN OUT AGAIN ON THE FREEZING OF WATER, WITH REMARKS ON A PECULIAR PROPERTY WHICH SEEMS TO BE DEVELOPED IN WATER AND MANY OTHER FORMS OF MATTER ON CHANGE OF STATE.

By HORATIO PRATER, Esq.

I HAVE repeated the experiment three times of mixing two parts by measure of snow and one part of water at 172° F., and I never found the thermometer fell lower than 36° (even when I diminished this water to $\frac{1}{4}$ part), and before it fell thus low twelve minutes had elapsed, and the snow was then only just melted. The almost sudden fall to 32° F. which some experimentalists speak of to prove a loss of 140° in this experiment, doubtless arises from the difficulty there is to prevent the actual contact of snow or ice with the bulb of the thermometer. To prevent this I tied two folds of fine linen round it; and even then we must remember that a stream of very cold water will be apt sooner or later to flow directly on it, since the snow is constantly moving in the water. However, in my experiments the whole bulk of the water certainly (sooner or later, according to the temperature of the room) fell to 36° , and as the temperature of the room was as high as 58° , this may probably be the reason—allowing for difference in thermometers, and adding, perhaps, the fact that I used snow and not ice—why it never fell to 32° , as in Dr. Black's experiments. He took equal weights of water and ice, but as I found snow thaws into between $\frac{1}{16}$ and $\frac{1}{8}$ its bulk of water, I took an overweight of snow. I found the very sudden fall to be to about 44° ; in seven minutes more it stood at 38° , at which time the snow was not quite melted; and in ten minutes more at 36° , when the snow was only just melted. The long time (viz., on an average twenty minutes) that snow in the above proportion took to melt in water at 172° , is worthy of remark, and proves Thomson's statement (*On Heat*, p. 163), that "snow instantly melts" in such circumstances, to be erroneous.*

When I mixed equal bulks of water at 32° and at 172° , the point to which the thermometer came suddenly was 110° ; it then continued to sink, but very gradually, for even after 45 min. it stood at 70° , the room being 66° as in the former experiments. When I took two bulks of this ice water and one of water at 172° , in three minutes it stood at 78° , and then very gradually (viz., in four minutes) fell to 70° , and in eight minutes more to 70° , and there remained, as in the former experiment, a long time.

These experiments sufficiently confirm Dr. Black's great discovery, viz., that an equal proportion of ice, or snow, mixed with water at 172° makes the thermometer fall far lower than when mixed with water at 32° . That in my experiments it never fell below 36° is a difference too light to merit attention.

I found that snow water at 32° took 57 minutes to gain 12° of heat, and still continued to rise very slowly, the temperature of the air being 48° .

In 34 minutes it rose from 32° to 36° , in 23 minutes more (total 57 minutes) to 44° , and did not rise to 46° for nearly two hours.

The very slow rise of the thermometer depended on the external air being only 48° , but the same quantity of snow would doubtless have taken very far longer to melt and rise at the same point; though at the same temperature I observed that a piece of snow of about the size of a small

* Professor Thomson often speaks of the slowness with which ice melts, and attributes it to the necessity for absorbing 140° , but I believe the real cause to be (and this cause applies equally to the slow melting of snow in water at 172°) that heat has not merely to be absorbed, but the conversion of the ice or snow has also to be overcome, for we know that ice can't remain ice, and absorb heat above 32° . If it could, these 140° could be absorbed as quickly in this case as in many others.

cherry took only thirty minutes to melt. Larger masses of snow (if round) take far longer, because the heat of the external air cannot come in contact with the centre portions.

In confirmation of Black's theory of the great degree of heat absorbed by the liquefaction of ice, I may also state that when I mixed intimately two tea-spoonfuls of snow with one ditto of muriate of soda, the temperature very soon sunk to 4° , (an experiment well known—Thomson, p. 169, says it sinks to 5° .) But in 45 minutes it rose again to 33° . Although in this experiment nearly $\frac{1}{3}$ rd of the mass remains solid as muriate of soda, yet enough liquid is produced rapidly in order to produce cold of 4° below zero, and hence Thomson (op. cit. p. 172) says, "snow and chloride of calcium which liquify immediately on mixture, produce a much greater cold (viz., from $+32^{\circ}$ to -50°), than snow and salt, which liquify very slowly." "Very slowly," perhaps, when taken and compared with chloride of calcium, but taken by themselves I thought they liquified quickly. While I admit, therefore, that Thomson's explanation is right as regards the main point (viz., rapidity of liquefaction), I am inclined to think that other causes also assist in causing so vast an increase of cold in one of these cases beyond the other.*

That sudden liquefaction is the main cause is, however, shown by mixing a teaspoonful of snow water at 32° and one of salt, when I found the thermometer remained without falling at all, and was not long in rising even to 36° ; the temperature of the air in these experiments being, as above, 48° —a point to be attended to, says Thomson (note p. 168). I am inclined to draw the following inferences (in addition to Black's inference) from this experiment with snow water at 32° , which I believe has never been tried before. This inference is, that some of the effect depends not only on rapid liquefaction (strictly so called), but also on the sudden production of a *nîsus*, or power of resistance, from the, so to call it, unnatural state in which snow is thrown when mixed with salt or chloride of calcium, and also in the former experiments when mixed with water at 172° . Even Thomson himself has unconsciously introduced a *physiological cause*, in addition to Black's mere *mechanical* theory of 140° , into this discussion, when he is obliged to admit RAPIDITY OF ACTION counts for so much; for it makes one 140° more than another 140° when the action is quicker.

Again, is not the production of cold in this case (though in others of heat) in overcoming the compression of ice entirely overlooked in Black's theory? Is not this cold produced on the spot—"then and there"—by this struggle of ice to retain unmolested its state of ice? Accordingly when water at 32° is substituted, we find (strange to say) that no cold whatever is produced—clear proof that at least, in the case of salt, Thomson's theory of the solid water of crystallisation absorbing 140° in order to become water (and thus causing cold) does not hold. He gives (p. 172) this as the theory for the production of a cold of 49.5° (viz., from 54.5° to 5°) when 500 grains sulphuric acid are mixed with 333 grains water, the mixture allowed to cool, and then 10.40 grains of crystallised sulphate soda finely powdered put in. Again, says he, "Chloride of calcium in crystals contains more than half its weight of solid water," in reference to the cold of 82° produced when this salt is mixed with snow.

Now, in reference to these experiments of Bischof and Walker, who assert the cold is not produced except the salts contain their water of crystallisation, we are hence clearly obliged to admit that this is concerned in the effect; but

* The reason why the thermometer falls to -4° or -5° in this experiment, and when ice is simply melting remains at 32° , is no doubt to be ascribed to an excess of cold produced above the 140° which Black rightly inferred do not affect the thermometer, because they combine with the water formed. But in the snow and salt experiment not only are the 140° absorbed, but as they also must be insensible to the thermometer, the fall to -5° must be caused by an extra portion of heat to that extent absorbed from surrounding bodies, which not being able also to combine with the water and salt, thus becomes sensible to the thermometer.

that it does not act solely in the mechanical way supposed by Thomson is proved, I think, by the cold produced in many of these cases being far greater than is necessary to form ice. In many of these cases there is clearly a production of cold far beyond what this latent heat theory of 140° can account for, and that, too, when no snow or ice at all is used; for when phosphate of soda, nitrate of ammonia, and diluted nitric acid are used (proportions, 9, 6, 4) a cold of 71° is produced within a few degrees of that produced by snow and muriate of lime. Now, here is cold produced far greater than when water gives out, according to the prevailing theory, its 140° and becomes snow and ice, and that, too, without any assistance from snow or ice!

A point worthy of remark is that the cold produced is very transient. Thus, in my experiment with snow and salt, I think it may be said to have lasted only while liquefaction and the peculiar motion accompanying this was going on, for in 45 minutes the thermometer rose actually as high as 48° . The secret of the production of cold, even in this case far beyond what the absorption of 140° can account for, is, I believe, to be ascribed to the NATURAL action of liquefaction being interfered with, and to its being MUCH HURRIED by the addition of the salt.*

In the great proportion of frigorific mixtures two crystallised soluble salts are used; but that chemical affinity is little concerned in the effect is shown by the solution of one salt only in simple water producing much cold. Thus, for instance, nitrate of ammonia and water lowers temperature from $+50^{\circ}$ to $+4^{\circ}$. (Thomson, p. 168.) Now, I infer from this fact, and others above quoted, that the supposed conversion to water of the solid water of crystallisation and the necessary absorption of 140° , does not explain the production of this very great degree of cold, and consequently I infer that this is produced by the RAPID SEPARATION of the atoms of matter by solution. In this way heat is absorbed, and consequently cold produced by the *nîsus* of the atoms of matter to REGAIN the quantity of heat by which they are naturally surrounded or with which they are combined. That this is the true theory seems to me to follow from reflecting that the COMPRESSION of homogeneous atoms together (as in the compression of air) produces heat; as also of heterogeneous atoms by the action of chemical affinity; thus when oxide of zinc, &c., is formed by the action of dilute sulphuric acid, or when iron wire burns in oxygen gas and produces the oxide. Thus, compression and chemical affinity act in the same way in regard to their tendency to force the atoms closer together.

(To be continued.)

OPENING OF THE VICTORIA-BRIDGE, CANADA.

ALL Canada was rejoicing on Thursday, the 24th of November last, as the great Victoria Tubular-bridge, the most stupendous work of the kind in the world, and the connecting link between two important sections of the Grand Trunk Railway, was being opened on that day. The first train consisted of an engine and single car, containing about 50 persons. The time occupied in passing

* While I assert this, I by no means wish to deny that this "hurried action" does not act mechanically by causing such a sudden loss of heat that air, &c. (though at 50° or more) cannot restore it with sufficient rapidity to prevent a great fall in the thermometer. Thus, says Thomson, "Mercury may be frozen even in a warm room" by snow and chloride of calcium, and water may be frozen in a red-hot crucible, as Boutigny has shown, by anhydrous sulphurous acid. (*Etudes*, &c., &c., 3ieme. edition, 1857.) It is clear that these and other marvellous facts stated in the volume just quoted, depend more or less on the fact that heat, left to itself undisturbed, moves much less quickly than electricity, and always requires a certain amount of time to establish its equilibrium. The long time the thermometer often takes to rise or fall shows the truth of this statement; but it is not easy to believe this at first, as we are generally accustomed to observe heat when circumstances oblige it to move very quickly.

I may here add that another grand distinction between heat and electricity is, that the former seems to be able to move through all kinds of matter, though through some with difficulty, including even ice (a non-conductor of electricity), as Tyndall's late experiments show, also Melloni's (see his tables, *Ann-de Chim et Phys.*, Tom. 55).

was about 12 minutes and a-half. Among the gentlemen in the car were the Hon. Mr. Cartier, Premier; Mr. M. Ross, chief engineer of the bridge; Mr. Blackwell, managing director, and several directors of the Grand Trunk road. Two of the tubes are not quite finished, but the bridge is expected to be fully completed and thrown open to traffic about the 15th inst. This will be exceedingly opportune for the trade of Canada, which is expected to derive a renewed impulse, as the water navigation has ceased. The traffic over the line is steadily increasing. The receipts for the week preceding the opening to Detroit, which took place on the 21st ult., amounted to 60,560 dols., being 10,000 above the receipts of the corresponding period of last year. The prospects of through Western freight are very good.

LIGHT WOODS AND UNSINKABLE SHIPS.

THE following letter from Captain J. H. Selwyn, R.N., is accompanied by a specimen of extremely light wood. It is in the form of a short cylinder, 3½ ins. in diameter, of a mean thickness of 1½ ins., and weighs 323 grains. It would no doubt absorb a considerable weight of water, (as Captain Selwyn suggests,) but as we purpose sending the specimen to the Society of Arts we will not venture to test its absorbent qualities:—

GENTLEMEN,—I send you a specimen of light wood, which may afterwards, if you please, go to the Society of Arts. It is probably the same as that sent by Mr. Cunningham. I brought it from Brazil; it is the stem of the great flowering South American aloe, not a cactus. I do not think any of the cacti have any such wood. But light woods approaching this specific gravity, but of large size, are well known both in America and Africa, and are in America used for making Balsas or navigable rafts, while in Africa they are principally used for floating the heavier woods down the rivers. I do not, however, think that any such means can ever be useful for making unsinkable ships, for the space occupied must always be so comparatively great as to exclude any useful cargo, and all such bodies have the fault of rapidly absorbing water, and then of course losing their floatative qualities until again dried. Balsas or catamarans are always hauled up on the beach to dry after their short voyages. I think that more than anything else speed and bottom, i.e., economy of fuel, will decide the future naval engagements, at least as regards the material, and invulnerability or unsinkability are alike opposed to both of these, the one by increasing the weight, the other by decreasing the space available for fuel. J. H. SELWYN.

UNSINKABLE SHIPS.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."
Woolwich Dockyard, Dec. 6th, 1859.

GENTLEMEN,—I am glad to observe that the suggested idea "unsinkable ships" is attracting the attention of your readers, whose remarks hold out the expectation that the subject will be thoroughly discussed. I am, however, not disposed to notice much of the banter with which it seems that the suggestion of original views on matters connected with practical science must be expected to be publicly received. In starting the idea of constructing ships so as to be unsinkable, I made no profession of having matured the details of such a project, for, first of all, the materials most advantageous for the purpose had to be determined, also the practical mode of applying them, which would greatly depend on the nature of the materials themselves; and ultimately the extent and varieties of application to which the principle can be beneficially adapted depends on considerations which, perhaps, no one individual is competent fully to appreciate; and all these contingencies are mutually dependent on each other. In the case now in question, it was the opening up of the Australian gold-fields that originated in my mind the idea of "unsinkable treasure ships," for which purpose a mass of material built together

solid, or if not suitable for being built together, filling up the compartments of a cellular construction so as to form a solid floating mass up to or a little above the load line of the vessel—such mass as respects its form and stability being, of course, constructed in accordance with the essential elements of naval architecture—would, I dare say, form a suitable bottom for such purpose. The treasure might be duly secured or embedded therein, and suitable accommodation for the crew would form the superstructure of the hull. Such was the original idea, and incidental circumstances, such as the supposed irresistible force and precision of modern ordnance, and the threatened introduction of the marine ram, gave rise to the suggested application of the system to ships generally. Every case of special application will, of course, demand special adaptation of practical details, the general result being that the aggregate mass of material, when immersed in water, shall not merely float itself, but be capable of supporting, in addition to its own weight, the load that may be imposed on the ship. The distribution of the material for giving the floating power will be a matter of arrangement in which great ingenuity may be displayed, and all the elemental principles of naval architecture will be called into requisition in the construction of "unsinkable ships," as is now the case in the construction of floating vessels generally.—I am, Gentlemen,

Yours very obediently,

CHAS. ATHERTON.

THE LOSS OF THE ROYAL CHARTER.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—The inquiry into the loss of the Royal Charter having been closed, I beg to offer a few remarks, which you may perhaps deem not altogether useless on that unfortunate accident.

It seems extraordinary that no reason is shown by the evidence why the operation of wearing did not succeed. "Wearing" (I may say, for the benefit of your non-nautical readers) consists in the turning of the ship's head from the wind in order to gain the opposite tack, as "tacking" or "staying" is the turning of her head towards the wind with a similar object.

The Royal Charter, according to the evidence, had not for some time been able to keep to the wind, i.e., within six points, even with the helm hard a starboard. Tacking, therefore, would seem to have been out of the question. It was, however, tried but failed. But wearing ought, one would think, to have succeeded, and why it did not is the mystery, more particularly if the means were adopted to which I shall now refer. Admiral Paris, of the French navy, has recently spoken of some phenomena in the manœuvring of steamers, which, I trust, are not unfamiliar to many of my brother officers. I do not think he notices the one which is applicable to this case. If in a heavy gale, the ship being on the port tack, with but little sail possible to be set (say a fore-trysail or staysail), it be desired to wear, the screw, particularly if auxiliary, may be thus applied, bracing the yards, &c., as usual. From going a-head reverse and go astern easy, as quick as you can, the helm to be put very slightly to starboard. The ship's head will fall off quickly, because the screw gathers to port before it can act to force the ship astern. As soon as the wind is aft go ahead again. This can, of course, only be done (with a right-handed screw) if on the port tack, as the action is entirely caused by the differing immersion of the two blades, and the consequently differing force exerted by them; you will by this means, if skilfully done, lose but little if any more ground than if you had tacked, which is sometimes impracticable under such circumstances, and always uncertain.

A curious and, I believe, hitherto unaccounted fact connected with paddle steamers is, that if you go astern, they will always turn their sterns towards the wind, as well where the paddles are in the middle as when they are nearest the bow.

J. H. SELWYN.

STEAM-SHIP ECONOMY.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."
Woolwich Dockyard, 7th Dec., 1859.

GENTLEMEN,—It is rather a trial of one's patience to have to repeat explanations in matters of theoretical investigation. But in courtesy to correspondents those who court public investigation in such matters must, it seems, frequently submit to such necessity; there is some satisfaction, however, in the fact that every such repetition in a public journal such as the MECHANICS' MAGAZINE attracts fresh inquiries towards the subject in discussion. With reference, therefore, to Mr. Cheverton's remarks in your last number (No. 49) on the construction and application of the formula

$$\frac{V^3 D^3}{\text{Ind. h. p.}} = C, \text{ I beg to repeat that in the}$$

calculation by this formula of the mutual relation of displacement, power, and speed of vessels of different sizes represented by their respective displacements, the coefficient (C) after having been practically ascertained for one vessel of the type under consideration, is assumed to be a constant number only for vessels of that particular type of immersed form, and in which the ratio of gross indicated h. p. to the effective working power is also assumed to be a constant number, or closely approximate thereto; also it is assumed that all other circumstances affecting the performance of the vessels are under similar conditions as usually implied by the term *ceteris paribus*. It is therefore only on the assumption of the co-efficient corresponding to the type that may be under consideration being known or approximately so, that any pretension is made to the mutual relations of displacement, power, and speed being determinable by this formula, that is, for either one of those elements being determinable the other two being given. It is also to be observed that two different types of steam-ship construction may possibly give the same co-efficient, that this can only be regarded as a coincidence in exception to the general rule.

Presuming on these theoretical properties of the formula being confirmed by experience and conceded, it follows that the different co-efficients respectively distinctive of different types of steam-ship construction indicate the order of merit with reference to the mutual relations of displacement, power, and speed, in which the dynamic performance of vessels of different types may be rated or classified, and if instead of the indicated h. p. as the denominator in the formula, we adopt as its representative the consumption of coals per hour (W), the comparative co-efficient resulting from this formula will in like manner indicate the order of merit with reference to the dynamic duty capable of being performed by the respective ships thus tested in comparison with each other.

I am, Gentlemen, your very obedient servant,
CHAS. ATHERTON.

METEOROLOGICAL TELEGRAPHY.

A TALENTED author in one of his works on nautical science intimates that the electric telegraph might be advantageously used for the purpose of conveying notice of approaching storms. This novel application of meteorological science may be appropriately termed "meteorological telegraphy," and I ventured to suggest to the Aberdeen Session of the "British Association for Advancement of Science" that they should appoint a special committee to consider and report upon some uniform plan for ascertaining the nature, force, and direction of sudden weather changes, and flashing warning telegrams, in such effective manner as to result in the saving of many lives and much property annually, especially by prevention of wrecks in our channels, and on the coasts. The proposition was submitted to the committee of the section of mathematical and physical science, and upon their favourable report the general committee of the Association passed a resolution recommending "application to the Board of Trade for such an arrangement as may further this object authoritatively." Illustrations and arguments in support

of such a system would be tedious and unnecessary in the columns of a newspaper. It may suffice to state, that the chief means of attaining the desired purpose would be the establishment of barometrical stations in salient or extreme positions on our coasts, coterminous with the respective points of the compass, whence prevalent storm-winds blow, and thence telegraphing warning communications to distant shores or seaports. We possess the knowledge and instrumentality, and the practical adaptation of the latter would be both easy and inexpensive.

This subject, with its associate themes, is fraught with numerous considerations of incalculable importance for all maritime States, more especially for the British Islands, whose watery highways are quick with human life, and crowded with laden ships, ever intercrossing day and night, in light or darkness, storm or fog. The perils of sea-transit far exceed those of land, and yet how much more carefully are the latter guarded against by preventive arrangements! Why should not all our frequented channel tracts, and even great ocean routes to (say) forty miles distance from the principal ports, be indicated at certain intervals by conspicuous buoys, or even by anchored vessels, displaying characteristic symbols of position and contiguity to coast or haven. Apart from the inestimable value of human life, the cost would probably not amount to a moiety of the value of property destroyed by wreck within a period of five years; and as for the asserted impracticability of mooring ships securely in blue water, the genius of invention would soon overcome that difficulty. Once the benefit of an object confessed, and fitness of the means of attainment duly estimated, the true born son of science instantly sets to work to accomplish it, without even a doubt. Imagination conceives the project, science brings forth the completed labour, and THEN the halting advocate of mere practice and precedent wonders and admires; and it may be, in happy forgetfulness of his former incredulous prejudices, congratulates himself, as if he also were a co-worker in the progressive achievements of inventive science.

An extended publicity is respectfully solicited for these brief remarks, with the hope of attracting thoughtful and benevolent minds to a speedier solution of the important question submitted—namely, the prevention of loss of life, time, and property by storms, especially in the channels, and on the shores of the British Islands.

JOHN LOCKE.

Rathmines, Dublin, Nov. 1859.

LIGHTING MINES.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—I see that a paper is to be read this week before the Society of Arts, on the subject of accidents in coal mines. Now, as one of the greatest causes of accidents is the explosion of fire-damp, in which, by the carelessness of one individual, the lives of hundreds may be sacrificed, I venture to suggest that for the purpose of illumination, the electric light should be employed. Electric lamps might be hermetically sealed up in glass globes, and stationed in the various branches of the workings, and by means of suitable reflectors the light might be carried into almost any direction. If desirable the lamps might be made to some extent moveable, being fixed on a pedestal, and connected with the battery by insulated conductors; and if suspended aloft they might be made to illumine a large area at once. I know that economists would object that the arrangement would involve considerable expense, but the attainment of perfect safety would more than repay the extra expense (if it existed), while the miner who felt himself free from danger and under the influence of a genial light, would both be happier in mind, more comfortable in body, and would do double the work which he did before, while groping under the dim rays of his present safety lamp.

I have the honour to remain, Gentlemen,

Your most obedient servant,

F. MAXWELL-LYDE.

Duques de Digoire, 29th Nov., 1859.

RAILWAY SIGNALS AND WAR APPLIANCES.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—I made the following practical demonstrations of my appliances for war and home defence this day at Beaufort-house, Walham-green, in presence of Lord Ranelagh, his corps of volunteer rifles, and a numerous party of ladies and gentlemen amateurs.

No. 1 in the catalogue—A railway guard and passenger explosive signal to slide down a tube in a railway carriage on the iron rail, by which it explodes by percussion with a report much louder than a fog-signal such as is now in use.

No. 2—A grenade fired by friction, at about seven feet from the ground, by the check of a cord reaching to that height from an upper window. This grenade was thrown out of an upper window of Beaufort-house by a young gentleman of about the age of 15. It can be used in perfect safety by ladies in defence of "home, sweet home," thus "placing the weak on a par with the strong."

No. 3—Rifle fire-shot or spinster. This missile is far more efficient than the rifle percussion-shell for blowing up ammunition waggon.

No. 4—A safe way of fixing percussion appliances in the mouth of elongated rifle-shells for rifled cannon. This is done by inserting the appliance about a quarter of an inch below the mouth of the shell. The ramrod cannot then press on it, and if the shell should fall from the hands on the ground or the deck of a man-of-war percussion-end foremost, it is still safe; but by striking an object with great force when discharged from a rifled gun, it cuts out its own plug, which explodes it. Lord Ranelagh fired two elongated wooden shells from a large rifle into a heap of loose sand, where they instantly exploded, proving that iron shells on a similar construction can be employed from rifled cannon to destroy clay defences, on which mere shot have little effect.

No. 5—Gossamer cartridges. Lord Ranelagh fired several of these from a dragoon's pistol of the Enfield bore, and similarly rifled, showing how rapidly and efficiently they can be used in loading. They do not require to be broken or opened previous to insertion, as the military cap fires them to a certainty, provided the upper part of the nipple is countersunk so as to take in the whole fire of the cap. The cartridges were charged with Curtis and Harvey's improved coarse-grain gunpowder, No. 3.

I am, Gentlemen, yours, &c.

J. NORTON.

Rosherville, Dec. 3.

DEATH OF MR. JOHN FINCHAM.

THE death of this gentleman took place at his residence at Highland-lodge, Landport, near Portsmouth, on Tuesday morning, in his 75th year. The deceased will be best remembered by the general public as for many years master shipwright of Portsmouth Dockyard, and more especially as the builder of the *Arrogant*, the first screw frigate possessed by this country. Much of his time and study was devoted to the introduction of the screw propeller into the British navy. For a long period he was shipbuilding superintendent of the School of Naval Architecture at Portsmouth, and in later years had nominal charge of the practical part of the studies at the School of Mathematics and Naval Construction. His *History of Naval Architecture*, *Outlines of Shipbuilding*, a *Treatise on Laying-off Ships*, and on *Masting Ships*, are well known among professional men. As an acknowledgment of their merits the Emperor Nicholas, of Russia, presented Mr. Fincham with a snuff-box set with diamonds, and Mehemet Ali presented him with the order of the "Bey." Mr. Fincham was greatly indebted to others for assistance in the preparation of these volumes, and in the construction of the ships which were designed by him. His connection with the late School of Naval Construction resulted unhappily—the members of it attributing to him the chief cause of their undue depreciation. Mr. Fincham long since, we regret to say, lost

nearly all physical and mental energy, and his decease has for some time been apprehended by his relatives. He leaves behind him a son to succeed him in his profession—Mr. John Fincham, first assistant master shipwright of Chatham Dockyard, who will without doubt attain ere long the post of master shipwright in the service—the highest to which his father rose. It is only due to the late Mr. Fincham to say that for many years he received successive proofs of the high esteem in which the Admiralty held him.

NOTICES.

The *MECHANICS' MAGAZINE* will be sent free by post to all subscribers of £1 1s. 8d., annually, payable in advance. Post Office Orders to be made payable to R. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements. To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

Our Weekly Gossip.

DURING the recent trials at Shoeburyness of the 12-pounder Armstrong guns intended for China, another of the breech pieces was blown from the gun and fell about two hundred yards in the rear of the battery. This shows the extreme necessity for the utmost caution in the manufacture and use of guns upon this principle; and it becomes a grave question whether in the heat of action occurrences of a similar description may not readily take place, and thereby render the gun *hors de combat*, with the probable sacrifice of many valuable lives.

Inquests, Board of Trade inquiries, Committees of Investigation, and other like machinery, are of exceedingly little use to us in this country. The explosion of the *Great Eastern* ended in a wrangle before a country jury, who read newspapers while directors and contractors lied (some of them) and quarrelled. The loss of the *Royal Charter* has had a result less disgraceful but equally useless. Mr. Mansfield, the magistrate at Liverpool, and Captain Harris, the nautical assessor, have inquired into the latter melancholy event, and their report to the Board of Trade is before us. They tell us that a portion of the iron of which the *Royal Charter* was built, recovered with great difficulty and expense from the wreck, has been produced before, and tested by, the Liverpool corporation machine. "It is decidedly above the average strength of iron plating used for shipbuilding, and the average strength assigned by Mr. Fairbairn for good Staffordshire plate." Again we read, "from the evidence, I have arrived at the conclusion that the *Royal Charter* was, at the least, fully equal in strength to the average of ships of her class built at the same date (1855). Whether this be sufficient is a question which in reality does not arise in the present inquiry. Even if it did, I should hesitate to generalise from an isolated instance, on very imperfect evidence, and where so much is left to conjecture. A much wider induction is necessarily applied to the subject by underwriters in the ordinary course of their business; and to those of the public who may be ignorant of the fact it may be of interest to learn that, *ceteris paribus*, there is no difference in the premium paid for insuring wooden or iron vessels of the same class." Mr. Mansfield and Captain Harris also think that the ship was not properly prepared (by making her snug aloft) for encountering the rising gales—that (as we pointed out weeks ago) the Captain should have either run into Holyhead or kept the open Channel behind him—and that her masts were not cut away soon enough. They likewise point out the danger of steaming ahead while at anchor in a gale. A gale of wind is not uniform in strength, there are moments of comparative lull. During these the steam power not being readily controlled is apt to shoot the ship ahead. After this, when a violent gust occurs, the ship drops astern, bringing up with a sudden and a severe jerk on her cables—a kind of strain most likely to make them part. The cables of the *Royal Charter* were full 2½ ins. in diameter, and were tested by the maker, Mr. Woods, of Chester, to 72 tons. It is reasonable to suppose that the material and workmanship were

good. We need hardly say how little is to be found in all this to satisfy the public mind. If we are to draw inferences from this report, they can only be, that the Royal Charter was a very good iron ship, and that any other such ship would have gone to ruin as speedily and utterly as she did, after once coming upon the rocks. Comforting assurance!

The action which Messrs. Mears commenced against Mr. Denison for his statements respecting the bell, Big Ben, cast by them, was entered for trial for the sittings after Michaelmas Term in London, and would have been tried by Lord Chief Justice Cockburn, and a special jury. Mr. Denison pleaded a justification to the libel with which he was charged. The case was, however, withdrawn on Wednesday last, Mr. Denison having abandoned his defence. The plaintiff will therefore take a judgment by default. The only matter remaining to be determined is the amount of damages, which, in the usual course, will have to be assessed in the Sheriffs' Court.

Mr. Walesby sends the following practical suggestion:—

GENTLEMEN:—On Saturday last I heard Big Ben perform for the first time since it had been reported that he had been fatally wounded; and I have to state that, cracked or not cracked, his voice is neither worse nor better than it was in the very first instance when the clock struck him to indicate the hour. In other words, the bell merely emits the same imperfect sound as before, being remarkable for metallic harshness and doleful continuity of tone. Now, although I think this bell, like its predecessor, was designed and cast too thick at the sound bow over to produce a rich and mellow tone, even supposing no deep crack to exist, yet as the bell is suspended in a manner so objectionable that it has not fair play, the authorities may be advised to try the following experiments:—Release poor Ben from his present unhappy position, of which he has always bitterly complained; then fix him to a block of "wood" of suitable form called a stock, which must be freely suspended from a beam so as to be able to swing in some degree. If the alleged fracture be not dangerous, Big Ben the second will then give out such a sound as may agreeably surprise his audience. Permit me to add that when a large bell is cracked at the sound bow, it is idle to talk of applying the "drill-a-hole and whip-saw remedy." This has been tried over and over again in the case of Church bells—though not at present in that of Big Ben—and the result has uniformly been most unsatisfactory to a musical ear. I am, &c.,

THOMAS WALESBY.

December 5, 1859.

Mr E. Edwards, glass-manufacturer, of Birmingham, states that glass, when cooled too quickly, is rent into fragments which are invariably found to be wedge-like, or following the general shape of the arrow or spear heads recently found deep down in pre-Adamite geological beds. Hence he starts a theory:—He supposes that in the early geologic periods masses of flint or large boulders may have become heated by subterranean fires, and while in an incandescent state have been suddenly thrown by volcanic force to a cool place; the outside of the mass would soon begin to contract, while the inside would retain its heat and its expanded condition; the struggle between the two forces would go on until the mass was rent to fragments, and each of these fragments would be one of the "works of art" of which we have lately heard so much.

The following regulations for the admission of the public have been arranged by the Committee of Council on Education and the Trustees of the National Gallery. 1. The separate entrance to the National Gallery, British School, provided at the request of the trustees of the National Gallery, will be open for the public on Mondays, Tuesdays, and Saturdays, and for students on Wednesdays, Thursdays, and Fridays, in the daytime only. 2. The public will be admitted to the National Gallery, British School, also through the Museum every day, and on those nights when the Museum is open, according to the regulations of the Museum. On those nights the National Gallery, British School, will be lighted by the department. 3. Wednesday being a public day at the National Gallery, and a students' day at the South Kensington Museum, will hereafter be a students' day at the National Gallery, British School, and the public admitted on payment of (6d.) to the South Kensington Museum will be admitted also to the National Gallery, British School, through the Museum only, the National Gallery students being admissible by the separate entrance. 4. On Wednesdays, Thursdays, and Fridays, when only Students are admitted to the National Gallery, British School, the public admitted by payment (6d.) to the South Kensington Museum

will be admitted to the National Gallery, British School, through the Museum only. 5. The National Gallery, British School, will be opened on Monday, 5th December.

Will some of our readers respond, if possible, to the following inquiry?

Abercarn, December 5th, 1859.

GENTLEMEN,—Can you kindly help me to obtain any information on the following subjects:—I possess the first three vols. of Holzsapfels Turning and Mechanical Manipulation, which of themselves, so far as they go, form an admirable work; but unfortunately there seems no prospect of the work being ever completed. Can any of your readers inform me of the titles and price of any modern works which would supply the deficiency, more particularly as to *plain turning* with and without the slide rest, &c.? *Ornamental turning* I do not so much care about. If you obtain for me the required information you will much oblige an old subscriber. W. R.

Captain John Norton, of Rosherville, writes:—

GENTLEMEN,—Having good and sufficient reason to believe that the authorities are now anxious to know who was the first to suggest, and practically to demonstrate the superior advantages of an elongated expanded shot, I beg to say it was devised immediately by myself from the expanding lotus pith base of the Malay tube-dart, which I submitted and fully explained to the select committee of artillery officers, at Woolwich, as far back as the summer of 1823. The officers now living that can bear testimony to the fact are, General Sir Robert Gardiner, R.A.; General Sir Richard Airey, now Quarter Master-General, Colonel Barlow, Chairman of the Southampton Dock company, Major Hector Straith, late Professor of Fortification at Addiscombe Military Seminary, Captains Thomson and Hadison, the last five of whom were present with my late regiment, the 3th, at the time. Colonel Beamish, in his memorable letter of August, 1852, to the editor of the *United Service Journal*, at page 3, gives a full and clear narration of the facts. I have left a specimen of this shot at the United Service Institution, Whitehall. Colonel Wilford, in his recent lecture at the United Service Institution, has truly stated that the great improvement in rifle efficiency is to be traced to the elongated form of the shot. I am, yours, &c.,

J. NORTON.

Rosherville, 5th December.

A gentleman who has himself invented guns, and taken them before select committee after select committee, sends the following:—

GENTLEMEN,—It is a well known fact in every official branch of the public service, the Armstrong gun is only Armstrong in name, and that it would not have found its way in that name, had not the Duke of Newcastle been appointed to the war department just at the moment the originality of the invention was about to be better known.

All men interested in inventions made for the public service quite agree with your remarks, gentlemen, "That the war office has not the right to spend the money of the nation" to serve the special purpose of any protégé of men in power; be it his Grace the Duke of Newcastle or the Right Honourable Member for Morpeth, Sir George Grey, who who may become the patron of the inventor. Captain Blakely's challenge of £500 will not be taken up by the fortunate maker of the so-called Armstrong gun "or any of his champions," however important it may be to all taxpayers, as you justly remark. They can better afford to give Captain Blakely £500 to say no more about the gun or its maker, lest it should lead to an open investigation as to who really invented the gun, and first brought it under the notice of the select committee at Woolwich. For the sake of the taxpayer and the efficiency of the service, Captain Blakely will serve Her Majesty best by calling the attention of the Executive through the Legislature, not only to the Armstrong gun, but other guns and mortars so strongly patronized by the Government since 1854, when his Grace of Newcastle, in his zeal for improvement, gave the start at Woolwich which has been so economically carried out. Let him show a disposition to do this, and no doubt the £500 will increase; and with it, a far better chance of his money being returned to him than by seeking justice from the Secretary of State for War, or challenging competition with the extraordinarily lucky maker of the Armstrong gun. OBSERVER.

LIST OF NEW BOOKS.

Douglas on Modern Systems of Fortification, 12s.
Engineers', Architects', and Contractors' Pocket-book, 1860, 6s.

Patents for Inventions.

ABRIDGED SPECIFICATIONS OF PATENTS

THE abridged Specifications of Patents given below are classified, according to the subjects to which the respective inventions refer, in the following table. By the system of classification adopted, the numerical and chronological order of the specifications is preserved, and combined with all the advantages of a division into classes. It should be understood that these abridgements are prepared exclusively for this Magazine from official copies supplied by the Government, and are therefore the property of the proprietors of this Magazine. Other papers are hereby warned not to produce them without acknowledgement:—

STEAM ENGINES, &c., 1065.
BOILERS AND THEIR FURNACES, &c., 1054.
ROADS AND VEHICLES, including railway plant and carriages, saddlery and harness, &c. *None.*
SHIPS AND BOATS, including their fittings, 1063.
CULTIVATION OF THE SOIL, including agricultural and horticultural implements and machines, 1073, 1075, 1081.
FOOD AND BEVERAGES, including apparatus for preparing food for men and animals, 1085.
FIBROUS FABRICS, including machinery for treating fibres, pulp, paper, &c., 1060, 1063, 1070, 1077, 1086, 1070.
BUILDINGS AND BUILDING MATERIALS, including sewers, drain-pipes, brick and tile machines, &c. *None.*
LIGHTING, HEATING, AND VENTILATING, 1052, 1058, 1061, 1066.
FURNITURE AND APPAREL, including household utensils, time-keepers, jewellery, musical instruments, &c., 1051, 1067, 1074.
METALS, including apparatus for their manufacture, 1076, 1084.
CHEMISTRY AND PHOTOGRAPHY, 1090.
ELECTRICAL APPARATUS, 1069.
WARFARE. *None.*
LETTER PRESS PRINTING, &c., 1079.
MISCELLANEOUS, 1053, 1055, 1056, 1057, 1059, 1069, 1071, 1073, 1078, 1080, 1082, 1083, 1087, 1088.

1051. J. H. JOHNSON. "Improvements in machinery or apparatus for grinding and polishing knives, and other articles of cutlery, and tools." (A communication.) Dated April 26, 1859.

This consists in the use, in combination with a grinding-stone or polishing wheel, of a revolving drum for carrying the articles to be operated upon, each drum being fitted with suitable matrices in which such articles are placed, the said matrices being adapted to give the required shape to the articles to be ground, and enable such articles to be ground and polished in a uniform manner. *Patent completed.*

1052. J. M. CIRIOUX. "Improvements in lamp-glasses and shades, applicable to gas-burners, light-houses, and railway-signals." Dated April 27, 1859.

This consists in making glasses and shades of crystal rendered convex either externally or internally, or on both sides, for lamps and lanterns, and applicable to certain gas-burners, to light-houses and railway signals, which convexity is obtained by known means, and by which a greater brightness is given to the light than by the ordinary glass. *Patent abandoned.*

1053. G. PRARSON. "Improvements in apparatus for cutting and shaping trenails." Dated April 27, 1859.

This apparatus consists of a cylinder, or box bored out to suit the shape and size of the trenails. One end of the box is enlarged, forming the conical head, and made with an aperture in the side for admitting the cutting blade, which is adjustable, and fixed with screws to the outside of the cylinder. This cutting blade is so shaped as to cut the cylindrical parts of the trenail as well as the conical head. A second cutting blade is fixed to the face of the tail-end of the box for cutting the ends of the trenails. The head-end of the cylinder has a guide plate screwed to the cylinder flange, while at the tail-end a washer or plate with an enlarged bore, and open at one side to allow of the escape of the shavings, is attached to a similar flange with bolts, by which the cylinder is also firmly fixed to a small chuck, which has an external screw for screwing on to the end of a revolving spindle. The pieces of wood intended for trenails are first cut into lengths equal to the lengths of two trenails, and as they are of an irregular form, they are formed in cylinders slightly tapered at both ends. These cylindrical pieces of wood are introduced through the guide-plate, and pushed in till the end reaches to, and is shaped by, the end blade, the cylinder with its blades revolving rapidly, whilst the piece of wood is held fast. This double trenail, after both ends have been cut, is then cut in two by the circular saw, and the heads faced by a cutter similar to the one for facing the trenail ends. The blade which performs this last operation is fixed in a separate cylinder. *Patent completed.*

1054. J. HYDE. "Certain improvements in steam boilers." Dated April 27, 1859.

This applies to those steam-boilers in which one or more internal flues are employed, and consists in suspending a water chamber within the flue or flues; these chambers are connected by tubes to the interior of the boiler to allow the water to circulate freely therein. The end of the water chamber near the bridge divides the products of combustion which, in passing along the flue, surround the water chamber, and distribute the heat. *Patent abandoned.*

1065. H. R. FANSHAW. "Improved apparatus or mechanism for drawing-off, filtering, and gauging liquids in butts, barrels, casks, and such like vessels, preserving the contents from deterioration from contact with atmospheric air." Dated April 27, 1859.

The patentee claims the use and adaptation of a bag with its adjuncts, which, by the introduction of air pressure, will occupy the void formed as the liquid is drawn off, sufficient pressure being kept up by this means to allow a free draught. Also the gauging and filtering apparatus described. *Patent completed.*

1066. J. and W. STUART. "Improvements in machinery or apparatus for manufacturing nets for fishing, and for other purposes." Dated April 27, 1859.

This invention is more or less based upon a net-making machine for which a patent for Scotland was granted to James Paterson, July 27, 1835. The mechanical arrangement by which the twine or yarn is netted, consists of a combination of needles, hooks, and fullers, the joint operations of which form a series of twisted loops extending across the machine. Through this series of loops a length of twine or yarn is carried by a shuttle, which consists of a long hooked wire or slender rod, which is caused to pass through the loops, and in traversing back to its normal position it draws with it the twine or yarn, which is cut off by a self-acting cutter when the traverse is completed. A corresponding arrangement is fitted on the other side of the machine, so that the two shuttles work alternately to form the series of equidistant knots in the material of which the net is manufactured. The object of the present invention is to modify the original machine before-referred to, so as to render it capable of producing the higher numbers of mesh or finer qualities of net, solely by mechanical means. There are various modifications included. *Patent completed.*

1067. J. R. SMITH. "Improvements in obtaining motive power." Dated April 27, 1859.

Here a wheel with a tubular or hollow run, capable of revolving in a vertical plane upon a horizontal axis, has attached to its periphery at equal distances apart, and all round it, a series of open cages or chambers, each containing a flexible diaphragm of tubular or bag form. The tubular or chamber space in the main wheel is filled with water, mercury, oil, or other liquid, and by means of certain other arrangements (the details of which we cannot give space to) the wheel is made to revolve in either direction. *Patent abandoned.*

1068. E. J. LAING. "Improvements in wet gas-meters." Dated April 27, 1859.

Here the patentee employs a ball or other suitable valve suspended by an arm or other suitable means from above in either or both of the gas passages of the meter, so that when the meter is in a correct position such valves will hang free of the openings they are capable of closing, but so soon as any tilting takes place these openings will be closed, and the passage of the gas stopped. These valves may be arranged in pairs so as to close either way. *Patent completed.*

1069. C. HAMP. "Certain improvements in locks." Dated April 27, 1859.

This relates to lever locks, and consists in constructing them with two distinct sets of levers, each operated upon by the bit or bits of the key; also in forming the keys of lever locks with two bits, each bit being intended to operate each of the aforesaid sets of levers for locking and unlocking the same. It is also proposed in some cases to use a loose curtain attached to the case of the lock. *Patent abandoned.*

1080. J. HOLROYD. "Improvements in machinery used for finishing woollen and other cloths." Dated April 27, 1859.

This consists in so constructing the bed over which the cloth passes that when the machine is set in motion, the bed shall move up and down in a vertical direction by self-acting means. As the cloth passes over this bed, and between it and the cutters, it follows that when the bed is raised the nap of the cloth is cut shorter, and that when the bed is lowered the cloth is left longer in the nap. This variation in the length of nap produces lines or stripes running transverse across the piece from bit to bit. *Patent completed.*

1081. T. LACEY. "Improvements in gas regulators." Dated April 27, 1859.

This consists in suspending and supporting a conical valve by a diaphragm of thin sheet caoutchouc or caoutchouc fabric in a tube or ring; in covering the top of the tube by a cover; in carrying a spindle from the upper part of the conical valve through a central aperture in the cover; in fitting a valve on the spindle having its seat on the top of the cover; and in forming a communication with the atmosphere from the chamber in which the upper valve rests, and through the aperture in the cover to the top of the diaphragm and valve. There are modifications included. *Patent completed.*

1082. Sir T. T. GRANT, K.C.B. "Improvements in ships' cooking apparatus." Dated April 27, 1859.

The patentee employs an apparatus of the following construction:—It consists of a fireplace or furnace combined with a boiler; the fireplace is at the front of the boiler, and the two edges or cheeks thereof are formed by water spaces in connection with the boiler; the bottom of the ash-pit also is formed in a similar manner. The top of the fireplace is formed of metal slabs, which serve as a hot plate. The back or bridge of the fireplace is formed by a water space also in communication with the boiler. Behind the hollow bridge is a chamber from which a series of small tubular smoke flues pass to a chamber at the back of the boiler in which ovens are placed; this chamber communicates directly with a chimney placed at the back of the apparatus. Over the boiler a steam chamber is formed which receives steam from the boiler by a pipe ascending from the top of the boiler, and terminating in a dome formed at the top of the steam chamber; this arrangement is to prevent water being forced over with the steam into the steam chamber. Within the steam chamber one or more cooking chambers are placed, and they are supported so that a space may be left for the steam around the said vessel or vessels. Cocks are provided at the exterior of the apparatus. On each side of the steam chamber brackets are fixed to support kettles or vessels which are supplied with steam by steam pipes connecting them with the steam chamber, and these vessels receive smaller vessels in which cooking may be carried on. *Patent completed.*

1083. T. GAUNTLEY, sen. "Improvements in the manufacture of fringes." Dated April 27, 1859.

Here twist lace machines are used, so that the warp threads are employed for producing the fringe as well as the traverse threads of the woven parts or heads of the fringe, and the bottom or carriage threads are employed to produce the longitudinal threads of the woven parts or heads of the fringe. The warp threads are shogged or moved to and fro a distance equal to the desired width for the fringes. *Patent abandoned.*

1084. J. KIDD. "Improvements in sewing machines." Dated April 28, 1859.

The inventor claims the principle of working the needle and the shuttle by one crank pin by means of the slots described. The principle of a shuttle moving in grooves in a race, and supported by the keels described. The principle of a feeder hanging on a centre and worked by the needle arm and needle slide, and the principle of the guide bar forming a guide and a regulator. *Patent abandoned.*

1085. C. RANDOLPH and J. ELDER. "Improvements in steam-engines and boilers." Dated April 28, 1859.

The patentee claims, 1, communicating the power of the engines to screw or similar propellers by mechanism capable of giving, either a direct connection with equal speed, or an increased speed by means of an indirect connection as described. 2. Constructing surface condensers with spiral or helical coils of pipes. 3. Constructing marine steam-boilers with two or more separate uptakes to each separate vessel or boiler, and the surrounding of such uptakes with steam drying or superheating chambers. 4. Arranging the tubes or corresponding passages of multi-tubular or similar steam-boilers with a downward inclination towards the smoke boxes. 5. Constructing combined heaters and steam generators as described with reference to the drawings. *Patent completed.*

1086. R. JONES. "An improved safety lamp." Dated April 28, 1859.

This consists in the lamps being provided with an extinguishing apparatus secured to the moveable head of the same through the medium of pendant framework, and so arranged as to admit of two metallic surfaces being brought immediately in contact with the wick on withdrawing the head, by which the light is extinguished, the draught holes being covered with gauze, and the lamp provided with the ordinary wire gauge, glass, lock-up head and handle, as also a flat wick, in place of the usual round one; a reservoir of oil is contained in the head, together with a pipe and thumb valve for supplying the burner. *Patent abandoned.*

1087. R. HARRINGTON. "Improvements in umbrellas and parasols." Dated April 28, 1859.

This relates to the construction of the runners, the object being to enable a parasol or umbrella to be placed in an eccentric position to the handle or stick. *Patent completed.*

1088. N. LIBOTTE. "A steam brake for mines, which may also be worked by hand." Dated April 28, 1859.

The patentee claims, 1, a method of arranging, combining, and constructing mine breaks, so that a wheel may be acted upon to operate as a brake by the application of friction or pressure against or upon the sides thereof. 2. An arrangement and combination of break in which a wheel having projections and sunken parts is acted upon by the pressure exerted on its sides by bars having projections corresponding to the recesses in the wheel, and operating as described. *Patent completed.*

1089. N. J. HOLMES. "Improvements in electric telegraphs, and apparatus connected therewith." Dated April 28, 1859.

The patentee claims, 1, the use of coils constructed so as to secure to any transmitted or received current an inductive influence always parallel to the axis of motion and polarity of any magnetized substance placed within the sphere of that influence, either externally or internally. 2. The use of such construction of coils whereby the polarity of the needle or indicators is always preserved at a uniform distance from the influence of the coil during the motion derived from any transmitted or received current. 3. The particular arrangements of conductors and parts necessary to secure these maximum effects of any current upon any magnetized or indicating apparatus, or apparatus used either for direct transmission of signals, or for local action, either as a visible, audible, or printing telegraph. 4. The use of two parallel or diverging magnetized needles, or other indicators used in combination with the parallelism of axis of motion with the direction of inductive influence of electric currents, so that each needle is in opposition to the axis of such inductive influence during any motion derived from any current or currents. *Patent completed.*

1070. E. LARDENOIS. "Improvements in the manufacture of pulp for paper, pasteboard, and other like articles." (A communication.) Dated April 28, 1859.

This consists in manufacturing pulp from vegetable substances without rags, by subjecting them, 1st, to the action of steam; 2nd, to the blows of heavy hammers, and to pressure between rollers; 3rd, to solutions of protoxide of sodium under pressure; 4th, to universal acids and to washings in water; 5th, to chlorine or chlorides, to carbonic acid, to oxalic acid, to heat, to galvanic currents, and to pressure. *Patent completed.*

1071. T. CLARKE. "Improvements in sheaves or pulleys for paying out and hauling in ropes, chains, and cables, for communicating motion to machinery, and for other useful purposes." Dated April 28, 1859.

This consists in constructing sheaves or pulleys in two parts, so that one or both of the flanges or slides of the groove in which the rope or cable travels shall be capable of being moved so that the two may be brought together or towards each other at one part of the circumference of the pulley, and nip or grip the rope at that part, while the ropes may travel freely over the other part of the pulley. The motion of the moveable part or parts, and therefore the gripping action, are produced by weighted levers, springs, inclined axles or otherwise. The gripping faces of the flanges or sides of the groove may be furnished with roughed steel plates, or with vulcanized rubber. *Patent completed.*

1072. J. WHEAT. "Certain improvements in drilling-machines employed for agricultural purposes." Dated April 28, 1859.

In carrying out this invention a wooden barrel is connected by a spindle to a suitable framing, and around this barrel a chain passes right and left, and is guided on to a half round wood gearing to which the ends of the chain are securely fixed; on the top of the spindle of the aforesaid barrel a handle is placed, by moving which handle from right to left, or vice versa, the course of the machine will be directed as required. *Patent completed.*

1073. W. A. TOMPSON and W. GREEN. "Improvements in apparatus for applying liquids to the throat and air passages for medical purposes." Dated April 28, 1859.

The patentees employ a flexible or other gas-holder or vessel containing an under pressure, and they connect this gas-holder or vessel with a pipe, by means of which a jet of air can be directed on to the interior of the throat of the patient. Before the air passes to the throat they cause it to become saturated with a

mist of the liquid (usually a solution of the nitrate of silver) which they desire to apply. This is effected by causing the air from the gascometer to pass into a small egg-shaped vessel of glass containing a few drams of the solution; the air is caused to enter near the upper part of the vessel on one side, and to issue from the top of the vessel to the escape tube or jet by which it is applied. The vessel which holds the solution also contains a piece of glass rod having a number of capillary passages formed from end to end of it, and one end of this rod rests in the liquid, while the other rises above it. The air in entering impinges on the surface of the liquid, and forces it through the passages in the rod; it is thus brought within range of the current of air, and is carried by it through the escape tube or jet. At the end of this tube there is a covering of very fine gauze of silver wire, through which the solution can escape to the throat only in an extremely divided state; the connection between this tube and the solution vessel is formed by a vulcanized india-rubber tube. *Patent completed.*

1074. A. BOYLE. "Improvements in the manufacture of certain parts of umbrellas and parasols." Dated April 28, 1859.

This relates to machinery whereby the ribs of umbrellas and parasols may be made from wire with greater facility and dispatch than heretofore. The stamp or fly presses for forming or straightening the ends or tips of the ribs are dispensed with. Sets of sliding bolts are arranged to work either horizontally or vertically, and to these bolts suitable dies or tools are affixed, and the bolts and dies are acted upon by cams, levers, or cranks, which derive their motion from a shaft provided with a fly wheel, and driven by any suitable gearing. The dies will then be made to perform the operations of flattening the tip and notch ends of the ribs, and also forming the indentation for the middle bit or joint (to which the stretchers are affixed) simultaneously or in rapid succession. *Patent completed.*

1075. W. M. CRANSTON. "A grass-cutting machine." (A communication.) Dated April 29, 1859. This invention is not intelligibly described apart from the drawings. *Patent completed.*

1076. W. CORRETT and W. CARMONT. "Certain improvements in the construction and arrangement of furnaces employed in the manufacture of iron and steel, and for other similar purposes." Dated April 29, 1859.

This consists, 1, in the use of a brickwork shield over the metal hearth for the prevention of all deleterious contact, whether arising from the gases of combustion, or from solid matters, as coke, &c., getting into the iron, &c., from the furnace. 2. In the use of a diaphragm or partition between two metal hearths heated from one furnace for greater convenience in the conversion of iron or steel. 3. In the use of a hopper with a self-acting arrangement of mechanism for the gradual supply of "physic" to the furnace or furnaces in the conversion of metals. *Patent completed.*

1077. J. W. WELCH. "Improvements in sizing or dressing yarns or threads for weaving." Dated April 29, 1859.

This consists in sizing or dressing yarns or threads for weaving, with a combination of substances not heretofore used for that purpose. To this end the patentee employs gelatine derived from animal substances combined with sulphate of magnesia. *Patent completed.*

1078. H. BOSSHARD. "An improved mechanism for obtaining and imparting motive power." Dated April 29, 1859.

The inventor proposes to construct a motor or driving apparatus capable of being motioned by wind, water, or other natural power, to consist of an arrangement of wheels and shafts usually known as clockwork. *Patent abandoned.*

1079. E. A. PORTER and W. H. BURKE. "Improvements in printing and other presses." Dated April 29, 1859.

In constructing a press according to this invention motion is communicated to the platten or moveable part of the press in the following manner:—An axis with a lever handle, or other instrument for giving a partial rotation thereto, is used, on which axis there is a boss or projection, against which, and in suitable notches or recesses, formed at opposite parts of its periphery, two of the edges of the two rectangular plates press; the other edge of one of these plates is received into a notch or recess in the platten, or other moveable part of the press, and the other edge of the other rectangular plate is received in a notch or recess in a cross-head or other reaching part of the press. It is preferred that the two edges of each plate should be formed into knife-like edges, and that they should be received into corresponding notches or recesses, but this may be varied. By this arrangement the platten

or moveable part of a press will be acted on very powerfully by the lever or other means used for causing the axis to rotate partly round, in consequence of the two plates being thereby brought more nearly into the same plane. When making a lithographic press the patentees employ a friction roller under each of the axes or necks of the cylinder or roller, over which the carriage of the press moves, and in order to ensure greater accuracy in the movement of the platten they prefer to apply apparatus as above described at both ends of the platten. They apply V or angular guides to the two ends of the platten. *Patent completed.*

1080. S. DE CAENNAVE. "An improved lubricating compound." Dated April 29, 1859.

The inventor mixes together oil ricini or castor oil, soft or potassa soap, palm oil, and virgin or American rosin, and melts them at as low a temperature as possible. He then adds, in a finely powdered state, bichlorate of mercury and pumice stone, and well mixes and incorporates the whole while warm. *Patent abandoned.*

1081. T. SMITH. "Improvements in cultivating implements." Dated April 29, 1859.

This relates to an implement which may consist of one or more sets of tines or teeth, and the forms of the tines or teeth may be varied, and such ends or points may be moveable, so that one implement may at different times work with different forms of points or ends to the tines. The tines are bent, the forward edges being concave, and the hinder edges convex. When having a single set or a row of tines or teeth across an implement, the upper end of each tine is fixed to a bar, either permanently or moveably, so as to admit of their distances apart being varied. The bar to which a set or row of teeth or tines is applied is connected by links to a lever which has its axis at or near the front of the implement. The tines or teeth move on an axis which passes through the whole of them, and the parts are so arranged that, by depressing the hinder end of the lever, the points or lower ends of the tines or teeth are lifted out of the land, and the parts are in equilibrium or nearly so, in order that it may not require much effort to lift the tines or teeth. The implement is mounted on wheels, one on each side, and one or two in the front. There are modifications included. *Patent completed.*

1082. W. WINSTANLEY and J. KELLY. "Improvements in pumps, and gearing and appliances for working the same." Dated April 29, 1859.

The patentees claim surrounding the head of the suction pipe with an air-tight chamber or casing, and elevating the discharge orifice of the suction pipe to a point above the level of the lower valves of the pumps. The application to pumps of the peculiar syphon-shaped discharge part as described. The peculiar arrangements for jointing together the lift valve and pump rod as described. Connecting fog horns to the air vessels of pumps by india-rubber tubing. *Patent completed.*

1083. J. TOUSSAINT. "A new process of modelling and moulding for galvano-plastic." Dated April 30, 1859.

The object here is the reproduction by electricity, in hollow or in relief, of leaves, flowers, fruits, shrubs, reptiles, fishes, birds, insects, shells, animals, and all objects, animate or inanimate, in groups or separately. *Patent completed.*

1084. J. DARLINGTON. "Improvements in zinc retort furnaces." Dated April 30, 1859.

This consists in so constructing retort or muffle furnaces used for the reduction of zinc ores, that hot or cold air may be forced through and among the fuel employed, so as to render the same incandescent, and so that coal may be supplied at the side in a caked or coked state. *Patent completed.*

1085. G. FRANCIS. "Improved apparatus applicable to the treatment of tea and other useful purposes." Dated April 30, 1859.

This apparatus consists of a horizontal flat sieve or riddle, with a vertical circular side, which the patentee forms either solid or perforated, and which he mounts upon a suitable frame work or stand. Above this sieve or riddle he constructs horizontal radial arms which spring from a vertical revolving centre shaft. These parts are enclosed in a suitable cover to confine the dust and so forth, and the top is provided with a hopper for introducing the tea, &c., to be operated upon. There is a receptacle below the sieve or riddle into which the tea, &c., falls when acted upon by the revolving radial arms and passed through the meshes of the sieve or riddle. The shaft carrying the radial arms is caused to rotate by the power applied through the meshes of the sieve or riddle. The shaft carrying the radial arms is caused to rotate by the power applied through a wheel and pinion, or any other suitable contrivance. *Patent completed.*

1086. J. MORISON, sen., and J. MORISON, jun.

"Improvements in looms and in apparatus connected therewith." Dated April 30, 1859.

This relates, 1, to certain improvements in jacquard apparatus of the kind used for acting upon leaves of heddles in the production of ornamental fabrics. 2. To certain improvements in details connected with shifting shuttle boxes; and 3, to an improvement in shuttles. The details are too voluminous to be quoted here. *Patent abandoned.*

1087. W. CLARK. "Improvements in ventilating or supplying air to diving bells and divers, and in holding communication therewith from above." (A communication.) Dated April 30, 1859.

Here a blowing apparatus is placed in position where the descent is to be made; on the shore or in the boat, raft, &c., are established two tubes of gutta percha or india-rubber of a length in proportion to the depth to be explored or operated in. One of the extremities of each of these tubes is in communication with the diving apparatus, one of which is open to the air and furnished with a speaking trumpet or funnel, while the other is joined to the induction tube of the blowing machine. The other extremity of each of these tubes is connected to the diving bell or other receiver, being firmly united to one of the two junctions which communicate with the interior thereof. Thus the interior of the receiver is on the one hand in communication with the exhausting tube of the blowing machine, and on the other hand with the atmosphere. In connection with the latter communication in the interior of the receiver is an india-rubber flexible tube, of just sufficient length to descend to the level of the mouth of the diver, and which has at its extremity a small mouth piece to facilitate conversation with the diver. The extremity that is free to the atmosphere for speaking, has a similar arrangement of parts for speaking or hearing. The apparatus thus established, and the diver being in the bell dressed in a dress of gutta-percha, &c., it is sufficient to put the apparatus to work, to work the blowing machine in order to produce the ventilation of the bell. The foul air in the bell is drawn off by the blowing machine, while the fresh air arrives by the second tube. *Patent completed.*

1088. A. MCKECHNIE. "Improvements in hammers and in apparatus for working the same." Dated April 30, 1859.

This relates to mechanically actuated hammers of frictional action, whereby variable blows may be given with rapidity, ease, and certainty, whilst the machinery is simple, &c.; the hammer can be suspended at any point required. We cannot give space to the details of the invention. *Patent abandoned.*

PROVISIONAL PROTECTIONS.

Dated Aug. 2, 1859.

1784. H. Fletcher. Certain improvements in sewing and embroidering machinery.

Dated Sept. 16, 1859.

2110. T. Richardson. Improvements in the manufacture of sulphuric acid and in applying the heat generated in the process.

Dated Sept. 27, 1859.

2180. F. Simpson. An improved method of fastening or securing envelopes and other like receptacles, also for affixing postage stamps, receipt stamps, and all other similar labels requiring adhesive properties.

Dated Oct. 5, 1859.

2254. J. A. Herbert. Manufacturing of oxychloride of lead. (A communication.)

Dated Oct. 13, 1859.

2338. T. Vicars, sen., T. Vicars, jun., T. Ashmore, and J. Smith. Improvements in the manufacture of bread, biscuits, and like articles, and in the machinery and apparatus connected therewith.

Dated Oct. 19, 1859.

2390. J. K. Blackwell. Improvements in reverberatory and other furnaces. (A communication.)

Dated Oct. 24, 1859.

2426. P. M. A. Laurent. Certain improvements in eye-glasses for optical instruments.

Dated Nov. 4, 1859.

2519. J. G. Meyer. The employment of the "tacca pinatifida" as a substitute for straw now used in various manufactures.

Dated Nov. 10, 1859.

2558. S. W., and H. Evans. Improvements in polishing thread and yarn, and in machinery to be employed for that purpose.

Dated Nov. 15, 1859.

2594. W. H. Ward. Improvements in wheels for railway engines and carriages.

Dated Nov. 16, 1859.

2506. O. Green. Improvement in the method of applying heat in the manufacture and drying of salt.

2507. W. Baker. Apparatus to facilitate the delivery of coins, for the giving of change and the like.

2508. W. Johnson. Improvements in gas-burners. (A communication.)

2509. R. White. Improvements in shirts.

2500. T. Greenwood and J. Batley. Improvements in the construction of the beds of lathes, and the tables of planing machines.

2601. G. Taylor. An improvement in the mode of manufacturing wrought iron crank axles.

2602. J. Burrow. Improvements in umbrellas and parasols.

2603. J. Ward and H. Burman. Improvements in machinery for making bricks and tiles, and for moulding peat and plastic substances.

Dated Nov. 17, 1859.

2604. J. A. Drieu and A. Légeay. A tissue, being a substitute for leather, mill-board, and papier-maché.

2605. I. White. Improvements in glass furnaces.

2606. D. Jones. Improvements in metallic casks.

2607. R. Laming. Improvements in obtaining alkalies and alkaline compounds.

2608. T. Robinson. Improvements in steam-engines.

2609. J. L. Jullion and G. Piric. An improvement in the manufacture of paper.

2610. J. McKenzie and S. T. Wentworth. Improvements in breach-loading fire-arms.

Dated Nov. 18, 1859.

2611. J. H. Brierley. A bolt or band-fastener.

2612. W. Gossage. Improvements in the manufacture of carbonate of soda.

2613. J. Pinchbeck. Improvements in consumers' compensating gas meters, which are partly applicable to ordinary consumers' meters.

Dated Nov. 19, 1859.

2615. S. Corbett. An improvement or improvements in pulpers for pulping food for cattle.

2616. W. Clark. Improvements in the preservation of animal and vegetable matters. (A communication.)

2617. W. Blinkhorn. The novel application of certain materials to the manufacture of bricks, quarries, or tiles, to be employed principally in the construction of furnaces as fire-bricks.

2618. J. Knight. Certain improvements in or applicable to looms for weaving, part of which is applicable to lubricating axles and bearings for other purposes.

2619. E. Barlow and F. Hamilton. Certain improvements in carding engines.

2620. A. H. Le Pontois. Improvements in machines for distributing seed and manure.

2621. J. Bancroft. Improvements in the manufacture of fabrics adapted to be used for curtains, coverings of furniture, table covers, and such like uses.

2623. A. Godechaux. Improvements in the mode of printing forins, or models, or copies of penmanship and designs on paper, and other fabrics.

2624. J. Petric, jun., and J. Lord. Improvements in machinery or apparatus for drying rags, wool, and other fibrous materials.

2625. A. V. Newton. Improvements in the mode of and machinery for drying cloths. (A communication.)

2627. G. Laidlaw. Improvements in hats, and other coverings for the head.

2628. H. Naylor and W. Crossley. Improvements in pickers used in looms for weaving.

Dated Nov. 21, 1859.

2630. P. Jochem. Improvements in brakes for railway and other carriages.

2632. J. Cowan. Improvements in "bracing" or connecting the angles or corners of chairs, and other like articles of cabinet-furniture.

2630. J. Apsey and W. H. Buckwell. Improvements in boilers and other furnaces, smoke consuming and steam generating.

Dated Nov. 22, 1859.

2638. E. T. Hughes. Improvements in weaving silk and other materials, and in the machinery or apparatus employed therein. (A communication.)

2640. J. Stand and J. Rowley. Improvements in fire-engines, parts of which improvements are applicable to other pumps.

2644. W. E. Newton. Certain improvements in obtaining compensation for the effects of changes of temperature in time-keepers. (A communication.)

2646. R. Mushet. An improvement or improvements in the manufacture of iron and steel.

NOTICES OF INTENTION TO PROCEED WITH PATENTS.

(From the London Gazette, Dec. 6, 1859.)

1732. J. B. Whitehall and S. Wheatcroft. Cap fronts.

1739. G. Davies. Dyeing. (A communication.)

NOTE.—Specifications will be forwarded by post from the Great Seal Patent Office (publishing department) on receipt of the amount of price and postage. Sums exceeding 5s. must be remitted by Post Office Order, made payable at the Post Office, High Holborn, to Mr. Bennet Woodcroft, Great Seal Patent Office.

LIST OF MISCELLANEOUS TENDERS IN VITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

RAILWAY IRON, Seaside Railway.—For from 5,000 to 7,000 tons of rails, with a proportionate quantity of fishing plates. Tenders, 10 o'clock morning of 13th inst, Gresham House, Old Broad-street.

SLEEPERS, South Wales Railway.—For the supply of 10,000 sleepers. Specification at the Chief Office, 10 Eastbourne-terrace, Paddington; or office of Mr. W. G. Owen, Company's Engineer, Gloucester. Tenders, December 13th.

CARRIAGE TYRES AND AXLES, &c., South Eastern Railway.—For carriage tyres and axles, cast iron boxes, wrought iron rings, axle boxes, buffer rods, horse-hair, and plate-glass. Specifications, patterns, &c., Station-master's office, Bricklayers' Arms Station, Old Kent-road, London. Tenders endorsed "Tenders for Tyres," to Mr. S. Smiles, Secretary, Dec. 14th.

WAGGONS AND TRUCKS, South Eastern Railway.—For the supply of 100 new goods wagons, 100 new coal wagons, and 50 new timber trucks. Patterns, &c., Station-master's office, Bricklayers' Arms Railway Station, Old Kent-road, London. Tenders endorsed "Tenders for New Wagons," to Mr. S. Smiles, Secretary, Dec. 1.

WATER-WORKS, Heywood.—For the execution of the earthwork, puddling, and masonry required in raising the embankment of the upper reservoir of the Heywood Water-works Company, near Naden Head, in the Township of Spotland; and for other works. Plans at the offices of Messrs. Cawley and Radford, Civil Engineers, 41 John Dalton-street, Manchester. Tenders, Secretary of the Water-works Company, Heywood, Dec. 22nd.

SEA WALL, River Wear.—Commissioners.—For the work required in the erection of a sea wall, near the south outlet in front of the battery intended to be erected there. Plans, &c., Engineer's Office, Commissioner's Quay. Tenders, Executive Committee of the River Wear Commissioners, endorsed "Tenders for Sea Wall, South Outlet," Dec. 13th.

FARM, Homestead, Lavinton.—Plans, offices of Mr. Wilkinson, architect, Oxford. Tenders, Dec. 10th.

HEATING APPARATUS, Chelsea.—For the heating of the new vestry hall. Plans, &c., office of Mr. W. W. Pocock, 10 Trevor-terrace, Knightsbridge. Tenders to Dec. 17.

WARMING CHURCH, Rugeley.—For warming the church with a hot-water apparatus. Tenders, accompanied by a plan and specification to the Churchwardens of Rugeley, under cover to Mr. James, bookseller, &c., Dec. 17.

SEWAGE, Warrington.—For the construction of main sewers with their appurtenances embodied in contracts 10 and 11. Drawings and specifications, Mr. Benjamin P. Coxon, borough engineer. Tenders for each contract a separate tender, Chairman of the Paving and Sewerage Committee, Town Hall, 6 p.m., Dec. 12.

DESIGNS AND ESTIMATES FOR CEMETERY, Sittingbourne, Kent.—For designs, &c. (free of expense), for the erection of two chapels and an entrance lodge, with entrance gates, and for boundary, fencing, draining, and laying out the ground, which is square in form and three acres in extent. Average number of burials sixty per annum. The architect of plan adopted will be employed to superintend the works, all other plans will be returned to the owners. Plan of ground, &c., Mr. G. Harris, clerk to the burial board. Designs and estimate, Dec. 14.

FOREMAN AT IRONWORKS.—For a forge in the vicinity of Manchester, must have a thorough practical knowledge of puddling and roller, and be provided with first-class testimonials as to character and ability. Address, stating age, references, and where last employed, Y 80, Manchester Examiner Office.

OVERLOOKER.—Overlooker for twenty puddling furnaces and two bar-mills. Box 70, post office, Wolverhampton.

CLERK OF WORKS.—Sowerby Bridge Cemetery, to superintend the erection of chapels, lodge, boundary walling, draining, and approach road to the works. Terms, experience, and testimonials "To the Chairman of the Cemetery Committee," Dec. 14, before 12 o'clock, a.m.

BRASS FINISHERS AND MOULDERS.—Wanted first-class workmen at an old established London firm. Apply by letter, stating full particulars, to Mr. J. J. Taylor, 116 Fenchurch-street. A preference given to those accustomed steam-cock work.

THE
MECHANICS' MAGAZINE.

LONDON, FRIDAY, DECEMBER 18, 1859.

AN AMERICAN SHIPBUILDER
ABROAD.

WE announced to our readers a few weeks since that Mr. Donald McKay, shipbuilder, of Boston, United States, had arrived in this country on a professional tour. Remembering the outcry which was made eight or nine years since, when we happened to reduce Mr. Griffith's American volume on Shipbuilding in the crucible of English science, we resolved, as soon as we heard of Mr. McKay's arrival, to do our best to show him all the consideration which so distinguished a member of a distinguished profession and a distinguished nation deserves. We feel compelled now to offer a few remarks concerning our visitor's opinions and statements, in which we shall be found to differ seriously from him, but hope to do so without departing in the least degree from our resolution.

Many facts respecting Mr. McKay's present visit to England and his contemplated tour on the Continent of Europe became privately known to us from time to time, but the first thing which brought the subject formally under our notice was the receipt of a printed paper, bearing a London imprint, and entitled "A Practical Refutation of the English Prejudices regarding the Durability of American-built Ships and American Timber. Illustrated by a List of American Ships (Merchant, Men-of-War, and Steam Ships); distinguished by their Long Durability. Prepared by Donald McKay, Shipbuilder, of Boston, United States." On the title-page we are informed that these lists of ships were prepared for the purpose of "proving by facts" that ships built with carefully selected American timber—viz., live oak, white oak, pitch pine, &c.—will last as long as ships built with the best English oak, "in contradiction to the views entertained by 'Lloyds' Committee, and in support of the favourable opinions entertained by British merchants in regard to the efficiency and safety of American ships." We are likewise told that this paper is extracted from the manuscripts of "a comprehensive and richly illustrated work" on the theory and practice of Naval Architecture, which is shortly to be published by Mr. McKay.

On examining the paper we find that it comprises, first, a list (extracted from the *New York Marine Register* for 1859) of merchant vessels built in America, and with American timber, that have been found in an efficient sea-going state after more than twenty years of service, and are yet in actual service in 1859. This list gives 102 ships of an average age of 24 years; 40 barques of an average of 25½ years; 54 brigs of 25 years; and 12 steamers averaging 18½ years. We think we need hardly say there is nothing extraordinary in this list. If Mr. McKay will take the trouble to look through Lloyd's list, and to count the number of English-timber-built ships therein of an age exceeding 20 years (an operation which we have not leisure to amuse ourselves with) he will find that his American list will stand no sort of comparison with that for which Lloyd's furnishes material. We have glanced casually through Lloyd's list, with this question in view, and we predict that if Mr. McKay will do the same he will be not a little astonished. We have, we venture to say, many scores of vessels not only 24, but between 50 and 100 years of age; indeed, there are several vessels in our

Custom House Registry more than 100 years old.

The paper next deals with men-of-war, and enumerates 9 line-of-battle ships averaging 38½ years of age; 5 frigates averaging 26 years; and 19 sloops and 4 brigs averaging 22 years. At the end of this list Mr. McKay asks, somewhat triumphantly as it seems to us,—"Can the English navy present a result more satisfactory than this?" Now, in considering this question, we must remind ourselves and our readers that all Mr. McKay tells us of these ships is, that they are "in perfect preservation" and in an efficient state up to this date. Well, if this be all, we may answer at once,—"The English navy can present a result more satisfactory than this." In the English navy we have 9 line-of-battle ships, not only over 38½ years of average age, but of 50 years of age—every ship of them—and all "in perfect preservation and in an efficient state up to this date." These are the Ajax, Implacable, Foudroyant, Victory, Egmont, Queen Charlotte, Impregnable, Hogue, and Edinburgh. We have upwards of twenty such ships individually of the age of Mr. McKay's average. So much for line-of-battle ships. As to frigates we venture to say we have nearly half-a-hundred of them each reaching Mr. McKay's average of five frigates, viz., 26 years; and in smaller sailing ships also we doubtless exceed his average of 22 years. With regard to steamers of war, it is only necessary to say that against nine American which Mr. McKay mentions, averaging 14½ years, we could set as many averaging double that age! We have at least forty reaching Mr. McKay's average. Only last week we were ourselves looking at the Salamander sloop in the basin at Deptford Dockyard—a ship built 27 years since—and learnt that new boilers are preparing for her at the Sheerness factory, in the expectation that after certain necessary repairs are made, she will still be perfectly sound and fit for service. We need hardly enlarge upon these points.

Mr. McKay appends to his list of United States men-of-war ships over fifteen years of age a foot-note, which stands thus;—"The term '[15 years] assigned to the average duration of British men-of-war ships, after which they require a complete and extensive repair. Statement of the Surveyor of the Navy.'" But if the Surveyor of the Navy's remark is rightly interpreted, it implies nothing whatever in Mr. McKay's favour. Does he wish us to think that the American ships averaging 38½, 26, and 22 years of age have never undergone such repairs as the Surveyor refers to? Surely not. If they have not, we should like to possess some authentication of their alleged state of "perfect preservation" and efficiency.

The next and last division of Mr. McKay's printed paper consists of certain tables and observations on the weight and strength of American ship-timber, which we reprint, for the sake of convenience, upon another page. The frames of American ships of war are built of "live oak;" their planking being of "white oak;" and live oak and white oak take prominent places in these tables and observations. To tell the whole truth, we ought also to say that one part of Mr. McKay's business in this country appears (from what has passed between him and some of our shipbuilders) to be to get orders for American timber—white oak in particular. He would have us believe, as the article on another page shows, that American white oak is not only equal, but superior to English oak: "the advantage of lightness combined with strength, is entirely on the side of 'American white oak.'" It is all very well for

him to state the case in this way, but we must guard shipbuilders against proceeding blindly in the matter. American white oak is a thing of very variable nature. The States' white oak (which is generally better than the Canadian) is of totally different qualities when grown under different circumstances. That grown on the hardy soils near the sea-coast, where it is subjected to the rude retarding influences of wind and storm, possesses a stoutness and strength which is nowhere to be found among the oaks that spring up in the moist inland rapidly and untried to maturity. The timber from trees of the latter class—a light and free-splitting material—is what we see most of in this country, and what, we fear, is most frequently used in America itself. If it does not pay the Americans to use the high-priced better kind, it is exceedingly doubtful whether we can afford to do so.

But we can do more than place our opinions in antagonism to Mr. McKay's. Examples of the failure of the American white oak as a shipbuilding timber—of its early and general decay, that is—have come under our notice even in the American war navy itself. The *Scientific American* of a few weeks since published an announcement, which we think may be reproduced here to good purpose. It is to the following effect:—"The steam frigate Minnesota, which was found to be rotten, and is now undergoing repairs at the Charlestown Navy-yard, is only five years old, and has made but one cruise. All her outside planking, from the water-line to the plank-sheer, is decayed. Many of her knees are also unsound, so that she will have to be rebuilt to fit her for service. All the decayed timber is white oak; and some of the yellow pine, with which the oak came in contact, is also rotten. Yellow pine is considered rot-proof in consequence of the great amount of rosin which it contains; but the presence of the decaying white oak produced eremacansin in the pine in this case, in the same manner that a little leaven promotes fermentation among a large quantity of matter. The live oak in the Minnesota has not been the least affected with the rot; it is as fresh as when put in. These are important facts for shipbuilders." We agree with our contemporary; these are important facts for shipbuilders—particularly for British shipbuilders, who must keep them in mind during Mr. McKay's stay among us.

Having had an opportunity of seeing the prospectus of Mr. McKay's contemplated work on the "Theory and Practice of Naval Architecture," we had almost persuaded ourselves that something of real value upon this subject was at last coming to us from America. But our expectations have been sadly stricken down during the last few days. Mr. McKay, like every other American, is writing home elaborate descriptions of what he sees in this country, and some friend (or enemy) of his at home has published extracts from his letters in the American journal before referred to. In these extracts we find things which greatly depress our estimate of Mr. McKay's professional ability. That he should tell his friends (as he does) that the clipper ship Lightning, designed and built by himself, "is this day considered 'the swiftest sailing vessel under the British flag,' is perfectly natural; it is equally natural that he should 'have no hesitation in asserting that our (American) models for speed are very superior to any that I have yet seen in the Royal dockyards' of England. But in one part of his letter Mr. McKay expresses an opinion or two which certainly should be noticed. During his visit to Liverpool, he writes:—"The Donegal, of 101 guns,

"is at anchor in the Mersey. She is of a very full and clumsy model, and does not seem capable of going more than four knots with steam and sail combined. The man who designed her appears to have derived his ideas of naval architecture from a Dutch galliot. Her model is a disgrace to the Board of Admiralty that sanctioned it." Now, we shall write quite courteously when we say that these remarks render it almost impossible for us to feel any further respect for Mr. McKay's professional opinions. He goes to the Mersey and sees a splendid line-of-battle ship at anchor, and predicts a maximum speed of four knots under steam and sail together; whereas, on the 16th of July last this very ship, the Donegal, made at the measured mile at Plymouth, under steam alone, TWELVE knots within a fraction—11.912 knots being the exact speed recorded! The fact is that this ship, which this guest of ours deems a disgrace to the Admiralty, is an exceedingly good ship. In the Admiralty tables which we published in the spring we have the particulars of two ships of the line, the Conqueror and the Marlborough, of the same nominal and nearly the same indicated horse-powers as the Donegal, and in respect of speed the Donegal is the best of the three, that of the Conqueror being 10.853, that of the Marlborough 11.06 on one occasion, and 11.866 on another, while her's was, as we have said, 11.912. We will only add that the disgrace attaches itself in this case, not to the British Admiralty, but to the American shipbuilder who can deliberately pen such trash about us; and we almost feel as if a little of the discredit clung to us because of our condescending to refute the nonsense he has written.

THE FORCES USED IN AGRICULTURE.

We are exceedingly proud of ourselves, we meh. The spirit within us is very conscious of itself, and not a little ambitious. Not Plato's sense, not Bacon's wisdom, not Shakspeare's poetry satisfies us. Genius may light the land, and cover the race with glory, but our conception of what man might and ought to be is still far from realisation. On the very mountain tops of thought our cry still is—Excelsior! Excelsior! This is one way of looking at ourselves. But there is another way of doing this—a way equally true and just, but marvellously different. Spiritually we are, for all practical purposes, unrivalled. No loftier beings, no brighter intelligences, meet us in the arena of life, and compete with us for gifts or blessings. But, physically, how differently we are placed! Here the dumb brute, the lifeless machine, not only compete with, but beat us. As motive-power machines especially, the beasts of the field outstrip us, and steam-engines, the works of our own hands, surpass us immeasurably.

At the Society of Arts, a few evenings since, Mr. J. C. Morton instituted a very interesting inquiry into the relative values of men, horses, and steam-engines as agricultural labourers, and the parts which they are severally destined to play in the fields and farms of the future. His paper is one of the most valuable contributions to agricultural literature that the past twenty years have produced, and well deserves the attention of scientific readers. Mr. Morton first points out the fact that there are three classes under which all the operations of the farm may be arranged, and they correspond exactly to the three forces which we have at our command. In the first, where the greatest uniformity obtains, the greatest power is needed; and a purely mechanical force, acting through

levers, wheels, and pulleys, is in this way sufficiently under our control for their performance, and this class of operations increases in extent and in importance with almost every permanent improvement of the land, that is, with everything which tends to the uniformity of its condition. In the second class, as much force is needed; but rocky subsoil, awkward hedge-rows, crooked roads, and scattered produce, interfere with any possibility of uniform procedure. Some machinery more pliable than cranks and rods is needed by which to carry out the purpose of the mind; and here, therefore, it must work by means of the teachable and powerful horse. This class of operations diminishes in extent and importance with every permanent improvement of the soil, that is, with every removal of the obstacles referred to. In the third class, the care and cultivation of individual life, vegetable and animal, are concerned: no great power is needed, but there is need for the constant and immediate exercise of the will, varying, it may be, at every successive moment; and here, therefore, the human mind can work only by its most perfect instrument—the human hand. It is plain that everything by which, on the one hand, land is brought to a uniform condition, and by which, on the other, the quantity of its living produce is increased, will extend the first and last of these three fields of agricultural operations, and will diminish the necessity of employing horses. "And this," says Mr. Morton, "is no mere speculation; it is the principal lesson of the agricultural experience of the past few years."

The forces used in agriculture, thus considered, form a very extensive subject, and one upon which Mr. Morton has thrown much new light. In the first place, he makes a more particular comparison of steam-power, horse-power, and hand-power for the cheap performance of mere labour. In describing steam-engines the term "horse-power" is used as a unit of force, and is assumed to be equal to the pull or lift of 33,000 lbs. one foot per minute; and to this agricultural experience agrees. Mr. Morton says, for a pair of horses will draw a plough along with an average pull of 300 lbs. at an average rate of $2\frac{1}{2}$ miles per hour, or 220 feet per minute, and this is the same as if the 300 lbs. were pulled over a pulley, or lifted that height in the time; and 300 lbs. lifted 220 feet per minute is just the same as 66,000 lbs. lifted 1 foot high per minute, which, as the performance of a pair of horses, is exactly the 33,000 lbs. each at which their force is valued by the engineer. But in a comparison merely of the cost of horse-power in the animal and in the engine the great superiority does not appear which really belongs to the latter. In addition to this, the performance of which they are severally capable must be taken into account. An ordinary 10-horse power locomotive agricultural engine will, according to the Chester judges of the work done by Fowler's steam-plough there, cost in coals, oil, water and attendance, and wear and tear of implement and engine (but excluding interest on capital employed), nearly 45s. a day, or about 4s. 6d. an hour, which is 5.4d. per hour for each nominal horse-power exerted; but as the real force exerted is more often that of 20 horses in the case of a 10-horse power engine, we must really divide this by 2, and call steam-produced horse-power worth 3d. per hour. The cost of horse labour on 21 farms in different parts of this country, of which the particulars have been given to Mr. Morton, was 5d. per horse for each of the working hours of the year. Besides this, the estimated expense of Fowler's engine was excessive, and the nominal power of it was cer-

tainly below the actual force at which it could be worked with the estimated quantity of coal consumed—11 lbs. of coal per hour for every horse-power produced, which is the consumption named for Fowler's engine, and the majority did not consume more than six to eight pounds.

Again, a horse at plough with an average length of 120 yards of furrow, loses one-third of his time on the headland in the mere act of turning the plough. At the dung-cart not one-third of his time is employed in the actual conveyance of the load. Indeed, this loss of time is a necessary part of his employment, however he may be engaged. He can pull 33,000 lbs. one foot high in a minute, but he cannot keep that performance up for 10 hours at a time. On six farms, the details of which Mr. Morton has so ascertained as that all the ploughing, scarifying, harrowing, rolling, horse-hoeing, carting—all the horse-labour, in fact, on each—is converted into lbs. lifted so many feet per minute throughout the working year, he finds that the actual performance per hour through the year is not 33,000 lbs. one foot high in a minute, but more nearly one-half that quantity, varying from 14,000 lbs. in the lowest case to 19,000 lbs. in the highest. No doubt, even in the case of steam-power, there must be periods of waste labour—ploughs must be turned upon the headland even if it be done by steam—but these occasional periods of comparatively fruitless work are, as he says, no necessary condition of steam-power; it is better if maintained continuously, and machinery will be invented to reduce this waste time to a minimum with a positive advantage to the efficiency of the engine.

Moreover, the relative cost of the two forces is affected not only by the question of time during which each can be continuously maintained, but also by the quality of the performance of which each is capable. In threshing, uniformity of speed is a condition of good work; it is more easily maintained by steam-power than by horses. In ploughing, the avoidance of trampling and of pressure generally is almost a condition of good work, and it is more easily obtained by steam-drawn machinery.

We next come to the estimation of the cost of manual labour engaged in mere work—that is, where the least degree of skill is called for. From a series of statistical facts prepared by him, Mr. Morton finds that the mere force of a man, at a cost of say 3d. an hour, as equal to a lift (in four different instances) of 250, 330, 500, and 370 lbs. per minute; the two former being cases where the load has to be detached as well as lifted, and the third being performed under the influence of good harvest fare; and he compares this with the duty of the steam-engine—or 33,000 lbs. one foot high per minute for 3d. per hour, and also with the actual average performance of the horse—16,000 lbs. lifted one foot per minute for 5d. an hour. In order, at the best rate named, to do the work of the steam-engine, 66 men would be required at a cost not of 3d. but of more than 15s. per hour; and in order to do the work of the horse 32 men would be needed at a cost of 8s. instead of 5d. an hour. It is plain that if we can take much of the mere labour of the farm out of the hands of the labourer, and avail ourselves of steam-power for its performance, there is an enormous amount of saving to be made in the cost of agricultural production. It is plain that it is but folly in the labourer to think that as regards the mere labour of the land he can compete with either steam-power or with horse-power. It is manifestly, therefore, in the cultivation not so much of mere strength of

body as of skill and intelligence, that the safety of the labourer lies.

As the matter at present stands, then, and confining ourselves to that large and increasing class of operations in which the power required is great and the process almost uniform, and looking only to the cost per unit of work done, we have seen that steam-power stands decidedly first in the race, horse-power is a tolerably good second, and the agricultural labourer is literally nowhere. There are, however, as Mr. Morton points out, two considerations which greatly affect the position of horse-power in this competition, and place it much farther back than it would at present seem to be. They both affect its fitness for those acts of cultivation where it is plain that there is the greatest room for an extended use of steam-power. We refer, first, to the injury done to the land by the trampling of draught animals; and, secondly, to that irregularity of employment on the farm for horses during the year, which in effect makes you keep upon a large farm several horses all the year round for the sake of their work during a few weeks of spring and autumn. We have not space to enlarge upon these two considerations, but the reader will see their very great importance without difficulty. Suffice it to say, Mr. Morton after making careful calculations estimates that by steam-power at least three out of every seven horses on arable land may be dispensed with all the year, at a cost not exceeding the cost of these horses during the three or four months when alone they are really needed on the land. The first class of operations then upon the farm, which includes the ploughing and turning of the soil, will be taken by steam-power out of the field of horse-labour, just as threshing, and cutting, and grinding have been taken by it out of the field of hand-labour.

To the second division of farm work Mr. Morton refers but very briefly. It includes such cases of ploughing and cultivation as are taken, by very rocky subsoil and very crooked hedgerows, out of the scope of the steam-driven plough; it also includes the lighter class of horse-work, such as harrowing and horse-hoeing, which, however, might very well be done by steam; and it more especially includes the work of carriage, which, considering the scattered position of the produce to be collected, and the crooked roads along which it must be drawn, he sees no probability, as long as these remain, of getting done except by horse-power and manual labour in the usual way. Mr. Halkett does, indeed, propose to remove these obstacles, and is therefore able to accomplish all by steam, although at what cost we at present know not.

The third class of operations includes the lighter work, requiring skill and thought as well as labour. The planting of a seed equidistantly within the land may be done by machinery, but the culture of the young plant, much of the hoeing of the land immediately around it, and its treatment during growth according to its condition, must be left to the hand. When ripe it may be harvested by horse-drawn implements; our corn crops are reaped, our potatoes may be dug, and roots are cut from the ground by horse-drawn machines—they must, however, be gathered into bundles or heaps, and ultimately removed by the help of manual labour. When stored they are threshed, and ground, and cut, and steamed by steam-driven engines, but they must be administered as food by manual labour.

There is one happy fact which Mr. Morton, by facts and figures, places altogether beyond doubt, viz., the introduction of steam-machinery for agricultural purposes, which has had the effect

of benefiting the agricultural labourer, and not of injuring him, as many predicted. The explanation of this fact which Mr. Morton offers, and which seems to us to be the correct one, is this: that agriculture is more and more becoming the work of intelligence and skill as well as power—those parts of its processes where intelligence and skill are wanted, are becoming a larger portion of the whole. Cultivation is more perfectly performed, and over a greater extent of land—the crops cultivated require more labour and are more productive—the stock consuming them is proportionally larger and needs proportional attendance. But, whatever the explanation be, the fact is certain, as he says, that the use of steam-power on a farm is a part of that system which employs most labourers in agriculture. Mr. William Smith, of Woolston, who has an 8-horse engine for 110 acres of arable land and 70 acres of pasture, and works this engine only 14 days a year in cultivation, and not more in threshing, employs regularly throughout the year seven men and four boys, equal to nine men upon the whole, or one to every 12 acres of arable land and eight of grass—“more than any farmer in the neighbourhood employs.” His steam cultivation costs him on the average 10s. 10d. annually per acre on his clays, and 8s. 3d. annually per acre on his lighter soil. It has displaced exactly 2-5ths of the former horse-power; and he says that 70 per cent. of the cost of engine work is manual labour and only 30 per cent. engine food, while of the horse work displaced only 20 per cent. is manual labour and 80 per cent. is horse food. Mr. Morton accumulates a large mass of facts of a similar tendency. “Agriculture is, in fact, experiencing the truth taught in the history of all other manufactures—that machinery is, in the long run, the best friend of the labourer. This truth is taught even more impressively by a review of agriculture generally, than it is by the case of any individual farm.”

The statistics which Mr. Morton has brought together to illustrate the extent to which agricultural machinery is coming into use are most impressive. He has had returns sent to him by all the leading manufacturers of steam-engines for agricultural purposes. Within the past ten years upwards of 40,000 horse-power has been added to the forces used in agriculture in steam alone. Messrs. Clayton and Shuttleworth of Lincoln, Garrett of Saxmundham, Hornsby of Grantham, Ransome of Ipswich, and Tuxford of Boston, alone are furnishing 10,000 horse-power annually to the farmer. Messrs. Tuxford—among the first to start the locomotive agricultural steam-engine—informed him that for the earliest suggestion of it they are indebted to Mr. John Morton, of Gloucestershire, then agent to the late Earl of Ducie, who twenty years ago recommended them to put these little engines upon wheels, thus foreseeing the fitness of these powers made locomotive to the circumstances of English agriculture. Messrs. Ransome, of Ipswich, were the earliest to receive the commendations and the prizes of the Agricultural Society of England for their engines, and now the leading manufacturers of them, Messrs. Clayton, of Lincoln, send out 10 of them each week, or 4,000 horse-power per annum. Of reapers, again, since 1851, Burgess and Key have sold upwards of 1,900 of their improved McCormick's reaper, of which 771 were sold last year; and they now hold four times as many orders as they did twelve months ago. Crosskill's have sold 500 of Bell's reaper, and 800 of Hussey's; Messrs. Dray have sold 800 of their improved Hussey's reaper; Messrs. Garrett have sold 600 of Hussey's; 250 of Wood's clever little reaper

were sold last year, and the Cuthberts, of Bedale, who have just begun the manufacture of their equally clever machine, sold 100 before last harvest, and could have sold four times as many. In all, probably 4,000 reaping machines were at work last harvest, capable of cutting more in a day than 40,000 labouring men, and yet there never was such a harvest as the last for the difficulty of procuring harvest men. Yet, notwithstanding all this addition to the forces and the machinery of agriculture, more labourers than ever are required, and as more labourers are not forthcoming, wages rise, as Mr. Morton shows by an array of unquestionable facts.

THE CASE OF HENRY CORT, AND HIS INVENTIONS IN THE MANUFACTURE OF BRITISH IRON.

BY
THOMAS WEBSTER, M.A., F.R.S., &c., Barrister-at-Law.
XI.

“THE sanguine hopes” entertained by Mr. Dundas of Cort's inventions becoming productive were of course much heightened by the successful commencement, early in 1789, of the colossal forges and mills, which had been two years in progress at Cyfartha, Penydarran, Dowlais, &c., &c., under the superintendence and instruction of Henry Cort and his workmen, and the letters written to Cort by Sir Jeremiah Homfray, a man of honour (the predecessor of his brother, Samuel Homfray, in the management of the Penydarran), in Feb., 1789, and from Mr. Cockshutt, the resident and experienced managing partner at Cyfartha, describing the very successful commencement of Cort's process at all these works, and in which they had proceeded so well as to be able in the summer to take the Government contracts for iron, previously supplied from Cort's works at Fontley. Soon after (as ascertained by the Naval Commission), that is, on the 13th Aug., 1789, some proposals were made to Adam Jellicoe by the Treasurer and Paymaster respecting an extent upon Cort's premises for Jellicoe's default. But however unfortunately Jellicoe may have been led into appropriating public money, under a system which appears from his melancholy letter, and from the general inquiries of the Commissioners, to have been at that time the “official routine,” yet he had the reputation of being otherwise an honourable character. He appears, therefore, to have felt deeply any proposal to ruin Henry Cort, whom he had deceived in common with others, who believed him to have large private property, out of which he was supposed to be finding money for the iron-works as a provision for his son. And it is very doubtful if Mr. Dundas could or would have dared to proceed to extreme measures while Adam Jellicoe lived. It was ascertained by the Commissioners that when Mr. Dundas required money he procured Mr. Jellicoe to draw cheques as if for naval service, and appropriated the proceeds to his private purposes. Two of these cheques were identified, one for £10,000 in 1782, during the first Treasurership of Mr. Dundas, and a second for £20,000 in 1785, during his next term of office. It is a singular coincidence, and it may be nothing more, that these two sums so nearly approach and cover the sum of £27,500, sworn to as the default of Jellicoe, for which Cort was made answerable; but nothing is more possible than that the advances to Cort were made by the principals of the office, who so well knew the value of the patents. However this may be, it is clear that Jellicoe could not easily have escaped ruin by recrimination. Mr. Dundas

was in a position to have effectually stifled the recriminations of a defaulting subordinate; and it appears he continued to press upon Jellicoe the necessity of making good his deficiency, for on the 29th of August, sixteen days after the first proposal of an extent, an accountant was called in, and a schedule of Adam Jellicoe's effects drawn by him was found by the Commissioners, estimating the whole, including Cort's property, at £89,657. It should be particularly noticed that the patent contracts, which were considered to be of such value as to induce Mr. Dundas to countenance, as he states, the diversion of nearly £30,000 of public money upon "sanguine hopes" of their productiveness, and for securing which he anticipated a parliamentary reward, are set down at £100 only; so that the value of Jellicoe's estate was not swelled by any sanguine estimate on this head. The day after this schedule was made, Adam Jellicoe died by his own hand—a very singular circumstance, when coupled with his references to sudden death in the melancholy memorandum already stated. It is clear he would not countenance, and he could not live in the disgrace of witnessing, the execution of the nefarious designs of his superiors against his confiding and deceived friend. Mr. Trotter lost no time in a prolonged mourning for the decease of his senior, under whom, before 1782, he commenced his official career as a clerk at £60 a year, thence promoted by Mr. Dundas to be his useful Paymaster, over the head of an officer who had risen through forty-two years of service, and had been Deputy-Paymaster since 1777. On the 1st of Sept., only three days after the sad event, he performed the necessary swearing at a convenient distance from London, adding, to make the document complete, that Henry Cort—who was executing a contract with the Navy Board, from which the oath proceeded, for 450 tons of iron, value at the foreign price over £15,000, and upon which for what had been executed he held more than £4,000 of Navy Bills; and who in addition, as was equally well known to Mr. Trotter, had patent dues of £15,000 per annum coming in to him, without the least difficulty or dispute—"is, as he verily believes, much decayed in his credit, and in very embarrassed circumstances."

The premises at Fontley, Fareham, and Gosport, stock-in-trade, good-will, Navy bills, &c., &c., were valued at £39,452, and Samuel Jellicoe was put into possession of them by Mr. Trotter. In 1800, when this method of realizing public property for eleven years had left, as Lord Melville states in his memorial, £24,846 of Samuel's father's default unliquidated, out of effects valued at £89,657, the Treasurer's own default on quitting office that year, as nearly as could be estimated in 1803 by the Commissioners in the absence of documents, exceeded £193,000; and during the whole term of office he had retained yearly balances of public money averaging £600,000 for his private emolument.

It may even yet come to light how much he received as the price of not enforcing the patent contracts against the ironmasters. These patents and contracts disappeared, and have not yet been found. Where are they?

A return from the Navy Office of all iron supplied for naval service, and by whom, from 1782 to 1800 inclusive, will show who were the first to benefit by the ruin of Henry Cort.

In July, 1791, the following reply was received from the Navy Board to a letter addressed to it by Henry Cort:—

"SIR,—The Commissioners of the Navy have received your letter of the 4th instant,

and I have it in charge from them to acquaint you that your invention appears of that utility as to induce them to give encouragement to the manufacture of British iron, performed according to the methods that have been practised by you.

"I am, Sir,

"Your most humble servant,

"JNO. MORRISON, Secretary.

"Mr. Cort, Devonshire-street, Queen's-square."

This condescending testimonial to a value that was undeniable is, indeed, a singular piece of cold-hearted equivocation and mockery. Mr. Cort's object was of course to call attention to his own claims. The Secretary reminds him that the methods which have been practised by him and others are now to be encouraged.

The ordinary device of setting up of the rival claims of others was a sufficient indication of the course intended to be pursued. The real point is evaded, and Mr. Cort is left to the hopeless task of fighting with interested officials backed by a public purse, and in possession of the patents, the only title by which he could enforce his legal rights.

In 1794, after three years more of such cruel and, under all the circumstances, infamous neglect, the following appeal was addressed to the Prime Minister, the Right Honourable Wm. Pitt:—

"SIR,—We take the liberty respectfully to state to you the unfortunate case of Mr. Henry Cort, late of Gosport, at which place he had, some time ago, iron contracts under Government, and among the rest a contract for making malleable iron with raw pit-coal only, and manufacturing the same by means of grooved rollers by a process of his own invention; we are sorry to add that, through the very great expenses necessarily attending the prosecution of these important instruments, this gentleman failed, when on the very eve of reaping the harvest of his patents, which were taken possession of under extents from the Crown.

"We have therefore been induced, not only from compassion, but from the good opinion we entertain of him, and from the great national benefits which now actually result from these his discoveries and improvements, to join with many others in a subscription to afford some temporary relief to him and his destitute family, consisting of his wife and twelve children, (nine of whom are wholly unprovided for, only one able to maintain himself). This, however, cannot possibly produce any other effect than merely to supply his present urgent necessities, without rescuing him from that state of poverty and ruin to which we are very sorry to find his meritorious exertions have reduced him; a circumstance which will appear the more unfortunate, when it is considered that the same pursuits have been attended with the greatest success and profit to others, who, availing themselves of his experience, have enjoyed all the advantages without encountering the labour and difficulties ever inseparable from the first practice of any new process.

"From these considerations we beg leave, Sir, to recommend Mr. Cort to your notice in the strongest manner we are able, as deserving of such encouragement from Government as may be thought most expedient, either by an appointment in some situation in one of His Majesty's Dockyards, the Customs, Excise, or any other office or place in which his talents and industry may prove useful to the public and himself. In any of which departments we will confidently engage that Mr. Cort's abilities and conduct will be such as by no means to discredit our recommendation, or any other

countenance which you, Sir, may have the goodness to show him at our instance.

"We have the honour to be, &c., &c.,

(Mr. Brook Watson undertook to deliver this letter to Mr. Pitt.)

This appeal obtained Mr. Cort a pension of nominally £200 a-year, actual receipts about £150. It would have been more to the honour of the Minister to have restored to their owner his patents, then producing £25,000 a-year, than to tax the public purse even to the extent of this paltry pension. The impenetrable mysteries of office were not pierced by Mr. Henry Cort; he was ruined, but does not appear to have known why. The transactions of Messrs. Dundas and Trotter were very secret; sixteen years afterwards they burst like a thunder-clap on the public ear. Their contract with certain men to annul the patent claims had been snugly made, and the *quid pro quo* received, and the whole affair managed so cautiously, that the fact of H. Cort's ruin having been a great State secret has only recently been disclosed. A pension during pleasure was the best step to hinder disagreeable inquiries into the title of the son of a defaulter to all his possessions in Hampshire. In 1800 Cort, after witnessing the expiration of his second patent for rolling, died a memorable victim to official delinquency. £125 was then extended to his widow, net receipt £100, as stated in the petition to the iron trade. On her decease in 1816 pensions of £25 6s. each were granted to two unmarried daughters, subject to deduction, the amount of which is estimated at not less than £500.

The journals of the House of Commons record the following remarkable facts in connection with the foregoing—

"House of Commons,
Impeachment of Henry Viscount Melville,
1805,

Present, 433 Members, including the Speaker;

217 for Impeachment,

216 for Criminal Prosecution.

Extract from 6th Article.

Burning of Books and Papers.

"That during the time the said Alexander Trotter held and enjoyed the said office of Paymaster to the said Henry Lord Viscount Melville as aforesaid, and whilst the said Henry Lord Viscount Melville held and enjoyed the said office as Treasurer of the Navy as aforesaid, he the said Alexander Trotter kept with the said Henry Lord Viscount Melville an account current entered in certain books of account, containing entries of all the sums paid and received by the said Alexander Trotter in the account of the said Henry Lord Viscount Melville: and by agreement between the said Henry Lord Viscount Melville and the said Alexander Trotter, bearing date the 18th and 23rd February, 1803, it is stated that they had either mutually delivered up to each other, or resolved and agreed mutually to cancel or destroy, all the vouchers or other memorandums and writings that any time theretofore might have existed, passed, or been

interchanged between them relative to the said accounts, and the different items and articles of which the said accounts were composed or constituted, and the said books of account containing the said account current, together with all vouchers, with other memorandums and writings in possession of the said Alexander Trotter, and also of the said Henry Lord Viscount Melville, relative thereto, were burnt or destroyed by the said Henry Lord Viscount Melville and Alexander Trotter; and the said stipulations contained in the said agreement for the said Henry Lord Viscount Melville mutually delivering up to each other, or for mutually concealing and destroying, all the said vouchers or other memorandums or writings relative to the said accounts was so entered into, and the said books and accounts, vouchers, and memorandums, and writings were so burnt and destroyed, with a view to conceal and prevent the discovery of the several advances of money made by the said Alexander Trotter to the said Henry Lord Viscount Melville, and of the several accounts and considerations for or upon which the sums were advanced."

The facts as stated in the above article were not disputed, but the conduct of Henry Lord Viscount Melville was declared by a majority of 88 over 47 Peers (the impeached commanding as it was supposed 40 proxies) not to be "a high crime and misdemeanour." The acts of the accessories to the transactions were declared to be inadvertent; the most glaring inconsistencies and forgetfulness occurred in the evidence of implicated parties.* The solicitor employed to issue the extent stated, that he did not consider it his duty to see that the annual payments from Cort's estate in the possession of his late partner Samuel Jellicoe were regularly discharged, conceiving that duty to rest with Mr. Trotter, who also excused himself on the plea of ignorance from all knowledge of the matters as to which he was interrogated.

Thus was Cort deprived of all his property; no one took any part in the matter, or could recollect what part they had taken or permitted to be taken; no one knew what had become of patents under which property to the amount of £200,000 might have been realized. Lord Melville, after having enjoyed possession for eleven years of freeholds and patents of ten times the value of the alleged default, obtains a further grant of £24,846 of public money after the death of Henry Cort, being discharged of this sum as the balance of the debt remaining due to the Crown by Cort and Jellicoe. The evidence of Samuel Jellicoe in 1803 is as follows:

"An extent was issued against the firm of Henry Cort and Samuel Jellicoe. Upon my being put solely in possession of the trade and effects, I engaged to pay all the debts of the firm, which I have done." If this be true, and no doubt it is, the trade being very lucrative, why were Cort's patents retained and withheld by the Treasurer from their rightful owner? The alleged default had been repaid twice over, once out of Cort's estate, and again to the amount of £24,846 out of the public taxes. The only actual result of this impeachment was, as usual, the punishment of the minor offender, Mr. Trotter being dismissed his office.

Well might Mr. Fox, in his speech on the 10th of April, 1805, remark, "The House may depend upon it the question will be a subject of consideration out of doors for a long period, and be agitated over and over again."

The present Marquis of Landsdowne, then Lord Henry Petty, was eloquent on the stigma affixed by these acts to the British Peerage.†

THE SMITHFIELD CLUB IMPLEMENT SHOW.

GREAT pressure upon our space has prevented our noticing in detail the exhibition of implements in the Smithfield Club Show until the issue of our present number, in which we shall endeavour to give a short but accurate statement of what few novelties presented themselves to us while examining this important although subsidiary portion of the long-looked for Christmas gathering together of cattle and implements, showing the progress of the preceding six months. In drawing attention, however, to what may be termed the novelties of the show, we labour under disadvantages unknown to those writing for the information or amusement of the general public, inasmuch as we unfortunately know that the greater part, if not the whole, of these "novelties" are no novelties at all, except in respect to the Show itself, and to some portion of those who visit it; the generality of the schemes having, in all probability, been before both us and our readers, at least upon paper, perhaps, for many months, and in some cases for years. Notwithstanding this, however, the appearance of an implement at the Smithfield Club Show is interesting even to those who knew of its previous existence, for it may be pretty generally assumed that it has, prior to its exhibition, known the test of experience to some extent at least, and has become one of the wants of the agriculturist. It is not easy at any time to invent an entirely new machine, or even to invent one which shall perform a similar operation to those already in use in an entirely new way; this latter is, however, very much more frequently accomplished than the former, although the utility of any great variety of machines for doing the same thing is somewhat questionable. At least it is quite certain that if three-fourths of the manufacturers of the almost endless varieties of root pulpers and chaff cutters of the present day were to receive forthwith a friendly "advertisement" or recommendation to desist from making their specialties, British agriculture would not be in quite a hopeless condition. Indeed, we feel sure that farmers in that case would save a vast deal of time now very unprofitably spent in ruminating upon what particular machine to buy. Besides the variety of machines for performing the same operation, there are also a great variety for differently treating the same substance. Take, for example, that favourite root the "sweed." Into what forms has it not been cut, torn, or ground? One machine slices it like pancakes, another cuts it into long square bars or fingers, a third makes it into veritable pills, and a fourth reduces it into shavings. Whether or not all these forms are absolutely necessary, in order to suit the more than epicurean tastes of fastidious swine, we cannot venture to say, but their production is sufficient evidence of the difficulty of anything new being done in turnip cutting. It may be that the difficulty of getting even pigs (whilst undergoing the finishing process for the Show) to eat at all when so required, has been so great as to have suggested the idea that in the event of a homely slice of turnip being refused, the offer of a delicate finger would be more acceptable; or failing this, a still more delicate pill or shaving would be irresistible. If this be so, these varieties of forms are doubtless highly scientific, though after all only suggestive of still greater refinements for the saving of unnecessary labour in the way of mastication. A machine could be devised for removing the sharp angles from the fingers before-alluded to, or one for fairly *masking* turnips combined with a force pump might find favour, and would constitute the *multum in parvo* of pig-filling machines.

The greatest novelty of the show was perhaps Marriott's Canadian revolving harrow, manufactured by Samuelson, of Banbury. This implement consists of two or more separate systems of horizontal rings which continually revolve as they are drawn over the ground, thus relieving themselves from weeds, &c., and so lessening the power required to work them; the paths of the

times of these implements not travelling in parallel lines, but forming curves crossing one another, makes these machines more effectual than the common harrow. Few trials have as yet been made, but the arrangement is very ingenious and deserves fair testing. We next notice a new root pulper patented by Mr. Lambert and manufactured by the Trustees of Mr. Crosskill, of Beverley. These machines are made for hand and power, and consist of a cast iron cone, into which hooked knives are fitted which work against a ribbed fence. They are certainly very simple, and are said to pulp faster than any other machines, but this we cannot vouch for, and indeed we think it very unlikely to be the case. Messrs. Goss and Peene's improved root grater also deserves special notice, although it has been out for, we believe, nearly three years, though never exhibited at the shows. It consists of a cast metal ring (which acts as a fly-wheel) having a flat plate attached to it with cutters formed therein in the usual way of this class of machine. It is very cheap and appears to be very effective. Romaine's patent portable railway, a model of which was exhibited, although not new, having been shown at Warwick, yet deserves a passing remark. In this apparatus each bearing wheel is made double, the two halves being fixed a few inches apart and having separate systems of shoes, as in Roydell's plan, but so arranged as that the *centre* of each shoe in one system should bear the weight when the ends of the shoes on the second system are in use. This prevents the ends getting embedded in the ground, and increases the bearing surface. Hornsby's patent plough also claims our attention here, although brought out at the Warwick meeting. These ploughs have the share, turnfurrow, or breast, attached to the slide or sole plate, instead of to the frame as usual. By this mode of construction the heavy handles and frame are solid pieces of wrought iron, very light and very strong. The draught of these implements appears very light, and seems to have astonished those who have witnessed them in operation.

Mulgrave Brothers, of Belfast, were new exhibitors in London, and showed an excellent assortment of railings, grates, stable fittings, wire-work, standards for corn, rick stands, &c., all of which appeared of the best workmanship, and very moderate in price. Edward Palmer and Son, of Thetford, exhibited a new chaff engine in which the cutting blades, instead of being curved and attached to the arms of the fly wheel, are made quite straight, and attached to the fly-wheel shaft. These blades as they rotate pass a fixed cutter placed at the end of the feeding trough, and so cut the hay like a pair of shears; the revolving blades being fixed at an angle, the cutting commences at the lower ends, and progresses, as it were, along the edges. A machine with three knives, 15 inches long, has cut a truss of hay in less than two-and-a-half-minutes. Hancock's washing machine is comparatively a new machine, and consists of a case containing rollers carrying an endless band, upon which the clothes are laid, and upon which latter rest loose wooden rollers or discs, which are free to move both vertically or horizontally, so as to allow the clothes to pass under them. The only other matters we can notice are the brick-making machine of H. Clayton and Co., and the model of Fowler's steam-ploughing apparatus. The former, however, having been fully described in our pages a fortnight since, and Mr. Fowler's system some months ago, we need not now recapitulate what we have already said. Mr. Fowler is making good progress, as he deserves to do, in steam-ploughing, and publishes, with his present catalogue of prices, a very imposing list of testimonials of the advantages of using steam in place of horse-power, and the saving effected thereby.

With regard to the future site of the show, it appears that for the next two years little, if any, change can be made from the existing arrangements, but the committee are now earnestly at work seeking a fitting place to hold the Christmas shows, where ample space may be had for both

cattle and implements. The corporation of the City of London would doubtless like the shows to be held in Smithfield itself; others, again, would locate them at Islington; some at the Crystal Palace, and some at Kensington. The general impression seems to be in favour of a movement westward, but we fear many objections will be made to the desecration of Kensington. How far ample space, good air and light, and, moreover, aristocratic "surroundings" might tend to improve the cattle show, we do not know, but unless about nine-tenths of the dirt and confusion at present experienced could be prevented, Kensington will be up in arms at the thought of bringing the Christmas shows there. There can be little doubt, however, that room exists for a suitable building which might answer for all sorts of flower, fruit, and poultry shows, as well as for a winter garden and the cattle shows, and no place seems better than Kensington for most, if not for all, of these purposes. With care and good management we think a cattle show would be endurable at Kensington, but care and good management would be absolutely necessary in order to make it so, and it will be well worth the committee's while, should they think of this site, to lay down their plans somewhat in detail in order to avoid needless opposition. The same building might also serve the purpose of the proposed exhibition of 1882, and any that may succeed it. It might also form an admirable place for rifle practice, and the annual gatherings contemplated by the Association for Promoting Rifle Corps, at which the promoters appear to hope as much as £10,000 a-year will be distributed in prizes.

ON THE WEIGHT AND STRENGTH OF AMERICAN SHIP-TIMBER.

By DONALD MCKAY, Ship-builder, of Boston, U.S.
WEIGHT OF A CUBIC FOOT OF

	Virginia White Oak.		Virginia Yell. Pine.*	
	Round.	Square.	Round.	Square.
After felling...	lbs. 64.74	lbs. 67.20	lbs. 47.81	lbs. 39.21
1 Year after...	53.60	53.51	39.83	34.16
4 Years after...	45.97	49.89	34.28	33.49

Each of the above numbers are the mean of experiments on twelve different pieces of timber cut from different trees, and the experiments were made by Mr. Farris, Timber Inspector of Gosport Navy-yard.

WEIGHT OF A CUBIC FOOT OF LIVE OAK, ACCORDING TO GRIFFITH.

Green..... 78.69 lbs. | Seasoned..... 66.75 lbs.

This timber is exclusively used for the frames of the United States' men-of-war ships, and is considered by all naval men to be almost imperishable.

TENSILE STRENGTH OF AMERICAN WHITE OAK AND ENGLISH OAK PER ONE SQUARE INCH.

(From "Appleton's Dictionary of Mechanics.")

	lbs.	lbs.
English Oak	8820	10,224
American White Oak	11,501	

SPECIFIC GRAVITY AND TRANSVERSE STRENGTH (PER ONE SQUARE INCH) OF ENGLISH OAK AND AMERICAN WHITE AND LIVE OAK.

(According to Various Observers.)

Extracted from a Table published in Vol. V. of the Professional Papers of the Royal Engineers.

Name of Observer.	English Oak.		American White Oak.		American Live Oak.	
	Sp.gr.	Strgh.	Sp.gr.	Strgh.	Sp.gr.	Strgh.
Lieut Nelson	834	1629	645	1699	1160	1862
Mr. Moore	816	1919	836	1699		
Mr. Barlow	934	1672	872	1766		
Lieut. Dennison ..	793	1356	772	1809		
Mean results ...	829	1694	781	1743	1160	1862

According to these experiments, the advantage of lightness, combined with strength, is entirely on the side of American White Oak.

* The Virginia Pitch Pine is called in America "Yellow Pine." The Florida Yellow Pine is called the "Long-leaf Yellow Pine," and weighs about 41 lbs. per cubic foot.

CAPTAIN TOOVEY'S AZIMUTH DIAL.

CAPTAIN SMALLMAN TOOVEY, of the mercantile marine—a gentleman who has had considerable experience in charge of iron ships, and well understands the necessity of testing the compasses of such vessels with all possible frequency and care—has introduced a valuable instrument for facilitating this operation. The accompanying engraving represents the improved instrument, which has already been employed on several voyages with the greatest satisfaction, and is now supplied to the navy by Messrs. Murray, Son, & Co. of the Minories. It is manufactured in cheap as well as high-priced forms, in order that no captain may have difficulty in obtaining it. The origin and nature of the instrument are as follows:—It occurred to Captain Toovey that it would be more convenient, when determining the error of the compass by the use of the dumb-card, if both the amount of error and its direction, i. e. the course by ship's head and the true course, were shown on the same card: he was thus led to adopt a modification of the dumb-card, which he calls the Azimuth Dial. The instrument consists of a double disc of metal (sometimes silvered), swinging freely on a tripod, and is of sufficient weight to be always horizontal, whatever may be the list of the ship. The outer rim of the disc is graduated to the points (or degrees) of the compass, and turning on the same centre is a second disc similarly graduated. There is a small pointer for indicating the direction of the ship's head: and it is also fitted with a style for obtaining the sun's shadow, but this can be removed, and the ordinary telescope and sight-vane applied in the usual mode of taking an azimuth of an object. The instrument is used thus:—By the use of Godfrey's time azimuth chart, the true bearing of a celestial object can be determined at any moment, when its meridian distance is more than two hours and less than six hours. Thus, within those intervals, the points of the true horizon are known for any given instant. Having placed the azimuth dial in a convenient part of the ship for making an observation, fix the instrument so that the pointer may be on the line of the keel and towards the ship's head; set the inner and outer graduated disc so that their difference may show the amount of variation as known at the place, such that the inner disc may indicate the true and the outer disc the magnetic horizon, then turn the dial on its axis until the shadow from the style on the inner disc coincides with the sun's true bearing at the time as given by Godfrey's chart; the pointer will then also show the magnetic position of the ship's head on the outer graduated disc and the true on the inner disc. If

the compass in the binnacle differs from the reading on the outer disc, the difference is the deviation of the compass on that point. In the same manner the error of the compass may be determined for any number of points. It can also be used to determine the error of the compass from the bearing of any distant object the correct position of which is known.

POOLE'S PARALLEL-MOTION SAFETY VALVE.

AFTER the meeting of the Institution of Civil Engineers, Nov., 22, Mr. John Poole exhibited and explained a "Parallel-Motion Safety Valve."

It was pointed out that the ordinary valve simply rested on its face or seat; its vertical or upward motion being guided by a spindle on the lower side passing through a box or feathers in the steam pipe. The area of the discharge pipe was thus reduced one-third, and in some cases as much as one-half. This valve was pressed upon by a weighted lever, moving on a hinge or centre on one side. When in a state of rest, the lever and the centre of the spindle were at right angles to each other; but as soon as the valve rose the angle became more acute. This brought an unequal load upon the valve, and caused friction, inducing a tendency in the spindle to twist and on the valve to jam or stick. The guide spindle, being below the valve face, was also liable to be corroded by foul or dirty water, and to unequal contraction and expansion. It was likewise found that these valves, when out of order, invariably leaked on the side nearest the hinge of the lever.

In the "Parallel-Motion Safety Valve" the spindle was on the upper side, the seat or face was flat, and the discharge pipe was free of interior incumbrances, so that less leverage and weight were necessary. The spindle passed through a guide above, and to the centre of the spindle, on which the valve was hinged, the parallel motion was attached. It was shown, by a sectional model, that the radial action of the lever did not control the vertical action of the valve, which therefore could not stick or jam in its seat.

Proceedings of Societies.

SOCIETY OF ARTS.

December 7th, 1859.—The fourth ordinary meeting of this session was held, at Burlington-house, Esq., F.R.S., in the chair. Several candidates were balloted for and duly elected members. "The paper read was "On the Forces used in Agriculture," by J. C. Morton, a lengthy notice of which appears on another page.

ROYAL GEOGRAPHICAL SOCIETY.

A numerous attended meeting of this society was held on Monday evening, at Burlington-house, Sir Roderick I. Murchison, Vice-President, in the Chair. Captain H. Godfrey-Austen, the Hon. and Rev. F. S. Grimston, F. W. Davis, M.D., R.N., H. Harwood Harwood, W. H. Purdon, and Francis Tagart, Esqs., were presented upon their election. Captain G. Augustus Bedford, R.N., Rear-Admiral Sir H. Byam Martin, K.C.B., Henry Ansell, Edward Butler, Edmund Calvert, William C. Hood, M.D., Henry Raikes, M.A., Edward Smith, W. Castle Smith, Richard Todd, and James Watson, Esquires, were elected Fellows. Sir Andrew Agnew, Bart., M.P., Captain Claude Clerk, the Hon. W. H. Forester Denison, Captain J. Hamilton Ward, R.N., Edward Enfield, H. Hamilton Lindsay, Charles Otter, and J. Petherick, Vice-Consul at Khartum, Esquires, were proposed as candidates for election. The MS. trigonometrical survey of Kashmir, by Captain T. G. Montgomerie, F.R.G.S., under the direction of Lieutenant-Colonel A. Scott Waugh, F.R.G.S., Surveyor-General of India; sketches illustrative of Himalayan scenery, by Captain Austen and Mr. Purdon; Numerous sketches of scenery in British Columbia, including San Juan Island, &c., by Mr. Bedwell, R.N.; a map of the Fraser River, by Captain G. H. Richard, R.N., F.R.G.S., Her Majesty's Ship Plumper; a plan of the Tien-tsin-lo, showing the Chinese defences, by Major Fisher, R.E.; and a model of the largest gold nugget hitherto found, from Ballarat, by Professor Tennant, F.R.G.S., were exhibited to the meeting.

The papers read were:—

1. On the trigonometrical survey and physical configuration of the valley of Kashmir, by Mr. William Purdon, F.R.G.S., executive engineer, Punjab; communicated by Sir Charles Wood, F.R.G.S., India Office.

Prior to commencing the above paper, the Chairman read a letter from Lord Canning, expressing his approbation of the map of Kashmir, and alluding to the peculiar difficulties against which the officers of the survey had to contend, not only from the nature of the country itself but from the disposition of the inhabitants who were at that time strongly opposed to the British rule, and the men employed under the engineer officers were sepoys belonging to one of the regiments that had been first to revolt. Owing, however, to the skilful management and courageous conduct of Captain Montgomerie, the men had been retained in obedience and confirmed in their loyalty. The map which was the result of the survey was exhibited, and appeared to illustrate the description of the valley of Kashmir given Mr. Purdon's paper. The paper gave rise to a discussion, in which Colonel Everest, the former Surveyor-General of India, Captain Austen, of the Staff of the Great Trigonometrical Survey, and others, took part.

2. British Columbia. Journeys in the Districts bordering on the Fraser, Thompson, and Harrison Rivers. By Lieutenants Mayne, R.N., and Palmer, R.E., and Chief Justice M. Begbie. Communicated by the Duke of Newcastle, Colonial Office. —Lieutenant Mayne's report contains much interesting topographical information. It describes the character of the soil, the vegetation, and productions of the districts traversed, and points out the courses of the rivers and the general geographical features of the country. Lieutenant Palmer, in his paper, remarks that every miner admitted the existence of gold in the Upper Fraser River; and but for the scarcity and enormous

price of provisions, there would be abundant work for those who were quitting the country. Dry diggings have yet to be found, which would be done when men possessed energy enough to prospect the country. But while provisions held such an enormous price, there could be no hope that any active exertions could be made. The Chief Justice Begbie, in his communication, observes that two chiefs, said to be of extensive authority, paid him a visit while at Cayoosh, and complained of the conduct of the citizens of the United States in preventing them from mining, in destroying and carrying away their root crops without compensation, and in laying wholly upon the Indians many depredations on cattle and horses, which, these Indians informed him were, in part at least, committed by Boston men. On the other hand, there were many cases of cattle stealing alleged by the whites of all nations against the Indians, and stealing of anything that could by possibility be eaten. The cattle which the Indians stole they did not attempt to sell or make use of otherwise than as food; and it was admitted on all hands that many hundreds of Indians had died of absolute starvation during the winter. The Indians said that the salmon had failed them now for three years together. The whites alleged what was obvious to everybody—that the Indians were extremely averse to work, except under the pressure of immediate hunger, and that they were so improvident as rarely to look beyond the wants of the day, or to provide for the winter. The Chief Justice expresses an opinion that this was more true of the savages who had never been brought into contact with civilisation than of those who had had even such a little acquaintance with the whites. He found almost everywhere Indians willing to labour hard for hire, and bargaining acutely for wages, and perfectly acquainted with gold dust and the minute weights for measuring one and two dollars with. These circumstances were inconsistent with an utter heedlessness for next day's provisions; for in all cases it was necessary to find these Indians in provisions as well as wages. The amount of wages for carrying burdens was 8s. per day, and provisions everywhere showed a high rate of profit as the wages of labour in British Columbia. If this was the average remuneration of the most unskilled labour, what would not skilled labour supported by capital earn? It was the uniform practice of those keepers to entrust these Indians with their goods, generally 100 lbs. of flour, beans, or pork, and provisions for their own subsistence. Thefts were said to be unknown, and great care taken of their burdens. The individuals who worked were found extremely fleshy and healthy. His impression of the Indian population was, that they had far more natural intelligence, honesty, and good manners than the lowest classes, such as the agricultural and mining population, of any European country he had ever visited, England included. At Cayoosh he tried to cause a grand jury to be summoned to present all these matters formally to him. But there were not twelve British subjects there. The Chief Justice says the chief points which struck him were, first, the ready submission of a foreign population to the declaration of the will of the executive, when expressed clearly and discreetly, however contrary to their wishes; secondly, the great preponderance of the California, or Californised element of the population, and the paucity of British subjects; thirdly, the great riches, both auriferous and agricultural, of the country; fourthly, the great want of some fixity of tenure for agricultural purposes; and, fifthly, the absence of all means of communication, except by foaming torrents in canoes, or over goat tracks on foot, which rendered all the productions of the country, except such as, like gold, could be carried with great care in small weight and compass, practically valueless.

The Chairman, in proposing the thanks of the Society to His Grace the Duke of Newcastle for sending the papers, and also to those gentlemen who had prepared them, said that he was much struck with the fact that vessels of large tonnage

could navigate all the rivers, thus affording access to the auriferous regions. He was glad to see young officers of the Navy employed in examining those distant regions of the British Empire.

MEETINGS FOR THE ENSUING WEEK.

Mon.—*London Inst.*, "On the Radiation and Absorption of Heat," by Prof. John Tyndall, F.R.S., at 7 p.m.

Wed.—*Society of Arts*, "On Starches; the Purposes for which they are Employed, and the Improvements in their Manufacture," by Mr. F. Crace Calvert, F.R.S., at 8 p.m.

London Inst., Soiree.

Thurs.—*Royal Society*, at 8 p.m.

Fri.—*London Inst.*, "On Certain Principles of Vegetable and Animal Chemistry," by F. A. Malone, Esq., F.C.S., at 7 p.m.

GRAVELEY'S PATENT IMPROVED DISTILLING AND COOKING APPARATUS.

DISTILLING and cooking apparatuses for use on board ship are now so universally in request that their manufacture has become a matter of much importance to shipowners. We are anxious, therefore, to place before our readers a set of apparatuses recently devised by Mr. Graveley, of the well-known firm of Winchester and Co., Upper East Smithfield, manufacturers of ship fire-hearths, &c., for the marine of this and other countries. Mr. Graveley and the firm mentioned have had the advantage of very great experience in connection with this subject, and have introduced apparatuses for distilling and cooking which certainly are not surpassed, to say the least, by any others. Those supplied by them for the Great Eastern, the General Admiral (Russian frigate), and other important vessels, many of them men-of-war, are among the best examples of this class of articles to be found on shipboard.

Their latest improvements, which we now propose to illustrate and describe, have done a very great deal towards perfecting apparatuses for distilling and cooking on board ship, leaving little to be desired in respect of either efficiency, economy, or compactness. The first apparatus which we shall describe consists of a furnace with the ordinary appliances for cooking, roasting, and baking, and of one or two steam boilers arranged and acting as hereafter described. The same fuel and furnace perform all the operations. One boiler is similar to an ordinary tubular boiler; the patentee divides the steam chest or dome into two compartments by a partially perforated plate to prevent any undue pressure of steam coming too suddenly in contact with the steam-pipe leading from the dome. Inside the lower compartment he places a small dome perforated to a given height up the sides. Inside this small dome is a globular valve provided with a proper seating, into which seating a pipe opens. This pipe is intended to carry off any salt water that may arise with the steam; the globular valve is enclosed to ensure its not being held down on its seat by the pressure of the steam in the chest.

He encases the above-named steam-boiler in an air tube to prevent loss of heat by radiation, and outside of the air tube is fixed another boiler containing a quantity of tubes in connection with steam-pipes from the chest of the internal boiler for the purpose of boiling sea water. Atmospheric air is admitted to airate and mix with the steam from the first steam-chest after the same has entered the tubes in the second boiler, and force or drive in the air by a jet of steam. On the second boiler is another steam chest or dome divided into two compartments and fitted with a globular valve as in the dome first mentioned. A steam-pipe leads from the top of this dome, and an orifice is made in the side of the dome for the admission of atmospheric air, and introduces a jet of steam from the first-named steam-chest to draw the air in. The steam-pipe from the last-named dome leads to a small cistern or box containing fresh water, in which the steam from both the boilers is first received and becomes condensed. The water from this box then passes through a condenser and filter in connection with it, and is discharged from the filter in the state of pure

rails are fitted to the guard which are intended to support saucepans or other cooking utensils, and to prevent them from rolling off or shifting. *J J* are steamers of the ordinary construction fitted or placed at the top of the apparatus; *K* is a boiler the water in which is heated by the products of combustion passing through flues *L L*. *M* is a dome at the upper part of which a safety valve is fitted, and which has a tube placed inside the dome and extending to nearly the top thereof. The steam which is generated in the boiler passes up this tube and descends between the tube and the dome *N*, surrounding the cooking boilers *O O* (as indicated by the arrows). The flues *L L* are in communication with a smoke box *P*, through which the products of combustion pass to the vertical tubes *Q Q* which surround the baking ovens shown in Fig. 4. *C* is a division plate and damper, and *T* is a chimney. *I* is a hot closet heated by the products of combustion as they pass from the flues *L L* to the tubes *Q Q*. *I* is a gauge to indicate the height of the water in the boiler. *W* is a hand pump shown in Fig. 2 by which salt water is forced into the boiler; or instead of a hand pump a donkey engine may be employed. Steam is led through a pipe from the boiler *K* to a refrigerator or condenser placed at or near the lower part of the apparatus. A cock is fitted to the upper part of the steam pipe, which regulates the pressure or quantity of steam allowed to circulate round the cooking boilers. The condensed steam after entering the refrigerator traverses the pipes *J J*, enters a compartment *I'*, and passes from thence to other pipes *I'' I''*, after traversing which it enters a filter *Z* which is provided with partitions *Z' Z'*, so arranged that the water may pass through an extended surface of the filtering medium. A pipe is provided by which pure fresh water is drawn off. The space round the refrigerating tubes is filled with cold salt water, and the partition that divides the water in the boiler from that round the refrigerator is composed of felt encased in iron, which prevents any heat passing from one compartment to the other. A pipe is provided for the admission of atmospheric air to the condenser. A small pipe leading from the boiler *K* enters the air pipe, down which it extends a short distance in order to create a draught for the air down the pipe *W*. *a* is a feed cock to the boiler and a waste water cock from the condenser, *b* is a discharge air pipe, *c* is a tap by which hot distilled water is drawn off, *d d* are mud holes, *f* is a brine cock by which the brine can be constantly withdrawn, and incrustation of the boiler thereby to a great extent prevented.

We have taken pains to inquire into the working of these apparatuses as designed by Mr. Graveley and manufactured by Messrs. Winchester and Co., and we find they have given great satisfaction to owners. They are cheaply made, easy to work, and will run for several voyages without requiring any repairs worth mentioning. While, therefore, costly and uncertain apparatuses are constantly being forced upon the notice of ship-owners, we cannot fail to bring the merits of these more economical and efficient ones to their attention.

THE TASMANIAN SUBMARINE CABLE.

The first submarine electric cable of any considerable length in this part of the world has now been successfully laid and opened for public use. The 120 miles of Bass's Straits is thus annihilated, so far as the communication of intelligence is concerned, and the island of Tasmania is for many important purposes as closely united to the mainland of Australia as though no sea rolled between them. This, it will be admitted, is a work of some magnitude for these colonies, and is creditable to the enterprise of Victoria and Tasmania, who have themselves found the whole of the funds for the undertaking. In this case the object to be gained is worth even some annual expenditure in excess of returns, if the line cannot be maintained without it; for their can be no question that to Tasmania the advantage of instant communication with these colonies must be very great. The

annual trade transactions between that island and the mainland are stated by the Launceston papers to be now represented by a sum amounting to more than £1,000,000 sterling, and, as the markets of the one colony are entirely regulated by those of the others, it cannot be otherwise than a matter of deep importance that a close intercommunication should exist between them. One chief source of risk and expense said to be connected with this line is, that it has been laid in four separate sections—first from the north side of the King's Island to Cape Otway on the Australian coast, then in the opposite direction from King's Island to Hummock's Island, thence to Circular Head on the north coast of Tasmania, and from that point along the coast to the entrance of the Tamar, where it joins the land line to Launceston and Hobart Town. From this arrangement the shore-ends of the cable are numerous, and all of them are said to be considerably exposed to injury from the nature of the places at which the landings have been made. Under those circumstances it is being urged upon the Governments of Victoria and Tasmania that they should at once incur the additional expense of procuring from England sufficient surplus cable to make good any injury which either of the four sections may sustain; and this, we think, is a very reasonable suggestion, seeing how many chances of accident the line is exposed to.—*Australian Mail*.

HADLOW'S LINEN MARKER.

THE marking of linen is an operation which is often performed badly, and often neglected altogether for want of a convenient mode of executing it neatly and easily. Observing this, Mr. F. V. Hadlow, of Prince Albert-street, Brighton, has contrived and obtained a patent for a simple little arrangement of apparatus by aid of which we may henceforth get rid of all difficulty in the matter.

It is a neat combination of a relief engraved box-wood stamp, bearing the name, &c., to be placed upon the linen with a supply of Bond's marking ink, the whole being contained in a small case. This case (of birch-wood) is turned in three pieces, screwing together for opening and closing. The central portion contains a very small bottle of fluid marking ink and the engraved marker, just large enough to hold firmly between the thumb and fingers. The top division, in the form of a deep hollow cap, with an ornamental moulding, screws down upon this, whilst the base screws on to the bottom of the central piece, and serves as the receptacle for an india-rubber disc, with a black cloth disc over it. On the base or lower face of the central piece there is attached a code of directions for use, so as to be ever at hand, and most conveniently accessible. All that is necessary is to spread a drop of ink upon the cloth disc resting upon its india-rubber base, press the face of the marker upon it, and then apply it to the linen to be marked. When warned subsequently by an iron the impression comes out clear, black, and indelible. The same apparatus answers for paper and other surfaces. If little ink is used, the markings are very sharp—quite different to the blurred hieroglyphics usually met with. The arrangement is so convenient and effective, that all who have frequent necessity for marking names, numbers, or addresses, must find it extremely useful.

The Duncan, 101 guns, has been launched at Portsmouth. A 51-gun frigate, to be named the Dryad, is to be immediately laid down under the shed vacated by the Duncan.

Paris papers state that the French Government has ordered the systematic gathering of seaweed from the rocks of Normandy and Brittany, to serve as wadding for artillery, for which purpose it serves admirably.

Among new inventions attracting notice is one called the Patent Adamas, a silicious composition, alleged to be free from liability to corrosion or oxidation or destruction from heat or acids, and which is said to be in a course of trial by some of the gas companies as a material for burners, which will save them the expense of constant renewals.

THE CORT TESTIMONIAL FUND.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

Manchester, 14th December, 1859.

GENTLEMEN,—I have read with surprise an article in your Magazine complaining in bitter terms of the conduct of the Cort Testimonial Fund Committee. The aspect of the case as presented by you is calculated seriously to prejudice the interests of the Cort family, inasmuch as it reflects discredit upon a number of gentlemen who met only five weeks since, and, actuated by the utmost sympathy for the family, resolved upon a course which, to the best of their judgment and knowledge of the case, was most likely to secure the end they wished to attain. They proved their liberality by subscribing £260, of which £30 was given to Mr. Cort; and to a man in needy circumstances this could not be, nor ought to have been, a sum received with ingratitude. The committee passed the resolution quoted by you, which it is my duty to see carried out, and beyond that resolution it is impossible to go without another meeting being held to rescind it. So far, about £530 have been subscribed, and it was hoped that £2000 would soon have been obtained; which sum invested in annuities, (after placing the family in circumstances free from debt,) would have been a comfortable yearly income to the recipients. No public movement, as you are aware, can be carried through without affording reasonable time for working it, and that is all the committee require in this case. A few weeks more, and the committee hope to conclude their honorary labours, if their appeal be but promptly responded to. Allow me to beg you will not again by injudicious statements damp the generous ardour of those who have taken up this case, much less attempt to question the justice or benevolence of such men as those who at once and so nobly responded to the claims of genius, or age and infirmity. I am, &c.

DAVID MORRIS.

[We must take the liberty of telling Mr. Morris that we esteem the above both a very foolish and a very impertinent letter—especially the last part of it. What have we said to "damp the generous ardour of those who have taken up this case," or to "question the justice or benevolence of such men." &c.? Did we not expressly say, that the whole thing to which we objected was "doubtless an oversight," and that we gave Mr. Fairbairn "ample credit for meaning and purposing well?" We would inform Mr. Morris—who is but a novice in reference to the Cort case—that by several years of well-considered advocacy of this case we have earned the right to offer a suggestion, and even to administer a rebuke, when other friends of the cause are committing great and palpable errors. We would further tell him, and our readers also (although the latter will have foreseen it) that some of the old and tried friends of the Cort family, and some members of the committee even, are as much astonished as ourselves at the strange resolutions passed at the late Manchester meeting of the committee, and are wondering why the family are not instantly relieved from their liabilities. We have nothing to add to, and nothing to take from, our last week's remarks on the management of the committee. We will only, therefore, add that the past history of the Cort case has demonstrated the strong necessity there is for looking after the money contributed for the benefit of the family; and no anger of Mr. Morris's will prevent us from seeing either that the present fund is properly administered, or that those (if any) who may attempt to misapply it shall have their proceedings brought to light. If Mr. Morris writes to us again on this question, he must amend his tone, or we shall feel bound to enter with greater minuteness than before into the proceedings that have taken and are taking place in connection with the Manchester Fund. All we ask is, that the money subscribed shall be applied to its legitimate object without delay, and we do not believe the committee desire to keep it locked up from the poor and extremely aged people.—*Eds. M.M.*]

STEAM-SHIP ECONOMY.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

GENTLEMEN,—It is very probable, as Mr. Atherton says, "that it is rather a trial of one's patience to repeat explanations in matters of theoretical investigation," but the greater trial of patience to which, notwithstanding, I would again respectfully invite him, is to give an answer to the objections urged against these same explanations, or else to admit their validity. In the

formula $\frac{V^3 D^3}{\text{Ind. h. p.}}$ the objection to the $\frac{3}{2}$ power of

displacement is, that in the case of vessels which are not of the same form or type of build, it is not identical in value with the midship section, and is therefore erroneously employed instead of it; and that in the case of vessels which are of the same type, and where of course it is admitted that there is a virtual identity in these two expressions, the formula embodying either affords no information concerning the comparative merits of steam-ships as marine constructions, either in point of velocity alone, or in conjunction with carrying capacity. How can it, when they are all alike, except in size? The co-efficient set up for a standard would be common to all, apart from the influence of size. The formula might give some information concerning the comparative efficiency of propellers, but Mr. Atherton repudiates any utility in this direction, by assuming that practically it may be considered to have a constant ratio to the power. The formula affords no information concerning the comparative resultant efficiency of the several means employed in the production of power, for it accepts it as already provided, and as declared by the indicator. What then remains to be determined? and which the co-efficient of performance can in a comparative view be supposed to indicate? Nothing as I can see, except the influence of size, in which item there is no variety, nor any scope for the exercise of skill which can, like form, be tested in this way. Such influence can result only from a diminished ratio of water friction accompanying an increase of displacement under the same type. Now, it would be very desirable to ascertain the rate of augmentation of useful effect, by this diminution of the useless effect; but being once determined for the type, what permanent utility would the formula be to merchants? And yet this is its ostensible purpose.

When, indeed, the weight of coals burnt per hour is substituted for the indicated horse-power as the denominator in this formula, we do obtain some information on steam-ship economy, in the coal-consuming, though not in the building department; but the duty done per ton of coals could be ascertained more directly, and in a much better manner, if the performance was registered as declared by the indicator, or by a dynamometer; because the influence of all extraneous circumstances would be eliminated, and because neither time nor velocity, which indeed do not belong to it, would be implicated in the estimate of duty. And this leads me to say, that for vessels of the same type, and not differing greatly in size, any difference in the co-efficients of performance observed in practice by application of the

formula $\frac{V^3 D^3}{\text{wt. of coal.}}$ must be explained as the

result of differences in furnaces, fuel, and firing. This modification of the formula may have a certain utility if confined to vessels of the same type, provided we are given to understand what is truly indicated by it, and that we are not informed that "the fact of inferiority being established, the type of form of the hull, with the condition, construction, or management of the boilers and machinery," are equally points where "the fault may be," and that "under this scrutiny all bad types of form will be eradicated." Whence could arise the illusion that the type is the subject of ordeal, when it is so sedulously impressed upon us that the type is a given element in the question? It is the vessels ranking under each type which are tested, and they only in reference to one fault,

that I am aware of, which is, the foulness of their bottoms. All else refers to boilers, engines, and propellers. Velocity is the natural, as it is the only test of a ship's form, and of the cleanly or dirty state of her skin; but it is very unnecessarily, and in a very round-about way, a test of anything besides.

We now come to the case of vessels of different types: here the comparative worth of the form is fairly the point at issue, that is, the types themselves are on trial, and therefore we must have a test or formula which is applicable to them all. This is in fact saying, that it must apply to vessels in common, without any classification into types at all, at least as a point of necessity. But here the $\frac{3}{2}$ power of displacement is a misleading quantity, because it is no longer identical in value with the midship section. Now, according to Mr. Atherton's own admission, this section is the true basis of any formula; and so it is if velocity be the sole useful effect to be inquired into; but for some reason which I cannot conceive, he chooses to express it in terms of displacement. If, however, we do so in this case, where such expression is erroneous, both as a substitute for the other and for its own demerits besides, the comparative results of steam-ship performances so ascertained cannot be otherwise than false. So then, in fine, for vessels all of one type the formula is useless, and for those of different types worse than worthless.

The midship section formula is appropriate for velocity, but to represent the comparative worth of vessels in the aspect of velocity and carrying capacity conjointly, we must, I repeat, make the simple displacement the basis of the formula. With the use of either it will not be necessary to class vessels according to their type. No such classification is imperatively required with the Cornish steam-engines, in order to estimate and register the duty done by them; nor would it even be useful, except as between pumping engines and crank engines, where the difference is too great for a fair comparison. All other minor diversities of construction go themselves as influencing circumstances into the estimate of performance, along with boilers and modes of stoking. In steamships it would also be useful to divide them into transport and passenger vessels, but without needing any very exact line of demarcation. Either formula would apply to each class, but that based on the simple displacement would be more peculiarly appropriate to the former, and the one based on the midship section to the latter.

Mr. Atherton applies the word "duty" to a dynamic performance in which velocity is an element. It is really undesirable that mathematicians should take up with words of practical origin, and expressive of practical but yet scientific, though not at the time mathematical ideas, and make them include what was not at first intended. "Work" and now "duty" are invested with time and velocity, although originally expressive of power measured by space alone. Mechanical power and mechanical effect were the terms employed, when the idea of time was involved.

Yours, &c.

BENJAMIN CHEVERTON.

LAW CASES.

FIELDEN'S PATENT COPS.

COURT OF QUEEN'S BENCH, DEC. 13.—(Sittings at *Nisi Prius*, before Lord Chief Justice Cockburn and a Special Jury.)

FIELDEN v. LORD AND OTHERS.

Mr. Wilde and Mr. Hindmarch appeared for the plaintiff, and Sir F. Kelly, Mr. M. Smith, and Mr. Aston for the defendants. The plaintiff, a workman employed in a cotton-mill, brought this action against a mill-owner for an infringement of his patent for improvements in the construction and building of cops, and the defendants alleged that one Enoch Fielden was the true and first inventor, and that the plaintiff obtained his patent by fraudulent representations. A cop is the cotton wound off on the spindle in a conical shape at the ends, having a hole throughout, as in an ordinary cot-

ton-reel, caused by the spindle, and used in placing the cop on the shuttle. In practice it was found that a great deal of cotton was wasted by the bottoms of the cops being "britted" while being taken from the mules in baskets to the machinery for the next process of manufacture. To obviate the difficulty, gutta-percha foundations for the cops were used; but a more complete remedy was discovered in running a brush of paste along the mules, so as to coat the bottoms of the cops and render them less liable to injury. John Fielden, the plaintiff, and Enoch Fielden were friends, and, in a conversation one Sunday afternoon, the latter suggested that paste would do. John Fielden experimented and took out a patent first. Enoch Fielden stated that before the conversation he had experimented and tested by success the value of his invention. He also took out a patent, and Messrs. Lord defended this action, relying upon Enoch Fielden being the first inventor.

The case commenced yesterday, and occupied the greater part of to-day, terminating in a verdict for the defendants.

OXLEY'S PATENT HINGES, ETC.

COURT OF COMMON PLEAS (second court), DEC. 13.

OXLEY v. HOLDEN.

This was an action to recover £50, being the amount claimed for royalty upon the sale of certain hinges, elastic cushions, and studs and plates intended to be used in the windows and doors of railway carriages; the object of which was to prevent the noise and jarring usual when trains are in motion. The plaintiff, who claimed to be the inventor of the above articles, had entered into an agreement with the defendant, whereby the latter was permitted to manufacture and sell them, paying upon each a royalty of 4d., it being further stipulated that the plaintiff should be paid at all events £100 per annum by four equal quarterly payments. There were pleas negating the novelty of the alleged inventions, and that the defendant was induced to enter into the agreement by the fraud and misrepresentation of the plaintiff. The jury found a verdict on both issues for the plaintiff.

Mr. Wordsworth, Q.C., and Mr. Henry James appeared for the plaintiff, and Mr. Serjeant Shee, Mr. Hindmarch, Mr. Keane, and Mr. Griffiths for the defendant.

Our Weekly Gossip.

THE Admiralty have decided upon building two new iron frigates in addition to those now in course of construction by the Thames Iron Shipbuilding Company and Messrs. Napier of Glasgow. The new frigates are to be of a similar construction to those already in progress, but of smaller dimensions. Contracts for them have just been taken, one by Messrs. Palmer, of Jarrow, and the other by Messrs. Westwood and Baillie, of Millwall. It may be well to state that the two new frigates are designed exclusively for home defence.

The Queen has granted a pension of £150 a-year out of the civil list pensions to the daughters of Henry Cort, whose inventions in the manufacture of iron have contributed so much to the prosperity of the trade, while his family have been left in deep distress. The Queen has also been pleased to grant a pension on the civil list of £125 a-year to the sisters of the late Dr. Dionysius Lardner, whose contributions to science are so well known.

It is a singular fact, and one which illustrates the dependence of trades of almost every kind upon the eccentricities of the devotees of fashion, that since the extensive use of crinoline in England, the wire-drawers, and a considerable section of the wire-workers of the kingdom, have been exceedingly busy, and are at this moment obtaining very high wages! It is not easy at once to comprehend the cause of this phenomenon, or to trace the connection between crinoline and brass wire, but a little reflection makes the matter clear. The wearers of crinoline, from the amplitude of their costume and the consequent difficulty of calculating distances, are more exposed in their homes to danger from fire than are those other ladies whose dresses project little beyond the limits assigned by nature to their fair forms.

necessity for extra-precaution in the shape of wire fire-guards—hence the pressure on the wire-trade—hence the high rate of wages referred to. It is satisfactory to observe, too, that an impulse has been given to *art* as well as to labour in the matter of fire-guards. All will remember the primitive nature of those articles as hitherto used in nurseries, &c., but now that they are required for the protection of "grown-up children," and have to figure "before company," it has been found desirable to vary their forms, materials, and prices, and to impart "style" and taste into their construction. They are at present used in West-end drawing-rooms, as well as in humbler parlours, and must be made consonant, therefore, with the neighbouring furniture, the fittings of the refracting and ornamental stoves, and the richly ornamented fenders. If this were not so they would be pronounced "de-ci-dedly vul-gar," and, despite their preservative value during the mazy dance, a "horrid baw." We have seen some elegant specimens of modern fire-guards, and we know that several firms in London are overburdened with orders for them "to be supplied immediately and regardless of cost." Well may the workers referred to rejoice in the prevalent fashion, and loudly exclaim, "*Vive la crinoline!*"

The following letter suggests an important consideration or two:—

London, 12th Dec., 1859.

GENTLEMEN,—After reading your notice of the termination of the Board of Trade's inquiry upon the loss of the Royal Charter in "Weekly Gossip," page 380, of your last number, I cannot refrain from troubling you with two remarks, in confirmation of the barren results to public good of such inquiries so conducted. First, it is stated: "Her cables were full 2½ inches in diameter, and were tested by the makers to 72 tons." Now, Mr. Trotman, in his letter to the *Times*, stated (correctly) the Admiralty test for such a cable is at least 81½ tons. Permit me to say, with some knowledge of the subject, that 72 tons will rarely pull out the worst of work from a cable of that size, particularly if made of inferior rigid iron; 85 tons would be nearer the strain required to dislodge a half-welded link. Again: why not ask if the Royal Charter was brought up within the breakers that parted her cables? Judging from the evidence upon Captain Taylor's seamanship, he brought the ship up in fair water; if so, did she drift from her first position to where she parted? If she did not drag her anchors, why ease them with the screw? and if she did drag until her anchors held in the *rocky bottom*, which caused the breakers which parted her cables, why not extract this, if possible, by evidence, so that no *shadow* may be thrown over anchors of one model or another.

I am, Gentlemen, a much obliged

SUBSCRIBER.

A correspondent writes: "The sad destruction of this fine ship (the Royal Charter), and the fearful loss of property—and, above all, of life—attending that and the numerous other shipwrecks that yearly occur, may well lead every one to exert himself to devise means of preventing them. Your correspondent, Mr. Bendelow, who suggests a method of relieving the strain on cables by means of pulleys, does not, perhaps, remember that the catenary curve of the cable, and the imperfect resistance which the ship opposes to the wave force, do all that can be done at that end of the cable. But at the anchor end there is an unyielding resistance, and when the anchor does not itself drag or break, the parting of the cable often takes place near it. I believe that the true remedy consists in increasing the strength of both anchors and chains; and now that steel is so much more cheaply and easily made, it is inconceivable that, with the interests at stake, shipowners should not take advantage of a material whose cohesive strength is nearly double that of even the best iron. Iron ranges in cohesive strength between 25 and 30, and steel between 50 and 59, tons per square inch of section."

The following letter merits a place here:—

GENTLEMEN,—Having some time ago experimented during two rough trips at sea, an account of the results may perhaps deserve a spare corner in your valuable publication. The first trip I lay as my fellow-passengers did, with my head towards the stern and my feet towards the engine-room (the centre of motion), and on my right side. The result was very much like that of a stomach pump. On the next trip I lay on my left side, with my head towards the engine-room and feet towards the stern. The result was, that I was the only one in the cabin unaffected with sickness; my fellow-passengers lying the contrary way. The *rationality* of these results is clear. The œsophagus or entrance to the stomach is on the left side, the pylorus or eduction on the right. When

lying on the left side as described, the centrifugal force from the *rolling* was from the œsophagus to the pylorus, promoting digestion. The centrifugal force from the *pitching* of the vessel was from the head towards the stomach, tending to keep down my good breakfast, and promote digestion also. These effects were of course reversed on my first trip. The rule to be observed is therefore simple: "Lay on your left side with your head towards the middle of the vessel."

I am, Gentlemen, your very obedient servant,

T. MOY.

We understand that a new process of galvanizing wire has recently been discovered by a gentleman connected with the Administration of Telegraphs at Paris, and the application of the invention has been successfully made to the galvanization of telegraph wires. The inventor (Mr. Cuche) states that the chief advantage of his improved method over the old one consists "in its allowing a very thick coating of zinc (which adheres in a most perfect manner) to deposit itself on the wire, which not being afterwards subjected to any friction whatever, prevents any hindrance to the crystallization." The zinc deposited on the wire in this way being much thicker than by the usual process, it consequently resists much longer the action of chemical agents, &c. The discovery has been patented for France and foreign countries, and is said to be already patronized by the principal house which supplies the French Administration with telegraph wires.

NOTICES.

The MECHANICS' MAGAZINE will be sent free by post to all subscribers of £1 ls. 8d., annually, payable in advance. Post Office Orders to be made payable to R. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 3d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

Patents for Inventions.

ABRIDGED SPECIFICATIONS OF PATENTS

The abridged Specifications of Patents given below are classified, according to the subjects to which the respective inventions refer, in the following table. By the system of classification adopted, the numerical and chronological order of the specifications is preserved, and combined with all the advantages of a division into classes. It should be understood that these abridgements are prepared exclusively for this Magazine from official copies supplied by the Government, and are therefore the property of the proprietors of this Magazine. Other papers are hereby warned not to produce them without acknowledgment:—

STEAM ENGINES, &c., 1122, 1186.
BOILERS AND THEIR FURNACES, &c., 1119.
ROADS AND VEHICLES, including railway plant and carriages, saddlery and harness, &c. None.
SHIPS AND BOATS, including their fittings, 1123.
CULTIVATION OF THE SOIL, including agricultural and horticultural implements and machines, 1129.
FOOD AND BEVERAGES, including apparatus for preparing food for men and animals, 1445.
FIBROUS FABRICS, including machinery for treating fibres, pulp, paper, &c., 1090, 1092, 1121, 1121, 1133.
BUILDINGS AND BUILDING MATERIALS, including sewers, drain-pipes, brick and tile machines, &c., 1091, 1093, 1097, 1126.
LIGHTING, HEATING, AND VENTILATING, 1093, 1130, 1140.
FURNITURE AND APPAREL, including household utensils, time-keepers, jewellery, musical instruments, &c., 1111, 1113, 1136.
METALS, including apparatus for their manufacture, 1103, 1115, 1117, 1120, 1128.
CHEMISTRY AND PHOTOGRAPHY, 1090, 1101, 1107, 1139.
ELECTRICAL APPARATUS, None.
WARFARE, 1132.
LETTER PRESS PRINTING, &c., 1100, 1110.
MISCELLANEOUS, 1099, 1051, 1093, 1094, 1096, 1102, 1103, 1104, 1105, 1106, 1108, 1109, 1112, 1114, 1116, 1118, 1123, 1127, 1131, 1134, 1135, 1137, 1138.

1099. J. BULL. "Improvements in apparatus used for securing bales of cotton and other substances." Dated April 30, 1859.

This consists in causing the ends of a suitable length of strip metal or of hoop iron to be bent into hooks, and to employ therewith a plate of metal with a rectangular or suitable opening through it, so that when a bale of cotton has by pressure been brought to the

desired size, and the strip of metal passed round it, the link or plate is placed on one of the hooks, and then the other hook is passed through the plate, by which, when the bale is released from pressure, the two hooks will be inwards towards the bale, and will be retained secure by the plate. *Patent abandoned.*

1000. C. H. G. WILLIAMS. "Improvements in the manufacture of colouring matters, and in applying the same for dyeing and printing fabrics and materials." Dated April 30, 1859.

By the destructive distillation of quinine, chinchona, strychnine, or brucine, a series of liquid basic substances is obtained, and it is from such substances that, according to the present invention, colouring matters suitable for dyeing and printing fabrics are manufactured. In employing these colouring matters for printing fabrics, the patentee prepares a solution of the colouring matter as before, and he thickens it with albumen and applies the compound to the fabric by blocks or otherwise. Colouring matters may also be obtained by acting on salts or compounds of aniline, toluidine, xylydine, cumidine, or cymidine with permanganate of potash, and afterwards treating the precipitate. *Patent completed.*

1001. J. SOUQUET. "A new or improved process for distilling coal." Dated April 30, 1859.

The patentee claims, 1, the calcination, or destructive distillation of a mixture of pulverized coke and coal in the manufacture of gas for obtaining a larger quantity of gas, and also to render the coke resulting therefrom of more value. 2, The calcination or destructive distillation in coke ovens of a mixture of pulverized coke and coal for producing coke of greater density, which will also produce coke of good quality from any kind of coal. *Patent completed.*

1002. T. H. ARROWSMITH. "Improvements in carding engines." Dated May 2, 1859.

This consists in employing one adjusting screw at each end of the flat, for setting which screw the patentee supports and adjusts a bracket or plate formed to suit the working (technically called the "set of the card"), lateral movement of the bracket or plate being prevented by forming it with a flat surface, and fitting it against the bend of the carding engine, or by a steady pin or other contrivance. *Patent completed.*

1003. A. JUMELAIS. "An apparatus yielding unlimited power, so called 'French movement'." Dated May 2, 1859.

This apparatus consists of a series of tubes tightly connected with each other, each tube containing a helix of ordinary form which actuates a shaft projecting from the said tube, and operating an external pulley. The issuing out of the said shaft from the tube is to take place without any intrusion of the air into the interior of the tube, that is to say, without any leakage, which can easily be obtained by a stuffing box-lid. The permanent pressure is obtained by a double-piston sucking pump, which actuates one end of the connected tubes. *Patent abandoned.*

1004. J. FERGUSON and J. MCGAVENY. "Improvements in fasteners for shutters and for similar uses." Dated May 2, 1859.

The ordinary fastening bolt is here modified so as to become locked by a catch when pushed home into a socket. *Patent abandoned.*

1005. W. BAYLIS. "Improvements in the manufacture of iron hurdles and fencing." Dated May 2, 1859.

The patentee claims so forming the iron for fence rails, either rolling, swaging, or subsequently by hammering or pressing, that it shall partially clip the intermediate hurdle or fence standard, so as to prevent their having any lateral motion. Also the manner of shouldering and forming projections at the ends of hurdles or fence rails where they are united to the end standards; likewise the mode of uniting hurdles and fencing together. *Patent completed.*

1006. R. A. BROOMAN. "Improvements in, and in connection with, electro-magnetic engines." (A communication.) Dated May 2, 1859.

The object here is so to construct electro-magnetic engines, and apparatus connected therewith, that the attractive and repulsive forces of electro-magnets may be utilised and caused to act simultaneously upon the same part or parts of the engine—that the reciprocal action of fixed and moveable magnets may be made available in producing motion—that the electro-magnets employed may be rendered active both by external and internal electrical actions—that the action of the electric current or currents may be practically continuous—and that the maximum magnetic forces may be made available for the production of power. *Patent completed.*

1007. J. BASFORD. "An improvement in the apparatus used when expressing clay or brick earth through dies." Dated May 2, 1859.

This consists in forming the bridge which carries

the core or interior die in a bent or zig-zag form, and so that the clay or plastic brick earth in place of being cut radially is divided in an inclined direction, by which a lap joint is formed in the clay. *Patent completed.*

1098. J. CHILDS. "Improvements in the manufacture of night-light cases." Dated May 2, 1859.

This consists in wrapping or forming the cylinders of paper or wood on to the bottoms of plaster, cement, or other material, thus forming the upper parts on the bottoms. *Patent completed.*

1099. W. GOSSAGE. "Improvements in the manufacture and useful application of certain alkaline silicates, and in the production of liquor silicis, or liquid fluid." Dated May 3, 1859.

This consists, 1, in using in the manufacture of soluble glass carbonate of potash or carbonate of soda, which has been previously deprived of sulphate of potash or sulphate of soda, the liquid flint thus produced being free from alkaline sulphuret. 2. In the application of such solutions to rendering stones, bricks, wood, paper, woven fabrics, and other materials impermeable to water. 3. In the manufacture of silicate of lime by decomposing solutions of silicate of potash or silicate of soda by caustic lime or carbonate of lime, or by boiling such native silica as is readily dissolved by caustic alkali with a mixture of caustic lime and caustic potash or soda dissolved in water, by which means a silicate of lime is obtained in such state as renders it usefully applicable for promoting the growth of plants. *Patent abandoned.*

1100. D. MOORE. "Improvements in machinery for rubbing or dressing types." Dated May 2, 1859.

This relates to the manner of feeding the types one by one or in a regular manner to the automatic device which takes the said types and carries them letter-end first through or between cutters that rub or cut and remove the projections which remain on the sides of the types and base of the letters after casting. The invention also relates to a device for removing the types from the parts that have carried the said types through the cutters, and receiving the types on an apparatus that reverses their movement or position, and delivers them with their base or lower end first on to an apparatus for setting the types up into line ready for the usual finishing operations. *Patent completed.*

1101. W. GOSSAGE. "Improvements in the manufacture of caustic soda and carbonate of soda, from certain alkaline liquids." Dated May 2, 1859.

The patentee claims, 1, the manufacture of carbonate of soda from caustic soda contained in salts obtained by the concentration of black ash liquors, by exposing such salts mixed with caustic soda to carbonic acid gas. 2. The manufacture of caustic soda (obtained as before stated) by boiling such salts with water and caustic lime. 3. The manufacture of caustic soda by boiling a solution of soluble glass with caustic lime, so as to produce silicate of lime and caustic soda. *Patent completed.*

1102. C. NUTTALL. "Improvements in machinery or apparatus for grinding wire cards." Dated May 2, 1859.

This consists in a method of traversing the strikers or other apparatus used for grinding wire cards. The inventor employs a shaft upon which are cut two threads of screws in opposite directions so as to cross each other, whereby the strickle is caused to travel first in one direction and then in the other. *Patent abandoned.*

1103. F. W. EMERSON. "Improvements in treating ores to obtain a new metallic substance and its salts, and in the application of such matters, and also certain products of tungsten in dyeing, printing, and painting." Dated May 2, 1859.

This consists, 1, in the separation of a metallic substance, which the inventor designates "chrolithineum," from wolfram tungstate of lime, tungstic oxide, and other ores of tungsten, and in the manufacture and application of its various salts to dyeing textile fabrics, painting on porcelain, and the production of paints and pigments. 2. In the manufacture and application of the blue oxide of tungsten as a dyeing substance for textile fabrics, and as a paint or pigment. 3. In the production of paratungstate of alkali, metatungstate of alkali, isotungstate of alkali, and polytungstate of alkali, which may be used in the preparation of paints and pigments, and for dyeing textile fabrics, and for other purposes, and in the combination of paratungstic, metatungstic, isotungstic, and polytungstic acids with any suitable metallic oxide or mixtures of metallic oxides as a base, such as the oxides of lead, zinc, barytes, lime and others, to form paints and pigments. *Patent completed.*

1104. A. G. FRANKLIN. "Improvements in the manufacture of crayons." (A communication.) Dated May 3, 1859.

The required primary colour is mixed with clay,

(holus) well ground together in water, and dried. When the colour is dry, a solution of tragacanth gum is added to it, and the whole kneaded to a paste, of which the pencils are formed by means of a cylinder or press. The pencils are then again well dried or hardened, and dipped in a hot solution of stearine spermaceti and cocoa-nut oil; after about an hour the pencils are taken out, and washed in oil of turpentine. *Patent abandoned.*

1105. W. JOHNSON. "Improvements in the manufacture or production of mineral oil and grease." (A communication.) Dated May 3, 1859.

This relates to the production of oil, oleaginous matters, and grease from mineral shales of various kinds, and from all or any bituminous materials not being commercially and generally known as coal. The raw shale, &c., is primarily distilled in an ordinary retort, and the product is afterwards re-distilled as often as may be necessary. *Patent abandoned.*

1106. T. W. MILLER. "Improvements in apparatus for, and mode of, generating steam and economising fuel." Dated May 3, 1859.

The patentee claims, 1, the construction and arrangement as described of tubes, flues, or sheet spaces for the passage of the heat and products of combustion in a marine or other boiler having several furnaces, laterally and transversely to the lengths of the furnaces, and above or over the bars of each furnace, so that the products of combustion from the first furnace shall pass over the several furnaces between it and the uptake or chimney or outlet, and in like manner the products of combustion from the intermediate furnaces between the first furnace and the uptake or chimney or outlet shall pass over the several furnaces and the fuel therein contained. 2. The arrangement of tubes, flues, or sheet spaces for the passage of the heat or products of combustion in a marine or other boiler having more than one furnace, whether the same be arranged laterally and transversely to the length of the furnaces, or longitudinally, or lengthwise with the length of the furnaces, but above or over the bars of the furnaces, so that instead of passing the products of combustion the first over the second, and second over the third, and so on, they may be alternated and the total length of the furnace be divided into two or more parts, so that the products of combustion from one furnace to another may be led or divided laterally from the front, from the back, and from the centre part of such furnace to the next or to the next but one, or to any other furnace in the series further therefrom. 3. The use and employment of a series of tubes, pipes, or sheet spaces with a suitable entrance pipe and conducting chamber, for the passage through them of the moist steam generated in a boiler, by which the steam in its progress to the main steam pipe of a steam engine becomes dried, or the water held in suspension becomes vapourised, whether tubes, pipes, or sheet spaces be arranged longitudinally or transversely, or in other direction in the upper or in any other part above the level of the water line of a marine or other description of boiler, or in a steam chest open to or separate from a boiler, by which the series of pipes, tubes, or sheet spaces may be surrounded by steam from the boiler and be kept or maintained at the highest temperature due to their position. 4. The novel construction and arrangement of the interior structural parts, as well as the mode of applying surface condensers or refrigerators as described, when such condensers or refrigerators are attached to steam engines or boilers for the purpose of obtaining fresh water from the exhausted steam, or steam otherwise discharged from boilers containing salt or sea water, or water impregnated with impurities, rendering its use destructive to boilers, or from boilers fed with pure and fresh water. *Patent completed.*

1107. W. CLARK. "Improvements in obtaining or extracting quinine and the principal organic alkalies." (A communication.) Dated May 3, 1859.

Here a decoction is obtained from the bark by hydrochloric or sulphuric acids; an alkali or alkaline carburet is then added until precipitation ceases. The liquor holding the precipitate in suspension is then boiled, and a certain quantity of solid fatty acids added; these acids then melt and form a layer on the surface with which all parts of the liquid under the influence of ebullition come in contact successively, and the quinine being dissolved in the water combines with the fatty acids and forms with it a perfectly insoluble soap. After a certain time the precipitate becomes of a blackish colour, and the alkaline liquor is transformed into quinine acid. The liquor is then allowed to cool, when the fatty acids become solidified on the surface, and are removed in the form of a cake and then boiled with distilled water for removing any impurities with which it may be mechanically combined. This is continued until the fatty matter yields nothing more to the pure water; it is then boiled in

water acidulated with sulphuric acid, and the excess of acids subsequently saturated by an alkali. Some dark matters will be precipitated, and after filtration a crystallized block of sulphate of quinine will be obtained by cooling, which block may be purified as usual. *Patent completed.*

1108. W. SELLERS. "Improvements in couplings for shafting." (Partly a communication.) Dated May 3, 1859.

This coupling consists of an external sleeve into the opposite ends of which are fitted two other sleeves in the forms of frustrums of cones, the apex of the cones being towards each other. These conical sleeves are bored to fit the shafts intended to be coupled, and are divided by one or two longitudinal cuts to enable them to be closed on the shafts. The sleeves are prevented from turning on the shafts by keys which lock them to the outer sleeve, and they are drawn together by square bolts which pass through part of the external sleeve, and when the nuts on the bolts are screwed up, the bolts will prevent the two internal conical sleeves from turning in the external sleeve. *Patent completed.*

1109. W. SELLERS. "Improved machinery for making screw bolts and nuts." Dated May 3, 1859.

The object here is to prevent the necessity of reversing the motion of the cutting dies, or of stopping the machines to change the bolts, and to so arrange the die and top holder as to admit of greater facility in changing from one size thread to another. *Patent completed.*

1110. J. MORSE. "An improved power-printing press." Dated May 3, 1859.

This invention comprises various features which are not fully described apart from the drawings. *Patent completed.*

1111. L. R. BLAKE. "A new and useful or improved machine for sewing a sole on a boot or shoe." Dated May 3, 1859.

This consists, 1, in arranging the shoe rest on the end of an arm extending from the supporting frame of the machine, and capable of entering the shoe, the said rest entering the interior of the shoe that an outer sole may be stitched upon the inner sole and upper of the shoe or boot. 2. In arranging the thread passage, or looper, or both, within, or so as to operate with, the shoe-supporting arm. 3. In the application of the feeding mechanism to the needle or its carrier, so as to enable the feeding mechanism to be revolved around, or with the said needles and its carrier, in order to change the direction in which the shoe is to be fed along. *Patent completed.*

1112. H. CHAPMAN. "An improved military camp-cooking apparatus." Dated May 3, 1859.

The object here is the obtaining of a large amount of heating surface with a small quantity of fuel. The apparatus is composed of three principal parts, which are intended to contain water at the lower part thereof, except the bottom of the third or middle compartment, which may be used for roasting coffee. At or near the division of each of the aforesaid compartments a dome or other shaped opening is to be formed, from whence proceed tiles or pipes passing respectively through the several compartments in a horizontal direction. The ends of those tubes which come through the outer casing have valves or dampers for opening and closing the ends of the tubes for regulating the intensity of the heat in the apparatus. The before-mentioned compartments are intended to be fitted with shelves, trays, hocks, strainers, and such-like apparatus for performing the operations of boiling or steaming meat, vegetables, and other articles of food. To use this apparatus it is only necessary to place it over two braziers containing fire, the heat from which traversing the several tubes of the apparatus, will be given off, and speedily raise the temperature of the water therein. *Patent abandoned.*

1113. H. CHAPMAN. "Improvements in the construction of kettles." Dated May 3, 1859.

This consists in forming the bottom of the kettle partly flat and partly of a dome shape; from the top of such said dome a tube or pipe extends in a horizontal direction through the body of the kettle and back part thereof, the outer end of the said tube being furnished with a damper or valve for regulating the intensity of the heat. The inside of the kettle at the bottom of the spout thereof may also be fitted with a valve. By thus constructing kettles the fire is not deadened or prevented from burning, but by opening the outer valve aforesaid a draught will be established through the kettle, and thereby cause the fire to burn brightly so that if a fire should be nearly out, it will draw it up, at the same time the heat from the fire, being directed to and through the kettle, will speedily boil the water contained in the kettle. *Patent abandoned.*

1114. E. W. SCALE. "Improvements in railway signals." Dated May 3, 1859.

Here the flanges of the wheels of the engine come

in contact with and thereby depress the end of a vibrating lever, at the same time raising the opposite end of the lever and pushing a fan signal out of its box; the fan expanding to a semicircular shape simultaneously with this raising of the signal a pneumatic collapsible bag or bellows will be distended and admit air thereinto, and after the flanges of the several wheels in the train of carriages have ceased to act upon the end of the lever, the weight of the rod to which the fan is affixed will cause the pneumatic bag or bellows to collapse and force out gradually the air contained therein, the stop-cocks or valves being so arranged as to cause the signal to be a certain time in descending, thus indicating to a following train the fact of a forward train having recently passed. *Patent completed.*

1115. R. MUSHET. "An improvement in the manufacture of cast steel." Dated May 3, 1859.

This consists in producing a superior quality of cast steel by melting malleable iron together with carbonaceous matter and ores, or oxides of titanium, or titaniferous iron ores, or titanous acid, or deoxidized titaniferous iron ores. *Patent completed.*

1116. W. H. KINGSTON. "Improved means of communication between the passengers and guards, and guards and engine drivers of railway trains." Dated May 4, 1859.

This invention is not described apart from the drawings. *Patent completed.*

1117. C. F. VASSEBOT. "An improved form of tuyere for blast furnaces." (A communication.) Dated May 4, 1859.

This consists in a box or air reservoir of cast iron having two elbow pipes, and an opening to receive a cap of cast iron in which is formed the aperture which communicates with the furnace. One of the elbow pipes is fixed to the bellows or the fan; the other passes vertically through the arched masonry into the interior of the furnace. *Patent abandoned.*

1118. J. ADOLPHUS. "An improvement in locks, bolts, and latches." Dated May 4, 1859.

This improvement as applied to locks and bolts consists of a pin, peg, or screw (which when it is desired to secure the lock or bolt) is passed through the fixed part of the lock or bolt, and into, through, or behind the sliding bolt in such a manner that the said bolt cannot possibly be shot back until such pin, peg, or screw has been withdrawn by some person on the inner side of the door, gate, or shutter. Also, as applied to latches in the use of a similar pin, peg, or screw, which when it is desired to secure the latch is passed into, through, or above the latch and into the back plate or the fixed of the latch for the purpose described. *Patent abandoned.*

1119. W. E. NEWTON. "Improvements in steam-boilers." (A communication.) Dated May 4, 1859.

This consists in the employment of perforated air-tubes in the fire-chamber, and above the fuel, which tubes receive atmospheric air from outside the fire-chamber, and discharge its numerous small jets among the gaseous products of combustion. The perforated air tubes are each endorsed within, or are surrounded by, a water-tube connected with the water legs or other spaces of the boiler. The air-tubes are also provided with hollow stay bolts, which form passages for the discharge of the numerous jets of atmospheric air among the gaseous products of combustion. *Patent abandoned.*

1120. J. G. WILLIAMS. "Improvements in utilizing bog stuff or peat, when applied for treating metals and certain mineral and alkaline substances." Dated May 4, 1859.

The patentee claims, 1, the mixing bog stuff or peat, in the state above defined as undried, with pig or cast iron in a divided state, also the moulding of the same preparatory to its being exposed to heat in contact with the said bog stuff or peat intermixed therewith. 2. The collecting of tar, and other condensable products given off from bog stuff or peat whilst being used as fuel in lime-kilns. 3. The adding to, and intermixing with, ores of iron previously broken or pulverized bog stuff or peat in the state above defined as undried; also the moulding of the said mixture preparatory to its being exposed to heat. 4. The use of bog stuff or peat in the state above defined as undried for mixing with sulphate of baryta or sulphate of soda, preparatory to such sulphates being reduced to sulphurets by the application of heat, all as described. *Patent abandoned.*

1121. J. C. WILSON. "Improvements in machinery for cleaning cotton." Dated May 4, 1859.

Here two rollers are employed in combination with a blade or bar which constantly vibrates or oscillates so as to keep or push back the seeds until they are freed from the cotton and fall down below the rollers. *Patent abandoned.*

1122. H. TURNER. "Improvements in steam-engines and apparatus connected therewith." Dated May 5, 1859.

Here the objects are the economic employment of high pressure steam which has been generated by any suitable means, by using it in the highest degree expansively in low pressure engines, and also in the economical treatment of the steam after it has performed its work in the cylinder or cylinders of a steam engine by the employment of surface condensation, effected by a novel arrangement of surface condenser and centrifugal water-circulating apparatus; also economizing fuel, and securing the continuous supply exclusively of fresh feed water to the boilers of marine and other engines by making up the waste arising from leakages and other causes. It relates more particularly but not exclusively to marine steam engines, and consists in constructing and fitting steam cylinders of larger diameter than ordinarily employed on board ships, and by certain apparatus admitting and employing and using the steam within the cylinder or cylinders from the steam pipe or expansion box at any suitable pressure for only a very small part or portion of the travel of the piston within such cylinder, after which it is allowed again to expand, and being aided by the vacuum on its opposite side the piston moves or travels to the end of the cylinder and thus performs its full stroke; but instead of employing the ordinary air pump and injection condenser he substitutes an apparatus by the introduction of which he is enabled to effect considerable economy in boiler room and the consumption of fuel necessary for generating or producing a given amount of power in engines constructed and worked as heretofore. The details are voluminous. *Patent completed.*

1123. J. F. ALLENDER and D. BOWLEY. "Improvements in shears for cutting boiler plates and sheets, and for other like purposes." Dated May 5, 1859.

This invention is not described apart from the drawings. *Patent completed.*

1124. J. SCHOLFIELD, and W. CUDWORTH. "Certain improvements in machinery or apparatus for spinning cotton and other fibrous materials." Dated May 5, 1859.

This relates to that class of spinning machines known as "mules," "twiners," &c., and consists in making that part of the mule which regulates the speed of the spindles when winding on self-acting. *Patent completed.*

1125. H. CHAPMAN. "Improved means or appliances for protecting ships against injury from shots, shells, or other warlike projectiles." Dated May 5, 1859.

This consists in adapting a contrivance which the inventor terms a "naval shield" to the sides of the ships, the said shield being capable of being raised or lowered either into or out of the water by a ship's tackle so as to cover any particular part of a ship. *Patent completed.*

1126. H. CHAPMAN. "Improvements in the construction of fortifications." Dated May 5, 1859.

This consists in adapting to fortifications a contrivance for protecting the same against injury from shots, shells, &c., the object being to present a yielding surface to the action of the projectiles for destroying the effect thereof. *Patent abandoned.*

1127. W. F. BATTO and E. M. BAUER. "Improvements in drills for reaming, cutting slots, keyways, and cotter holes." Dated May 5, 1859.

The inventors employ an improved drill or cutting tool having three or more cutting edges, and they form the cutting edges by making spiral grooves on the exterior of the drill in connection with a closed taper recess in the centre. *Patent abandoned.*

1128. E. J. HUGHES. "Improvements in the manufacture of sheet-iron." (A communication.) Dated May 5, 1859.

This consists, 1, in procuring well carburized charcoal pig iron cold black, and in purifying it either in the refining or puddling furnace by a flux or compound of reagents. 2. In working the iron thus produced in the puddling oven, and with hammers, and afterwards reducing the same into sheets. 3. In passing the sheets through etched or mottled rollers. 4. In enclosing the said sheets in an air-tight iron case and heating them up to a bright cherry red, and then subjecting them to the action of a gang of heavy hammers until they are no longer red; charcoal is used in this process to maintain the heat as long as possible. 5. In submitting the said sheets a second time to the same operation, the amount of heat communicated to them previously being somewhat less, and the hammers of more powerful operation. 6. In enclosing them a third time in an air-tight case for being annealed in a properly constructed furnace. *Patent abandoned.*

1129. W. CLARK. "Improvements in seed depositors or drills." (A communication.) Dated May 5, 1859.

The particular feature in this invention consists in

the tractive force not being made use of in distributing the seed. For this purpose a special apparatus having a separate motion is adapted to the implements consisting of a spring and train which imparts a rotary movement to a distributor depositing a certain quantity of seed in the ground supplied from a hopper. *Patent completed.*

1130. A. KNOX. "Improvements in gas regulators." Dated May 5, 1859.

This relates to such gas regulators as have a weighted flexible diaphragm upon which the gas admitted to a small chamber acts, and by such action increases or lessens the passage of gas to the burners. The improvements consist, 1, in the arrangement of two or more valves in combination with each other for the admission of the gas to the diaphragm chamber, so that their weight and the pressure of the gas on them counterbalances each other, by reason of which the regulator will work with great uniformity even at the lowest pressures. To effect this the inventor connects the valves by a light lever mounted on a suitable fulcrum, faces the valves with leather and constructs the central spindle supported by the diaphragm of the low pressure chamber hollow. *Patent abandoned.*

1131. H. REYNOLDS. "Improvements in refining sugar and other saccharine substances." Dated May 5, 1859.

The patentee claims, 1, the dissolution of sugar and other saccharine substances by means of an ascending and descending current of fluid propelled by mechanical means. 2. The employment of the salts of tungsten, either as the oxide or in combination with a base, for example, lime or soda, in the refining of sugar and other saccharine substances. *Patent completed.*

1132. R. A. BROOMAN. "Improvements in cannons and other fire-arms, and in projectiles, wads, and cartridges to be used therewith." (A communication.) Dated May 5, 1859.

The patentee claims, 1, the covering of projectiles with an elastic material or soft wire cloth. 2. The employment of an elastic wad or ring attached to the rear end of the projectile. 3. The forming of cartridges of wire cloth or perforated metal plate. *Patent completed.*

1133. H. FLETCHER. "A machine for scutching and carding tow, oakum, or waste cordage." (A communication.) Dated May 5, 1859.

The inventor constructs a machine with a framework of cast-iron, and at one end he has a platform furnished with spikes, amongst which the tow, &c., is drawn and passed by a feed-roller covered with card to a series of four-grooved rollers, which are weighted at the bearings so as to grip the material firmly; it is then subjected to the action of a beater or scutcher which has six bars, three plain and three jagged, so as to beat and spread the material, which is then passed to two carding cylinders, and thence to a doffing cylinder, from which it is combed and passed to a large drum, upon which it is tightly lapped by weighted roller. The various speeds of the rollers, beater, and cylinders are obtained by wheels and pulleys, and he makes the beater shaft the prime mover, and provides the same with a fly-wheel to give the machine a uniform motion. *Patent abandoned.*

1134. W. E. NEWTON. "An improved steam gauge." (A communication.) Dated May 5, 1859.

This consists in arranging or connecting an adjustable weighted index or lever (which travels over a curved scale) to a piston placed in a tube which extends from the outside of the boiler down into the water-space thereof. The pressure exerted by the water in the boiler on the piston will force the latter up in the tube, and this pressure will be indicated on the scale. To the tube is connected a branch pipe or tube provided with a whistle and an escape pipe, so that when the piston in the tube is forced up beyond a certain point, and if the water begins to get low in the boiler, the whistle is blown and the surplus steam finds an escape. The piston rod is adjustable by a screw, so that the point when this blowing-off or alarm will take place can be adjusted in accordance with the strength of the boiler. *Patent completed.*

1135. W. K. NEWTON. "Certain improvements in fish-hooks." (A communication.) Dated May 5, 1859.

This consists in arranging between the main hook, and connected to the same by two arms, a bait hook, so that by forcing the two arms up to a horizontal position the main hooks are spread open or set, the arms being so arranged that they cannot be forced open up beyond a horizontal position. The top portion of the main hooks is made elastic, so that by the action of this portion the main hooks when set will spring together directly a strain on the bait hook disturbs the horizontal position of the two arms, and thus hold the fish firmly. *Patent completed.*

H. JOHNSON. "Improvements in piano-a communication.) Dated May 5, 1859. tes to a peculiar construction and arrange- he "rest" and "bridge" of pianofortes, e impediments to the direct vibration of are obviated. *Patent completed.*

J. KELLINGLEY. "Improvements in the abricating the journals of the axles of engines, of carriages, and machinery." 6, 1859.

ntee uses what he calls a lubricating shield eference on the axle at the inner end of l. This shield is so formed that while it e escape of the lubricating matter at the rows up such lubricating matter into a from which it is conducted to any part of g intended to receive the lubricating he shield is formed of brass, gutta-percha, ia-rubber. We cannot quote the details. *Patent completed.*

ANGERSTEIN, R. CLEGG, and G. THOR- "Improvements in apparatus for obtaining rer." Dated May 6, 1859.

W. HART. "Improvements in photo- paratus." Dated May 6, 1859.

ists, 1, in constructing a photographic ame so as to admit of adjusting thereby the encil or mask on the prepared paper or d securing the same thereon as required. tructing the said frame so as to adapt it ; tablets or surfaces to be printed from ees. 3. In applying vulcanized india-rubber o back board for the prepared surface to o facilitate the bringing of the printing epared surfaces into the required close *Patent abandoned.*

WEIGHT. "An improved gas governor or " Dated May 6, 1859.

ntee governs or regulates the pressure by d diffusing the gas through a woven texture tton, silk, hair, or it may be a metal fabric iber or chambers to which the burner is the pressure of the gas at the jet of the eebly governed and regulated as required. *Patent completed.*

SIONAL PROTECTIONS.

Dated Oct. 18, 1859.

Darlington. Improvements in glass fur-

Dated Oct. 31, 1859.

T. Pitman. Improvements in the con- d forges. (A communication.)

Dated Nov. 7, 1859.

Grafton. Improvements in bell and other aratus to dwelling houses and other places, rovements are also applicable to knobs or d fastenings of doors, and the like.

Dated Nov. 12, 1859.

Howson. Improvements in bells and in their manufacture.

Dated Nov. 21, 1859.

Webster. An improvement or improve- ssure and vacuum gauges.

Whittle. Improvements in the manufac- e, and in machinery to be used in the said e.

E. Newton. An improved machine for and pressing bricks. (A communication.)

W. Lenox. Improvements in the manu- ships' blocks.

Dated Nov. 22, 1859.

Amaden. Improvements in the manufac- raw and other descriptions of hats and

White. Improvements in gloves. (A tion.)

B. Daft. An improvement in coating metal.

2645. C. G. Hill. An improved goffering machine, together with the apparatus connected therewith.

Dated Nov. 23, 1859.

2647. W. H. Ward. A system of signal flags.

2649. E. T. Hughes. Improvements in the manu- facture of a certain substance to supersede blasting powder. (A communication.)

2651. E. T. Hughes. An improved chemical com- bination to supersede blasting powder. (A com- munication.)

2652. J. T. Smith. An improvement or improve- ments in heating, puddling, and other reverberatory furnaces used in the manufacture of iron.

2653. B. Bagster. Improvements in means or ap- paratus for giving surface finish to paper, which im- provements are applicable to copper-plate and other printing, as also to embossing.

2654. T. Eastman. Improved means of raising the blades of screws employed to propel ships, and ap- paratus for getting at such screws, and for performing other operations under water.

2655. T. Lister. Improvements in the construction of sanitary privies and water-closets, part of which improvements is applicable as a tap for drawing off liquids.

2656. J. Knowles, jun. An improved apparatus for the prevention of accidents in winding from mines, which apparatus is also applicable for other similar purposes.

Dated Nov. 24, 1859.

2657. F. Preston and H. W. Garrett. Improve- ments in the construction of cartridges.

2658. J. Langford. Improvements in inkstands, and in combining with instands instruments for hold- ing and damping stamps, labels, and other articles.

2659. W. C. Manieco. Improvements in cop tubes used in machinery for spinning fibrous substances.

2660. F. Prince. Improved apparatus for reducing the resistance of the atmosphere to the progress of railway trains.

2661. J. Fyfe. Improvements in apparatus for regulating and adjusting the flow and pressure of liquids.

2662. W. Eassie. An improved joint for boarding and planking of all kinds.

2663. A. Hubart and V. Cantillon. Improvements in the manufacture of casks, barrels, and other like vessels of glass, and in machinery or apparatus em- ployed therein.

2664. W. S. Losh. Improvements in the manufac- ture of paper, and in the preparation of a substance to be employed therein.

2665. W. S. Collins, jun., and F. J. Chard. Im- provements in apparatus for propelling vessels.

Dated Nov. 25, 1859.

2667. C. I., and J. Smith. Certain improvements in looms for weaving, and in apparatus for cutting the loops to form pile fabrics.

2668. T. Carr. Improvements in arrangements and mechanism for drying glue, moulded clay, sugar, white lead, and various other substances and articles of manufacture.

2669. J. Sim. Improvements in measuring and registering the flow or discharge of liquids.

2670. I. A. Read and W. Rennie. An improve- ment or improvements in connecting brooms with their sticks or handles.

2671. H. Lindon. Machinery or apparatus for raising and forcing fluids, which is also applicable for other useful purposes.

2672. M. Tildesley. Improvements in locks and latches. (Partly a communication.)

2673. G. E. Donisthorpe. Improvements in ap- paratus for hackling, dressing, and combing silk waste, and other fibres.

Dated Nov. 26, 1859.

2674. A. S. Lukin. Improvements in apparatus for drawing window blinds.

2675. F. Scheithauer. An improved machine for printing woollen and other fabrics.

2677. C. Bedells. Improvements in the manufac- ture of shoes and boots, and in fabrics suitable for use in this manufacture.

2678. W. Moseley. Improvements in fountain pens.

2679. M. Auerbach. Improved apparatus to be applied to omnibuses, stage-coaches, and other similar vehicles, to indicate the distance each passenger travels and the amount of his fare. (A communica- tion.)

2680. T. Watson and G. Healey. Certain improve- ments in the manufacture of silk velvets.

2681. M. Auerbach. Improved apparatus to be applied to cabs, hackney-carriages, and other similar vehicles, to indicate the number of persons carried,

the distance travelled, and the amount of fares. (A communication.)

2682. W. Mac Naught and J. L. Taylor. An im- proved method of increasing the temperature of water for feeding steam boilers or vessels for gener- ating steam, and in apparatus connected therewith.

Dated Nov. 28, 1859.

2683. J. Eastwood. Improvements in steam ham- mers, and in valves to be used therewith.

2684. J. Eastwood. Improvements in lathes.

2685. E. Tomey. Improvements in apparatus for insulating telegraphic wires or conductors.

2686. A. W. Williamson and L. Perkins. Improve- ments in machinery for propelling vessels.

2687. T. Luck. Improvements in apparatus for removing straw from thrashing machines.

2688. P. R. Hodge. The treatment and use of a new material in making of paper or other compounds of vegetable pulp.

2689. E. H. Bentall. Improvements in machinery for cutting vegetable substances.

2690. E. H. Bentall. Improvements in apparatus for crushing or grinding grain or seeds.

2691. J. Bower. An improved method of pre- paring clay for the manufacture of crucibles, pots, and earthenware.

2692. C. Sells. Improvements in steam-engines.

2693. R. A. Brooman. An improved poultry wagon. (A communication.)

2694. R. A. Brooman. Improvements in the pre- paration of red colouring matters or dyes. (A com- munication.)

Dated Nov. 29, 1859.

2695. F. H. Wenham. Certain improvements in steam-engines.

2696. H. Sharpe. Improvements in the mode of preparing wool for the purpose of carding or combing it with a view to its being afterwards wove into thread. (A communication.)

2697. J. King and J. Sutcliffe. Certain improve- ments in and applicable to mules for spinning.

2698. H. O. Robinson. Improvements in ma- chinery and apparatus for the manufacture of sugar.

2699. J. B. Berger. An improved mode of and ap- paratus for facilitating the calculations required for navigating ships or vessels.

2700. L. N. Dejean. Improvements in hydraulic motive power.

2701. C. Colwell. An improved means of propelling sea-going vessels without the use of either paddle- wheel or screw propeller now adopted.

2702. T. Richardson. Improvements in the manu- facture of certain compounds of soda and potash.

2703. M. L. J. Lavater. Improvements in vul- canised india rubber bands.

Dated Nov. 30, 1859.

2705. T. Fitton. Improvements in the slide valves of steam-engines.

2707. S. Mortimer and G. Swaine. Improvements in machinery or apparatus for spinning and doubling wool or other fibrous substances.

2709. J. M. Wilson. Improvements in finishing woven fabrics called Arabian stripes or scarfs.

2711. J. B. Teil. Improvements in the construc- tion of umbrellas and parasols.

2713. G. J. Firmin. Improvements in the manu- facture of tartaric and citric acids, and certain salts in connection therewith.

Dated Dec. 1, 1859.

2717. C. A. Fournier. A process and apparatuses intended to find out the escapes of lighting gas from the conveying pipes, and to determine the precise leaking places of the said pipes.

2719. T. Silver. Improvements in apparatus for governing or regulating the speed of steam and other engines.

2721. T. Till. Improvements in machinery for the manufacture of horse-nails and other wrought nails.

2723. J. Paton. Improvements in valves.

2725. J. H. Johnson. Improvements in apparatus for preserving and cooking food. (A communication.)

PATENTS APPLIED FOR WITH COMPLETE SPECIFICATIONS.

2731. G. F. Smith. Improvements in smelting and purifying iron and other ores. (A communica- tion.) Dated Dec. 2, 1859.

2740. J. Anderson and J. Bradshaw. Improve- ments in the construction of the furnaces of bakers' ovens for the purpose of consuming smoke, which im- provements are also applicable to the consumption of smoke in other furnaces. Dated Dec. 3, 1859.

NOTICES OF INTENTION TO PROCEED WITH PATENTS.

(From the London Gazette, Dec. 13, 1859.)

1719. J. G. Isham and S. D. Albertson. Corks. (A communication.)
1779. J. Rowland. Mashing and mixing.

NOTE.—Specifications will be forwarded by post from the Great Seal Patent Office (publishing department) on receipt of the amount of price and postage. Sums exceeding 5s. must be remitted by Post Office Order, made payable at the Post Office, High Holborn, to Mr. Bennet Woodcroft, Great Seal Patent Office.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

SWORDS AND SCABBARDS, India Office.—For swords and scabbards. Conditions of contract at the Secretariat Office. Tenders before 11 o'clock a.m., Dec. 03.

CHURCH, Norton Malwood.—For the rebuilding of Norton Malwood church near Bristol. Drawings, &c., offices, Mr. James Wilson, architect, No. 1 Belmont, Bath. Tenders, Dec. 21.

TOWER AND SPIRE, Moreton-in-the-Marsh.—For a new tower and spire to the parish church. Plans, &c., after Dec. 19, to T. Commaline, Esq., Moreton-in-the-Marsh. Tenders to 3 p.m., Jan. 2.

WORKHOUSE, Bristol.—For enlarging the City of Bristol Workhouse at Stapleton. Printed forms of tender, Mr. W. B. Wilnot, clerk to the guardians. Plans, &c., at St. Peter's Hospital, Bristol. Tenders, Jan. 11.

ENGINEER'S WORK, Bristol.—For the engineer's work to be done in enlarging the City of Bristol Workhouse at Stapleton. Form of tender, Mr. W. B. Wilnot, clerk to the guardians. Plans, &c., St. Peter's Workhouse, Bristol. Tenders, Jan. 11.

PLAN OF DRAINING, &c., Eastbourne.—For the best plan of draining the parish of Eastbourne. Map of parish, plan of additional buildings, levels, &c., Mr. M. G. H. Crampston Coles, clerk to the board, Eastbourne. Plans to be accompanied with a specification of the work to be done, and estimate of the cost, and sent to the office of the clerk, Jan. 17.

RAILS, Dublin and Wicklow Company.—For 4,400 tons of bridge rails 80 lbs. to the yard, for the Gorey Extension line, with a proportionate quantity of chairs, according to particulars with the company's engineer, W. R. Le Fann, Esq., 59 Fitzwilliam-square, Dublin, to be delivered free on shore at Wicklow or Arklow, in three equal quantities of 6, 12, and 18 months, from date of acceptance of tender. Tenders to Mr. A. Moore, secretary, 48 Westland-row, Dublin, Dec. 29.

CHAIRS, North British Railway Company.—For 2,300 tons of chairs. Specifications at the head office of the company, Edinburgh. Tenders for whole or any part before noon, 23rd inst.

RAILWAY MATERIALS, Border Counties Extension Railway.—For the following materials for permanent way, viz.:—23,000 sleepers, 50,000 chairs, 50,000 keys, 112,000 twisted spikes, 16,000 fishing plates, 32,000 fishing bolts. Forms of tenders, offices, Mr. J. F. Tunc, 10 Market-street, Newcastle. Tenders, 22nd inst.

STOCKS, Rythe and Tyne Railway.—For wagon wood, and other home and foreign timber, for iron, copper, brass, nails, spades, shovels, bolts, &c., and for other stores for the ensuing year. Forms of tender, &c., Mr. Lundie, manager, Percy Main, or at company's offices, Newcastle.

FREIGHT TO INDIA, Calcutta and South Eastern Railway.—Freight for two locomotive engines and tenders, in a first-class vessel, from Newcastle-upon-Tyne to Calcutta. They will be ready for shipment in the beginning of January next. The tenders to specify a lump sum for the conveyance of each locomotive and tender; the weight and dimensions of which to be ascertained at the offices of the company, 211 Gresham-house, Old Broad-street, or at Messrs R. Stephenson and Co.'s, Newcastle-upon-Tyne. Tenders at the office of the company till noon, Dec. 24.

GASHOLDER TANK, Rarrestall.—For the excavating, shorting, puddling, and mason's work required in the construction of a gasholder tank, 80 feet diameter by 20 feet deep, at the company's works, Bacup. Sealed tenders to be furnished by the secretary, and sent in to J. Aikin, Esq., chairman, 28th Dec. inst.

CHURCH, Newcastle-upon-Tyne.—For the erection of a new church in Bath-lane, Newcastle. Drawings for and copies of quantities, Messrs. Oliver and Lamb, architects, 66A Northumberland-street, Newcastle. Tenders, Dec. 19.

CHURCH, Dover.—For building a new church for the parish of St. James the Apostle, Dover. Drawings, &c., office of Mr. T. Fox, vestry clerk, 3 Castle-terrace, Dover, where copies of bills of quantities and forms of tender

may be obtained on payment of a sum of three guineas for each copy. Further particulars Mr. T. Bury, 50 Welbeck-st., Cavendish-sq., London. Tenders, Dec. 21.

SCHOOLS, Essex.—For the erection of three large schools and residences at Epping. Plans, &c., Offices of Mr. O. E. Pritchett, 12 Bishopsgate-street Without, and Messrs. Stortford; also, at Rev. J. R. Tuck's, Epping. Tenders, Dec. 23rd.

DESIGNS AND ESTIMATES FOR SHOP AND HOUSE, Hull.—Designs for a draper and silk mercer's shop and dwelling house on the site of the shop and retail premises, in the Market-place, Hull. Premium of ten guineas for most approved plan, to Messrs. R. Jennison & Son, drapers, Hull, Dec. 19.

ENGINEER, Practical and Educated, to erect and superintend the working of sugar and other machinery. A thorough practical knowledge of the steam engine and millwright's work, and having served the regular time in the shop, is indispensable. A competent person, producing first-class references as to ability, character, &c., will be liberally dealt with. Address, P. & Co., 163 Strand, stating all particulars.

GAS ENGINEER.—Must be thoroughly acquainted with engineering in general, but gas engineering on a small scale in particular, in all its detail. Must be a good draughtsman and accountant, and capable of preparing specifications of brick and wood work, as well as iron work. Salary, £100 a year. References to three last employers required. Address, V. 36, Examiner office, Manchester.

GAS ENGINEER.—The Sowerby Bridge Gas Company require the assistance of a practical gas engineer to examine their works, and report to them his opinion as to the best mode of enlarging the same. Address, stating terms and reference, to the Chairman of the Company, Sowerby Bridge, Yorkshire, Dec. 19th.

MANAGER OF GAS WORKS.—To take the management of the Todmorden Gas Works, and to do the general business of a gas-making establishment. Address, Mr. J. Barker, engineer, Millwood, Todmorden, giving references and salary required.

MANAGER FOR ENGINEERING WORKS.—Must be a good mechanic, thoroughly systematic in conducting and getting out work, and a fair draughtsman. Applicants to give full particulars of previous engagements and references. Salary, £120 a year. Address, X. O., 163 Strand, London.

MECHANICAL AND TOPOGRAPHICAL DRAUGHTSMAN.—One thoroughly competent to go out to Rio de Janeiro. A German, Swiss, or Pole, who can speak English, will be preferred; salary liberal. Address, Messrs. Fairbairn & Sons, Canal-street, Manchester.

MECHANICAL DRAUGHTSMAN.—One experienced in making working and finished drawings, capable of designing and arranging machinery, and possessing a practical knowledge of mechanical engineering, millwrighting, &c. Address, stating salary, L. T. G., 163 Strand, London.

BRASS TUBE MILL MANAGER.—To superintend a brass tube mill. Must be experienced in making both solid, drawn, and brazed brass and copper tubes, and thoroughly understand the nature of metals. Address by letter, H., 3 Journal office, Birmingham.

SECRETARY AND GENERAL MANAGER, Halifax.—For the Halifax Mechanics' Institution. An active intelligent man, who will be expected to devote his whole time to the duties of his office. He will be responsible for the efficient working of the several departments of the Institution, and arrangements will be made for the purpose of giving him a pecuniary interest in its prosperity. The salary will be £100 per annum. Application by letter only, not later than 20th inst., to Mr. Corke, secretary.

THE
MECHANICS' MAGAZINE.

LONDON, FRIDAY, DECEMBER 23, 1889.

OUR NATIONAL DEFENCES.

THERE is a wonderfully simple means of defence accessible to us English people that has been many times suggested by individuals, but never, we believe, taken into serious consideration by the authorities. We allude to the adoption of locomotive batteries, transportable from place to place around our coast on lines of railway. The Professor of Fortification at Addiscombe, Admiral Sartorius, and Mr. Bridges Adams, (in *Once a Week*;) have all and severally proposed the employment of such a system of defence; and only last week we learned that Mr. John White, the eminent shipbuilder of West Cowes, Isle of Wight, no less than two or three years ago devised elaborate plans of carrying this system—which he seems to have been one of the very first to devise—into effect.

Knowing as we all do, or may easily do, every assailable portion of our coast, and possessing as we possess the power of rapid transit which railways afford, it seems the height of folly to invest large sums of money in fixed defences. What could be easier than the simple process of connecting all or several of our assailable points by trunk lines of railway—placing upon, or in connection with them, a sufficient number of guns to meet every possible emergency—and furnishing ourselves with such an amount of locomotive power as would enable us to concentrate as many of our guns as we please upon any threatened point in a few hours? Taken broadly, it is possible that on close inquiry it would be found that no impediment would prevent us from suddenly concentrating all the strength of our coast artillery upon a single point if desirable; but even if such obstacles as the mouth of the Thames, the Southampton Water, Plymouth Sound, and other estuaries, were found to render this impracticable or undesirable, there could yet be no difficulty in bringing an overwhelming artillery force to bear upon every point where an enemy could land.

The advantages of such a system of defence must be very great. In the event of any attempt at an invasion being contemplated, we could put all our defensive artillery force into a state of preparation, and on the approach of the enemy, the telegraph would at once put every division of the force on the alert. No feints of the enemy could avail him anything, because our locomotive land force could be shifted from point to point, as he varied his position, with much greater facility than fleets of transports could be moved. On the actual landing being attempted, we should have the invaluable power of taking up whatever position we found best—either directly in the face of the landing force, or at any convenient distance from it, taking it more or less as opportunity served. Surely with the fleets of England afloat, and defences of this kind girdling our coast, we might lay down our heads at night in any corner of our happy island fearless even of Imperial France!

In times of peace our coast artillery might be maintained at exceedingly little expense—at the mere cost of the guns and carriages, in fact, for the locomotives, and even the railways,

might then be used for civil and commercial purposes. Such artillery could, moreover, be worked with all needful efficiency by volunteer forces formed along the coast, and, if necessary, batteries of guns could be transported from place to place to afford opportunities for all the corps to exercise themselves with by turn.

THE GREAT EASTERN.

A FREE press is a blessed thing unquestionably, but it often works much mischief. We do not, we are happy to say, believe that newspaper writers can repeal or set aside the laws of nature—fortunately for us; but they can do marvellous things in the way of casting discredit upon human enterprises even of the highest kind. What wonders have they not worked lately in reference to the Great Eastern? The design of that ship, in all its essential parts, has been before the scientific public for several years, and we never yet knew of any serious criticism adverse to it proceeding from any distinguished men of science. Men of science, moreover, have lately made two or three trips on board of her, and have discovered nothing seriously defective about her, so far as we have heard. But newspaper writers have done what men of science did not do, and their clever disquisitions, aided by some singular proceedings on the part of the directors of the Great Ship Company, have brought the shares down ridiculously low.

How far there is room to doubt whether Mr. Scott Russell's late contract was fully and faithfully completed or not we cannot tell, simply because we never saw the specification of the contract, and have not the slightest knowledge of its extent or limitations. We know, of course—as everybody else knows—the directors themselves long ago announced that the contract was finished entirely to their satisfaction. But since then the question has been raised, and has very properly been submitted to the decision of duly appointed arbitrators. While these arbitrators have been investigating the subject we have seen and heard much on one side of the question, while on the other side Mr. Russell has maintained silence. For our part, while we know that an immense amount of nonsense has been written about the condition of the ship, and while we further know that Mr. Russell spared no expense in performing his contract, we shall not be surprised to find that he gets mulcted to some extent by the arbitrators, simply because we believe no considerable quantity of contract work can be expected (in the present state of commercial and manufacturing affairs) to stand close scrutiny unblemished. But however this matter ends, it can bear but very slightly upon the actual value of the Great Eastern. Mr. Russell's last contract may have been well done, or it may have been ill done, but that is a mere question of a few hundred pounds at most; the value of the ship as a commercial instrument or agent cannot be greatly affected by it. As to the folly which we hear and read, about the paddle-engines being placed too low, and other such matters, no scientific man will give heed to that for a single moment until something more than gross absurdities are brought forward in support of it. We say this, not with the slightest disposition to check any sensible discussion of the great ship's construction and qualities; on the contrary, we will gladly open our columns to any scientific letters or papers on the subject; but we say it because we have not patience to comment upon the utterly senseless writings which have recently appeared in imposing forms in reference to the Great Eastern.

Holding these views—which we know must

be shared by all our professional readers—we have observed with satisfaction that Mr. William Hawes, a highly influential member and officer of the Society of Arts, has just been laying before that Society a valuable paper upon the Great Eastern. In this paper the writer opportunely recalls public attention from the "petty jealousies of little minds," and from the "misrepresentations of ignorant and interested opponents," and directs it to the ship as "a great mechanical and engineering work, fraught with great commercial and political results, the accomplishment of which may be retarded by bad management, but which will certainly be ultimately realized, however gloomy for a time the prospects may appear." For the sake of a magnificent ship, which only its owners take pains to undervalue, we are pleased with Mr. Hawes' undertaking, and will glance at her anew in the light which he throws upon her.

There is much truth in what Mr. Hawes says in reference to the present management of the ship. No one, as he observes, appears to have sufficient authority to decide what is to be done, and few of those who are now connected with the administration of the company's affairs appreciate the vastness of the original design, fewer still being able to carry it out in its integrity. Judging from the criticisms we have all read upon the ship of late, we might fancy, he remarks, that neither of the experienced engineers of the paddle and screw engines knew anything of their business; for one critic says the chimneys are too small; another, the boilers are insufficient; another, the diameter of the paddles is too great; another, the air-pump rods are too weak, and the engines themselves are in the wrong position; another finds fault with the donkey engines, and so on throughout the ship, "all of which criticisms seem rather to originate in a desire to spend the money of the company, or to obtain a false reputation by appearing to remedy evils which do not exist, than to complete in the shortest time the work that is unfinished, and to remedy, in the most economical manner, any defects in her machinery and apparatus which her trials may have rendered apparent." There is also much truth in his remarks upon the gorgeous and expensive fittings of the principal saloon. He believes the interests of the shareholders, and good taste, too, would both have been better consulted, if the utmost simplicity in ornamentation had been adhered to, and more attention paid to the introduction of the comforts we are accustomed to ashore, and which the steadiness of, and the space at command in, this ship would have enabled the directors to realize, to the infinitely greater satisfaction of passengers than any pleasure that sitting in a gaudy saloon can afford them. He also notices a remark which has been made respecting the absence of means to warm the state room and other saloons in a ship going to America. The ship was never intended to go to a cold climate; she was built for the Indian trade; she is not calculated for a voyage to America, and it is to be very much regretted that the concession to other interests than those of the shareholders, and perhaps the desire of exhibiting this great work to our transatlantic friends, should have been allowed for one hour to delay her departure on the voyage for which she was designed, for which she is fitted, and from which alone commercial results to the company can be realised. "The ship has been looked upon too much as a sight, and far too little as a great commercial machine by the proper use of which alone can profits be made." It is clear, he adds, that one great element of commercial success is to be found in

not allowing this great capital to be idle in port; another in avoiding, as much as possible, the dangers of passing to and from any coast, whereas by sending her to America the delays in port must be tenfold her time on the voyage—indeed so long that smaller steamers will fill with passengers and cargo and make the passage while she is loading, if indeed she ever will be loaded there. The whole object of the enterprise will thus be defeated, capital will be uselessly lying idle, and wages and expenses will be as uselessly paid. Then, again, as to the risks incidental to the voyage. We all know how comparatively small they are in a well-found ship when once at sea, and most are equally well aware of the risk in approaching the English and American coasts, of the fogs and ice incidental to the vicinity of the one, and the dangers of our rocky shores and narrow seas. "I never have been able to understand," says Mr. Hawes, "why the directors determined to send this ship even one voyage to America, or to spend the large sum they have done in fittings before the ship and machinery had been tried, and the speed of 15 or 16 knots per hour, which none doubt will be accomplished, had been proved to the satisfaction of the world. I have always maintained that, as soon as she was launched, and the machinery completed, by which I mean everything required for her safe navigation, sufficient ballast and coal should have been shipped, and a voyage of 1,000 or 2,000 miles performed, with or without her masts. If that trial had been successful, money would have been easily raised to finish her in any style the builder or directors might have chosen; if a failure, the shareholders would have saved the £100,000 spent in fittings and ornament." We need hardly say how entirely and cordially we agree with these remarks.

The fact is, there is no visible hope of doing anything useful with this ship until the object with which she was designed and built is once more set before her proprietors. How will she answer for the passage to India?—answer, that is, in a commercial sense? is the one inquiry which should be resolved with all possible haste. If she can accomplish what her designers promised, there can be little doubt, as Mr. Hawes remarks, that a fleet of such ships will soon be built, and a visit to India *via* the Cape will become one of our holiday trips, the passage being performed in a luxurious hotel instead of by the overland route, which "concentrates in a journey of six weeks as much discomfort as it appears possible to experience in so short a time." Mr. Hawes states the conditions of the question in the following manner:—The cost of a passage to Calcutta is now £102, and, excepting servants, is limited to 1st class. If the Great Ship Company, relying on her size and economical arrangements, boldly meets the wants of the time, and charges but £60 for a 1st class, £40 for a 2nd class, and £25 for a 3rd class passage, and freight at proportionately low rates, its annual earnings and expenditure—so soon as her speed is proved, and making two voyages only—may be estimated thus:—

INCOME OUTWARDS.			
400 passengers	at £80	£24,000	
500	at 40	20,000	
3,000	at 25	75,000	
10,000 tons of cargo	at 3	30,000	
INCOME HOMEWARDS.			
300 passengers	at £80	£18,000	
300	at 40	12,000	
2,000	at 25	50,000	
10,000 tons of cargo	at 3	30,000	
		259,000	
Two voyages—annually		518,000	

EXPENDITURE.

Two Voyages—Coals	£280,000
Officers, Engineers, Crew, &c., wages ...	20,000
Dietary for Crew and Passengers	60,000
Engines, Oil, &c.	5,000
Working Expenses	50,000
Wear and Tear	50,000
Depreciation	50,000
Insurance	50,000
	365,000
Balance or Profit	153,000
	£518,000

No estimate is made of the receipts likely to be derived from mails, parcels, or specie. But exclusive of these sources of income there can hardly fail to be, if this amount be even near to correctness, an ample return to the shareholders, and if the wear and tear be estimated at the cost of the ship to the present company, the result will be much more favourable; but Mr. Hawes has estimated them upon what he assumes would be the cost of a second or sister ship. He considers there will be no difficulty in obtaining a sufficient number of passengers or tons of freight to fill the ship so long as we are annually exporting to or importing from India £15,000,000 to £20,000,000 value of manufactures and merchandise, and employing hundreds of thousands of tons of shipping, especially when we recollect that the line by these ships will be a trunk or feeding line to the whole of our Indian empire and the Eastern world. The cargo of 10,000 tons at high rates will consist of the first-class goods required at every port to which we trade, and the advantage to merchants on either side, whose intelligence and good information enables them to foresee a coming demand before it actually arrives, of receiving goods by a conveyance as quick and regular as that which conveys the orders, cannot be overrated. At present orders are received by the overland mail to be forwarded by sea, the shipment of which is notified to every one by our Customs' reports, and frequently in time to enable merchants having no similar orders of their own to make shipments on the faith of the known intelligence of others, which goods may arrive as soon, or perhaps sooner, than those shipped by the parties by whom, in anticipation of a demand, orders were first transmitted to England by the overland route. To ensure the earliest possible arrival of goods after the receipts of orders will command, Mr. Hawes argues, an amount of freight which this ship, capacious as she is, will hardly be able to carry. Commercially, then, the establishment of a trunk route which shall combine speed and comparative cheapness, must command as large a share of business as can be undertaken by a fleet of such ships to sail monthly from either terminus. It appears to him almost impossible to appreciate, much less to estimate, the effect of thus reducing the distance between England and India; even the effect produced upon the home trade by the introduction of railways, or the increased facilities for our correspondence by the joint effects of penny postage and railway conveniences, invaluable and startling as they are, or the daily increasing traffic between England and America, since 1838, when the first passage was made, to the present time when steam-boats are running almost daily, offer but poor means of estimating the advantages to be derived from bringing several hundred millions of fellow-subjects and their wants within a few days of our shores. Surely, as he says, support ought not to be wanting to aid in overcoming the difficulties attending the commencement of so vast an undertaking for when once the fact is established means will soon be found to develop it more fully.

Much misconception, owing no doubt to a vague idea of the real distance to Calcutta, to the great length of time occupied by clipper ships and auxiliary steam-ships in the voyage, and to the apparently (as compared with them) very short time given to the Great Eastern, has got possession of the public mind as to the speed per hour necessary to accomplish the duty undertaken. The speed proposed by Mr. Brunel in the first-published prospectus, in 1852, was that "which experience proves such vessels to be capable of, and which will perform the voyage easily in 32 days." To do this he determined to employ engines of 2,600 horse power, consuming from 250 to 300 tons of fuel per day, and 15 knots per hour is stated by him as the required speed. Is this rate likely to be realised? "The trials prove," says Mr. Hawes, "as far as they go (the engines never having been worked to full speed), that after a little working, when everything is in order, this rate will be attained." He then argues,—the distance to Calcutta is 11,819 geographical miles or knots; the time to Calcutta by Peninsular and Oriental ships, 38 to 40 days; time to Calcutta *via* Marseilles, 34 to 36 days; time to Calcutta by Great Eastern at, per hour, 16 knots, 31 days; 15 knots, 33 days; 14 knots, 35 days; 13 knots, 38 days; cost of first-class passage by Peninsular and Oriental boats and rail, £102; do, per Great Eastern, £60; Luggage for each passenger (free) 336 lbs. per Peninsular and Oriental; do., 40 cubic feet per Great Eastern; charge for extra luggage per Peninsular and Oriental boats at the rate of £36 per ton; do. per Great Eastern, say £12 per ton; trade to India—Tonnage cleared to Calcutta, Madras, and Ceylon (1858), 294,162 tons; estimated annual value of trade to India, per annum, £15,000,000 to £20,000,000. From 12 to 15½ knots have already been done with a maximum rate of 12½ revolutions of the paddle and 40 of the screw engines per minute; give them 16 and 48 respectively, and more than the anticipated duty will be done.

In comparing her speed with that of our large ocean passenger ships supported by large Government subsidies, it must not be forgotten that while by this ship it was proposed to accomplish a higher average ocean speed than has yet been attained, it was also calculated to carry so many passengers and so much freight that it should be worked profitably without subsidy, the sum annually paid by Government to mail steamers being £982,000; of which £167,125 is paid for the Indian route; £204,000 is paid for the Australian; £172,840 is paid for the American; and £244,000 is paid for the West Indian. In every other fast passenger ship the coals and engines, even for a short voyage, occupy so much of the ship that but little freight can be carried, and only a limited number of passengers in proportion to the size of the ship, and these mainly of the first class. "They occupy the same relative position in ocean travelling to other steamers that the fast coach or the mail did to the six-insider of former days. The one quick used only by the rich, the other slow, but paid for by the public." Railways, continues Mr. Hawes, have abolished this distinction ashore; rich and poor travel at nearly the same speed, though at varying rates; and this great ship is the first step in the same direction afloat. Mail coaches required subsidies; by rail the mail is carried at rates scarcely equal to the actual cost of transit. So the mail steamers now built cannot run without subsidies; "and as the rail has beaten the coach, so we hope in this ship to beat the subsidised mail steamers in speed and economy, and thus to secure large public support, which is of in-

"finitely more value than a Government subsidy. The one tends to check progress so long as a contract continues; the other stimulates and encourages it, because it rewards every improvement." At 15 knots per hour this ship will reach Calcutta in 32 days, and at 16 knots in 30 days and 12 hours, with a consumption of fuel, when the aid of trade winds and favourable monsoons is allowed for, not exceeding 280 tons per diem. We may fairly expect from what has already been done, that when everything is in order, and all hands, from the captain to the stoker, are up to their work, and the engines do the duty assigned to them, this speed will be attained, and the distance accomplished in the time originally contemplated. Extra speed can only be attained by the displacement of passengers and cargo; and it is the skill with which the space allotted to machinery—the source of expenditure, and that allotted to passengers and cargo—the sources of income, have been determined, that forms the best ground of our hope that this ship, when the first difficulties of starting so novel an undertaking are overcome, will be a great commercial success. Disturb the one, and the rates for the other two must be increased, and our surest element of prosperity destroyed. These facts are strikingly illustrated by Mr. Hawes, who compares some of our largest passenger ships with the Great Eastern, thus:—

Ships.	Tonnage.	Horse-power.	Coals per Day.	Speed per Hour.	Cost.	Stow of Coals for	Carrying Power for Passengers and Cargo.
Great Eastern	22,500	2,600	300	14	650,000	dys. 40	Passes. 4,000 Tons. 10,000
Atrato..	2,720	800	95	11	105,000	15	194 300
Shannon	3,092	800	92	11	120,000	15	258 450
Persia..	3,585	1,000	140	11	140,000	14	350 400

Or, as compared with the average of these three ships.

The Great Eastern has cost	...	5 times as much.
" " " is	...	7 times larger.
" " " has	...	3 times the power.
" " " has at 14 knots	1.22 times the speed.	
" " " carries 40 days' fuel	against 15.	
" " " has carrying or commercial power	for passengers 15 times greater.	
" " " for cargo	28 times greater.	

In all these ships—and they fairly represent the subsidised mail and passenger ships—it will be seen that the quantity of cargo carried is trifling in proportion to their size, and that the expenditure of coals in proportion to size and speed is enormous; and whilst, with a horse-power of 1 to 3 or 4 tons of burthen, they give an average speed of only 11 knots per hour, the Great Eastern, to run 15 knots, has but 1 horse-power to 8½ tons burthen. Mr. Hawes sums up thus:—"This then is the measure of the advantage gained by her beautiful form, great size, but comparatively small steam-power. We have a higher speed by a vessel 7 or 8 times larger than any afloat, than has yet been attained—capable of carrying from 5,000 to 10,000 passengers, or 4,000 passengers and 10,000 tons of cargo; burning per hour but three times the quantity of coals now used by ships one-eighth her size, and carrying fuel for 40 days steaming instead of for 15 days—can any one doubt this being a great advance in ocean steam navigation? Railway speed was never the object of the engineer, but large carrying power with great safety, at a speed to accomplish the distance to India in the same or in less time than by the overland mail route, with the economy of ordinary clipper ships, was his object, and, as far as we can see, it appears likely to be fully realised."

We cannot pass over without a few words the last portion of Mr. Hawes' remarks—those

on the national importance of this great undertaking. At present, the most rapid means of intercourse with our Eastern possessions is through France, across the Mediterranean, and through Egypt by the Red Sea to the Persian Gulf. This route can be stopped at any moment by the Emperor of the French. The next in shortness is by sea to Alexandria, which can be very much endangered by French fleets, and thereby deprived of its certainty and safety, besides the risk attending the transit through Egypt. Such are the difficulties and expense of this route, that it can only be maintained by aid of an enormous subsidy from the Government, and even then with very high charges for the conveyance of passengers and small parcels; to commerce it is entirely inaccessible. The charge by the Peninsular and Oriental Company is, by sea to Calcutta, £102, and the ordinary time required to reach Calcutta is 38 days, or four days less at an extra charge, *via* Marseilles. The Great Eastern, therefore, will forestall the arrival of the Peninsular and Oriental boats, by several days, at Calcutta, and this without subjecting either letters or passengers to the risks and inconveniences of three times passing through foreign countries, or to being transferred from one conveyance to another, or to being interfered with from political disagreements between France and ourselves. By such means, then, may our Eastern possessions be brought not only so many days nearer to us, but the communication be rendered more safe than, and equally certain as, by the existing routes. Every one must at once see the importance of thus reducing the distance as measured by time between India and this country, especially if at the same time we afford infinitely superior means than now exist for transporting an almost unlimited number of troops and material or merchandise to and from any part of our distant possessions.

One Great Eastern will not suffice, probably, either for commerce or the Government, when her power and speed are fully proved. The objection made by many that it would not be prudent to put 5,000 or 10,000 troops in one bottom is, as Mr. Hawes observes, most futile. Let it be proved that this conveyance is the safest, the quickest, and most certain, and the objection fails at once. Experience has fully proved that large ships are safer than small ones, and no one ever thinks of refusing to take a passage in a good ship because she carries a large number of passengers.

SILVERTOWN.

An important social "experiment" is at present being simultaneously tried in various portions of the British dominions, and is watched with considerable interest by true and zealous philanthropists. We allude to the foundation of training schools, where a solid but plain education, and a knowledge of the manufactures carried on around, go hand in hand in fitting the offspring of the men employed upon the works, of both sexes, for their future independence and well-being. The enormous factories at Saltville, for the manufacture of woollens, the extensive glass-works of Messrs. Chance and Co., near Birmingham, and the extensive producing resources at Silvertown, opposite Woolwich, are successfully developing results in the highest degree encouraging to the permanent unity and good fellowship of the employer and the employed.

The impression left upon our minds by a visit to the latter place, which, through the courtesy of the Messrs. Silver, we thoroughly inspected, was one of a very promising description, arising from

the undisguised cheerfulness and systematic order which appeared to reign throughout the varied ramifications of this vast concern. Indeed, although the proprietors with commendable modesty consider it an *experiment*, our belief, from no little experience in such matters, would lead us to pronounce it a *fait accompli*, and one which is eminently deserving of the most serious consideration of those who are unselfishly devoting their minds, both privately and legislatively, to the welfare of succeeding generations. The manufactures pursued at these works, which stand on ten acres of ground, are manifold in their character, and rise by almost imperceptible degrees from the merest mechanical application of the fingers alone, to matters which are engaging the most gifted minds in these days of rapid intellectual progress; from the punching of holes in wood, in metal, or in composition, and the cane-bottoming of a chair, to the highest branches of practical science. It is impossible to conceive an area more fraught with promise; for there exists an appropriate sphere within reach of every capacity, be that capacity mental or mechanical, or both. In the school, which is a lofty, well-ventilated structure, we found some sixty children, boys and girls, the offspring of the work-people, under the tuition of a master and mistress, assisted by monitors selected from the more advanced of the pupils. In order not to tax their young energies too stringently, one half of the children is mentally employed, while the other half is mechanically so, and a liberal regard to out-door amusements in the field within the bounds of Silvertown healthfully tempers both exertions. Those of the children not in school are employed principally in minor portions of carpentry—in the caning of chairs, sofas, &c., for the cabins of ships and officers' outfits, and for domestic purposes in India and our colonies. It was interesting to notice the growing intelligence of the children in these branches of industry, the fingers of some plying the split cane in the reticulation of the seats of the chairs with a surprising celerity, while others, but young beginners, did and undid their work in evident mortification at their own incipient want of skill. Each child receives payment for its work according to its quality and quantity, and some of them, mere babes, obtain about six shillings a week for the short period of the day they are thus permitted to employ their time. It was obvious to us that this was a very happy state of things, showing a very far-seeing policy upon the part of the heads of the works, inasmuch as the child is not only reared to an independent position by the knowledge of a trade, while it is receiving that religious and moral education without which the greatest mechanical acquirements are rendered so often unstable, but the parents themselves working almost in sight of their offspring are relieved from that depressing and feverish weight of anxiety which is ever attendant upon the parental care of children not similarly provided for. These children, as they rise in mechanical acquirements, work immediately under their parents' eye, and in due time, in sickness or death, succeed to their positions and emoluments. A committee of taste, tending to bring out the latent talent of old and young, is amongst the noticeable features of this community; and from time to time plans and models are examined, and suggestions for the advancement or improvement of any of fourteen different descriptions of trades carried on at Silvertown.

town are examined and canvassed, and prizes awarded for those of a practical nature. A Mutual Improvement Society in connection with the former, gives unity and force to its other beneficial tendencies. The school-room serves as a temporary place of worship, a chaplain being appointed to the duty. This gentleman does not, however, confine his ministrations to these works, but extends them also to the numerous employes at the warehouses in Cornhill and Bishopgate, where social and religious meetings take place monthly, marked by appropriate addresses, prayer, &c. A mechanics' and news institute are likewise in full and useful exercise in one of these warehouses, in which classes for instruction are formed, and lists of sessional lectures printed and delivered by its members.

To return to Silvertown: the parents of this infant colony work at the more matured requirements of the factories, which are devoted to ponderous machinery of Herculean strength for the mastication of crude india-rubber, until that wondrous product acquires its perfect protean powers, and is converted into rick and waggon cloths, carriage aprons, macintosh and various waterproof garments, waterhose of almost endless lengths, air goods, such as life-boats, mattresses, cushions, inflated children's balls for play—a comparatively recently manufactured article of very extensive use. Buffers, washers and bearing springs now so extensively used for machinery, are here likewise turned out after the severest tests in almost fabulous quantities. The tenacity and power of resisting great weights as evidenced by these washers, as well as the buffers and packers similarly constructed for railway carriages, is something marvellous. The manufacture of hose for water pipes, &c., is another branch of this peculiar industry, which more than usually interested us, inasmuch as we saw no less than sixty feet of rubber placed around a mandrel or tube, and after being joined throughout the whole of this length, the entire mould or tube was withdrawn by one man with an ease and facility which at once proved how little friction must exist between metal and this extraordinary compound. This fact is surely as suggestive as it is curious. It is likewise within the precincts of these works that india-rubber is undergoing trials for the purpose of being enlisted yet more extensively as an important auxiliary for the more impervious insulation of electric-wires.

The houses already built at Silvertown are some fifty in number; they are without the gates of the works, and from external appearance seem to be inhabited by an industrious community, who intuitively entertain a high regard for almost a Dutch notion of cleanliness. The street is wide, well paved, drained and lighted, and in it we noticed a store for food. The latter we were informed was self-supporting, and each article being bought at trade price, and of the leading wholesale houses, its purity and economy are ensured. It is again retailed at a fractional advance of cost to meet the contingent expenses of rent, &c. A medical practitioner is also attached to the firm, and a sick fund has likewise been established under proper regulations, which not only brings with it a due amount of independence, as the men find in it a fund which provides for accidents, but absolves them from the necessity of seeking eleemosynary aid from their employers. The houses devoted to the chaplain, the manager, and principal clerks are within the gates, and are well built, commodious, and comfortable structures. Indeed, everything around bears the unmistakable impress of a well-organised system, which distributes industry, ease, and happiness over the largest surface.

Although the products of this industrial town are enormous in their aggregate, the warehouses in London take their share, and some hundreds of men, women, and the youth of both sexes, are there employed in the completion of shirts, knapsacks—both for military and touring purposes—belts, caps of all descriptions, toilet requirements, clothing, &c., &c., as well as the resources of a private outfitting trade for Great Britain, the mag-

nitude of which can best be judged of by a glance at the busy scene of the packer's department upon the basement of these establishments, where enormous cases are being labelled with their various destinations, and are constantly departing for shipping to almost every quarter of the world. This department, and the general sample room, where specimens of the manifold articles manufactured by the firm permit of the merchant selecting at once and giving his orders, perhaps best served to convince us of the magnitude of the manufactures carried on by the firm, to which we have to tender our thanks for the courtesy which thus permits us to afford our readers a slight, and, we trust, interesting insight into its workings.

ON HEAT.

EXPERIMENTS AND OBSERVATIONS TENDING TO PROVE THAT THE HEAT WHICH DR. BLACK DISCOVERED TO BE ABSORBED DURING THE LIQUEFACTION OF ICE, AND WHICH HE CALLED LATENT HEAT, IS NEVER GIVEN OUT AGAIN ON THE FREEZING OF WATER, WITH REMARKS ON A PECULIAR PROPERTY WHICH SEEMS TO BE DEVELOPED IN WATER AND MANY OTHER FORMS OF MATTER ON CHANGE OF STATE.

By HORATIO PRATER, Esq.

(Continued from p. 378.)

THAT the theory of the separation of atoms being the cause of cold is right, follows also from Sir J. Leslie's experiments on the exhaustion of air (i.e., separation of the space between its atoms). "The thermometer always suddenly sinks a few degrees* when in the receiver, (says Thomson, p. 108.) And the sudden rise to so great a degree when air is let in again, is also best explained by the theory now proposed. The density of air being .00003, Leslie found that the degree of heat produced by letting the external air rush into the receiver, so as to return to density 1, was so wonderfully great as 13,500° F., and even when the air was 0.2, was as high as 216° F. (p. 111.) Some heat in this case may be generated by the friction of rushing in, but the greater part is probably due to the atoms of air COMING CLOSER TOGETHER THAN USUAL, in consequence of their having been previously placed in an unnatural and forced state of VERY great separation. The degree of cold will be greater the greater the RAPIDITY of the action of separation of atoms, whether in the case of the solution of salts, or of the exhaustion of air, and vice versa, as regards the production of heat. But in both cases *rapidity of action* must be regarded as an essential element, whether of the production of cold or heat, only that the motions will be *inverse*; but the idea of *pressing out* or *drawing in* of an *ether* (the cause of heat) seems to explain the effect just as well (to say the least) as the theory of the *opposite motion of atoms*.

In the case of snow and water at 172° the more rapid and greater production of cold than when water at 32° is used, is also to be paralleled with the greater production of cold when snow and muriate of soda are used, than when water at 32° and muriate of soda are used. I have already stated that in this case the production of cold *certainly* greater than what the mere absorption of 140° can account for, is to be attributed to the natural action being hurried, and in the same way when snow is dissolved in water at 172°, I may ask whether, at least, part of the cold produced is not to be ascribed to a similar cause?†

I know that an attempt has very lately been

* Of course this separation of atoms is the cause of the cold produced by evaporation. It also explains why high pressure steam does not scald, at least when this is allowed to expand by rushing into the air. Also the freezing of water when this is put in anhydrous sulphuric acid in a red hot crucible, the separation of atoms being so quick and wide of the ether evaporating, while the fluid portion remains under 32° F. But as so little water is used when the hand moistened is dipped in melted iron, by itself (unless the sudden expansion of air in the water and all about the hand assists) it seems inadequate to explain this wonderful fact. It explains well the sudden sinking of water from 418° to 212° in Papin's digester, when the steam is let out. (Thomson, p. 195.)

† The particles of snow are separated rapidly from each other, hence there should be an *active* production of cold

made to show that the same actual amount of heat is produced, whether some metals oxidise slowly or rapidly. But I must be allowed to doubt whether these experiments are satisfactory; and I believe any person will agree that they cannot apply to the slow or rapid oxidation of iron; for to conceive by any *slow* operation as much heat is *altogether* given out as when it burns in oxygen gas seems *actually impossible*; and for the simple reason, that no man can measure exactly the very high degree of heat produced by this latter experiment. This heat, like that produced by heating vitreous selenium slowly to 192°, when it *suddenly* rises to 450° (Regnault's Cours. I. p. 245), by the cold powder of antimony in chlorine, and by potassium when laid even on ice, or when the rays of a powerful sun fall on sawdust moistened with oil, or by Sir J. Leslie's air-pump experiments, nay, even by igniting a lucifer match, &c., &c., is so great that it forces us to acknowledge the truth of the theory I have elsewhere advocated, of the generation of heat from heat, much in the same way in which life is generated from life.

It will be seen that I admit that Dr. Black's theory is true as regards the absorption of heat when ice becomes water. I shall now proceed to show that his experiments are not so satisfactory when he attempts to show that water gives out these 140° again when it becomes ice.

The following experiments (says Thomson, p. 160) prove that the heat of 140° which enter into ice to change it to water, are "not altogether destroyed." (1) "If when the thermometer is at 22°, we leave a vessel of water at 52° to the open air, and beside it another full of brine at the same temperature, with thermometers in each, we shall find that both of them gradually cool to 32°. After this the brine (which does not freeze till cooled to 4°) cools gradually to 23°, the temperature of the air; but the pure water remains at 32°, and freezes very slowly, and never gets below 32°.* Now, is it not probable that the water as it freezes gradually gives out the heat of 140° it absorbed during its liquefaction, and that this evolution maintains the temperature of the water at 32°, notwithstanding what it parts with to the air during the whole proceedings?

Now, I may observe that the reason why the water does not fall lower than 32°, seems to depend on the sudden production of a *nisus* at this temperature to *resist change of state* (for this is the *natural* freezing point), which *nisus* prevents the equilibrium of heat being established, just in the same way when a similar sudden production of force (*nisus*) prevents the water in a red-hot crucible arriving at a heat above 98.5° C. (Boutigny), or altogether to the boiling point.

This theory seems well to explain the fact that induced Thomson to think that the above experiment almost proves the evolution of 140°, viz., that the brine may be cooled to 22°. But why? Because as this does not freeze till at 4°,† the

over the 140° theory. As the force of heat is used to overcome cohesion in the two cases in the text, is it not natural to suppose that the force should be diminished or destroyed by its struggle with cohesion? To assert, as Black's 140° theory does, that one force can conquer another force without losing any of its power, is contrary to all analogy. When the cohesion of zinc is destroyed by solution in dilute sulphuric acid, heat instead of cold is produced in consequence of the *very rapid* combination of the acid and metal; hence IMMEDIATELY on the separation of homogeneous atoms, there is a CLOSER UNION of heterogeneous atoms.

* Thomson must mean till long after it is frozen; for ice at 32° may be cooled to 22°; though the operation is slow.

† The addition of salts makes freezing, as well as boiling, more difficult; and it is worthy of remark that as chloride of calcium impedes freezing more than chloride sodium (salt), so it impedes boiling more, and while with salt (30 to 100 parts) water boils at 224°, it (with a saturated solution of the former) does not boil at 284°. (Thomson, p. 178.) But as according to Deppretz's experiments, when 140-150 parts of chloride of sodium are dissolved in 1000 parts water, the freezing point of the solution is 14-450°, and with the same quantity of chloride of calcium in the same quantity of water, is at 15-062°, and with ditto of carbonate of potash, it is at 30-4880°. (Thomson, p. 156, Tables.) In this case, then, the nature of the salt seems to make a great difference, and it does not act merely mechanically by any supposed separation of the atoms of water; Sir C. Blagden's experiments on other saline solutions (p. 154) prove the same. It is curious, however, that common salt is even a little more powerful than chloride of calcium, seeing that in freezing mixtures it lowers temperature so far less.

nus in this case has no need to be developed, and is not, till the solution is cooled far beyond the temperature of the air (viz., 22° F). That "what it parts with to the air" is a pure assumption on the part of Drs. Black and Thomson, is shown by the lame way (on this occasion) in which Thomson proceeds. "If," says he, "a delicate thermometer is suspended above water while freezing, it is constantly affected by a stream of air *less cold*! (sic) than the air around." (p. 161.) Observe here a "delicate thermometer" is to be used, and *even* then air "less cold" is only given off; yet if even only $\frac{1}{4}$ of 140° had been given out, it should not only have affected a "delicate thermometer," but even the hand, as he tells us is the case "when heat is entering ice." "Place even *the hand*," says he, "under the vessel, and a current of cold air may be felt *descending* from it during the whole process of liquefaction" (p. 160), and, of course, a common thermometer also proves it. (Experiment 2.) "Let a tall beer glass, covered, and nearly full of water, with a thermometer in it, be exposed when the air is at 22° . In this case it cools down to 22° without freezing. Things being so, if the water be shaken, part of it freezes, and the temperature of the *whole* instantly rises to 32° . Now, whence come these 10° ? Is it not evident that water in the act of freezing gives out heat?" (p. 161.)

As I have found by experiment that the temperature of water is not sensibly raised by violent shaking, this evolution of heat does not arise from the "shaking" made use of, as indeed is clear from turning to p. 154, where we find "that any solid body dropt in water so cooled—whether it be a pin, a grain of salt, a piece of animal or vegetable substance, causes freezing and the rise to 32° . Agitation, or even wind, *provided all solid matter be excluded*, does not seem to act." Hence, the agitation said to produce the effect in the first quotation (p. 151), is *by implication* made to depend on the atoms of dust (solid matter) always floating in the air. And we find that Thomson "has cooled water in thermometer tubes to 8° , and once to 6° before it began to freeze, and even then it rose to 32° on freezing" (p. 154).

Now, when we consider that water may certainly be cooled to 5° (and probably even lower) without freezing, here we have at the beginning presumptive evidence that this evolution of heat and the rise to 32° is to be attributed to the *physiological* cause (if I may venture so to speak) that makes a corked and saturated solution of the carbonate or sulphate of soda crystallize, and, at the same time, evolve heat* on removing the cork, &c., &c., and that the evolution of heat is the effect to a certain extent of this cause, which in ALL cases may be called an assistant cause of freezing? Else, how is it that water has not a FIXED point down to which it may be cooled without freezing? Why sometimes to 22° , sometimes 5° , as I observe since this essay was written, as has been confirmed by others. (See Prof. Reg-

* See these experiments, Thomson p. 173. In the case of carbonate of soda 14° , and in that of sulphate of soda 24° , are given out under such circumstances. Thomson, by a similar line of argument to that used in experiment 3 (see further on) has tried to prove that these numbers represent in each case a part of the latent heat of the water of crystallization, viz., 140° ; but, if possible, less successfully, I think, than in the case of water cooled to 23° , and rising to 32° by freezing, because, even if water of crystallization be solid, as he asserts, it can only be solid from what may be called a state of chemical combination, just as oxygen united to iron, as oxide of iron, is solid. In neither of these cases is the solidity exactly the same, as in the case of ice, as the temperature at which they exist is so much higher, and I have just found that by crushing sulphate of soda between folds of blotting paper that this is wetted by the water of crystallization fixed between the pores of the salt unchanged. It is curious that the above solutions—like water brought to 22° without freezing—must be cooled and corked "without agitation," hence there is a great analogy between the cases. As these salts are very soluble, water has a strong attraction for them. Is there not then a *nus* produced in the water to prevent the salt leaving it by change of state—by crystallization? This would tend to explain the reason why the salts do not fall till the cork of the vial is removed; but when by doing this, *irritation* from particles of dust always floating in the air is produced, the crystallization takes place from the same physiological cause that makes water at 22° freeze and rise to 32° by its crystallization, so to call it.

nault's *Cours Elementaire*, Tom. 1, p. 104, 1858-9.)

The secret of cooling below 32° seems to depend on the prevention of even the SLIGHTEST degree of motion, from the contact even of the invisible particles of dust always in the air; in fact, to freedom from all irritation; hence, in the experiment first quoted, we find, as the vessel was "uncovered," the water never fell below 32° , though the brine did (the air being only 22°). By these observations I do not mean to deny that probably a great increase in the degree of cold (to -30° , or less, for example) would overcome this *anti-freezing* action of ABSOLUTE freedom from the irritation of dust, but this does not prove that freezing is always a PURELY physical act, as is supposed, for life itself can exist for a time under the action of a great degree of cold, but increase this, and life is at once extinguished and becomes impossible.

But the cautious reader will observe that in the case the water is cooled to 22° there are only 10° , and in case it is cooled to 5° there are only 27° *seemingly* given out—a very different temperature from the presumed 140° . This brings us to the famous attempt of Thomson to prove by experiment that *in reality* these 10° or 27° indicate 140° , and thus to remove the great defect in Black's theory, probably seen by him, but considered incapable of explanation. (Experiment 3.) "From many experiments," says he (p. 161), "I have found reason to conclude that the quantity of ice which forms suddenly on the agitation of water, cooled down below the freezing point, always bears a constant ratio to the coldness of the liquid before agitation. Thus, I find, when water is cooled down to 22° very nearly $\frac{1}{13}$ th of the whole freezes; when the previous temperature is 27° , about $\frac{1}{14}$ th of the whole freezes. From analogy, I conclude that for every 5 degrees of diminution of temperature below freezing without congelation, $\frac{1}{13}$ th of the liquid freezes suddenly on agitation. Therefore, if water could be cooled down 28 times 5° below 32° without congelation, the whole would congeal instantly on agitation, and the temperature of the ice would be 32° . Now, $5 \times 28 = 140^{\circ}$ gives us precisely the quantity of heat which, according to Black's experiments, enters into ice to change it to water."* Thus when water is cooled down to 22° , every particle of it wants 10° of the heat necessary to keep it liquid; (I may here by parenthesis observe that it does not, for it *still remains liquid*); 13 parts of it seize 10° each from the 14th part. These 13 acquire the temperature of 32° , and the other part being deprived of $10 \times 13 = 130^{\circ}$, which with the 10° it had lost before, make 140° (its heat of fluidity), assumes the form of ice."

Now, Professor Thomson tells us, "he was not

* In all this Thomson has omitted to comment on the main point, viz., *why*, when water is below 32° , it must always rise to 32° before it assumes the solid state of ice. This should at once have induced him to think that the giving out of these 10° had nothing to do with the supposed giving out of 140° , and formed no part of these, but depended upon the same physiological cause that makes melted tin when cooled down to 438° , or 4 degrees below its freezing (solidifying) point, rise instantly to 442° (its solidifying point), when it congeals (Thomson, p. 153, Crichton's Experiments). These 4° have nothing to do with the heat of fluidity of tin, why then should the 10° evolved when water is cooled to 22° ? It would appear that bodies may have too much cold for congealing, and that they all have a fixed temperature for such change, probably because this favours better the new arrangement of atoms, obliged to be made, when they change from fluids to solids.

Since the above was written, I see that Regnault says:—"This rise of temperature is observed in the solidification of all bodies when during fusion they are cooled below their solidifying point." This, then, will confirm my view, given at length, that the development of a *nus* during change of state is a property of matter generally. He also says (1): "A strong vibration (shock) will cause congelation of water cooled much below 32° , though the introduction of a foreign body does it more easily (*nus*)." And he seems to say (2), "that the whole of the water gradually freezes under such circumstances (Op. cit. Tom. 1, p. 104), and that it resists, and remains at 32° , till the freezing is complete. Thus, on the first of these two points, he is certainly at variance with Thomson's statement above quoted; and also, most probably as regards the latter, and if in this latter he is right, we have still stronger reason for rejecting Thomson's attempt to prove that 140° are given out when water freezes.

able to make experiments below 22° ," and hence he has been obliged to conclude "from analogy," that $\frac{1}{13}$ th part freezes for every 5° we descend below 32° . But surely "analogy" would induce us rather to think that the *lower* we descended, the proportion of $\frac{1}{13}$ th would be far more likely to increase than remain fixed, since the cold is so far greater. I may add to this objection that the very ingenious attempt to make *exactly* 140° rather overshoots the mark, for Cavendish thought 150° ,* Wilkie 130° , Laplace 136° , and Person (the latest experiments) 79.25° C., about 159° F. disappear during the melting of ice.

This theory also seems to assume another doubtful point, namely, that the 13 parts can be in actual contact with the 14th part frozen; for if not, as water is so bad a conductor of heat, they surely could not rob it of 140° . But as 13 spheres of the same size can't be all at the same time in contact with one, this 14th part losing *instantly* 140° , which it must do, for the freezing "is sudden into a spongy mass" (p. 161.), seems entirely theory. But this "spongy mass," as it nearly fills the vessel, should instead of 10° , give out 140° , or nearly so, as he himself tells us twice that the freezing in this case is very sudden. And the want of this sudden effect (in common freezing) is the reason why he, and Dr. Wilson more lately, viz., 1854 (Chemical Treatise), assert that we cannot mark by the thermometer that 140° are evolved. The formation of ice is so very slow that these 140° escape imperceptibly, say these authors; but in the present case it is not so, and I may add that as the AIR is always something below 32° , often below 22° , when water freezes, I think in all cases these 140° (or rather part of them) should escape quickly enough to be very easily observed by the thermometer, nay, even by the touch. Had freezing in general taken place when the air was *nearer* this temperature of 140° (say only 60°), then indeed as they would have been far longer in passing to it, we might conceive them lost by absorption. But air at 32° , or lower, should surely *always* be very suddenly raised by them, and in a very obvious manner, on the ground of heat seeking its equilibrium more quickly the greater the difference of the temperature of the bodies. Indeed these reflections induce me to doubt if water in common circumstances could scarcely ever be frozen except at the very surface, if it required to give out again these 140° before freezing, since the air itself would be so much heated by the very operation of freezing. The temperature of the air being 70° , I filled a vial with water heated to 168° , and found that in ten minutes the temperature of the air in a tumbler was raised to 86° , when the vial was left corked to prevent heating from steam in the tumbler uncovered. I found by placing the bulb in contact with the side of the vial, that this was raised to 103° in five minutes, and remained there; consequently glass heated to this can raise the temperature of surrounding air from 70° to 86° (the mean of two experiments with two thermometers). Air, then, has an absorbent power, as the experiments of Professor Tyndall (*Bibliothèque Universelle*) have very lately shown, and consequently the temperature of this will be raised at least 10° or 12° if 140° are really given out from water during freezing. But our quotations from Black show that it is not, and a "delicate thermometer" only proves the air above freezing water "less cold" than air around!

The attempt to prove that no part even of these 140° can be detected because the freezing is slow, may be upset again by putting water in a glass globe with a narrow neck, and applying a freezing mixture (snow and salt) to the globe. The water suddenly starts up, then subsides, and after an interval rises again slowly, then shoots into ice with the greatest velocity. (Thom. p. 20.) And the "pro-

* Phil. Trans. 1733.

+ Péclet. *Traité de la Chaleur*, Tom. I, p. 461, Sième édition. 1860.

‡ Could water freeze at 22° , even these 10° would not be given out. On obvious principles they are given out because the water is excited by an irritation to freeze or change the arrangement of its atoms, and it can only do this at 32° .

digious force generated by this expansion is shown by the experiment where it burst a brass globe an inch in diameter by freezing." (Thom. p. 34.) Reaumur found cast-iron, bismuth, and antimony also expanded on becoming solid. (p. 34.) But they probably do not expand to near the extent of ice on its formation, the expansion being so great as "10 per cent. of the volume of water."* (Phil. Magazine: June 1855.)

We may here pause, and ask the origin of this vast force in all these cases. And first, as there are probably many other cases besides the above, we may ascribe the origin of it to a general property of matter, viz., a tendency to resist a change of its natural (usual) state, and the consequent production of a *NISUS* whenever such change is forced on it. As regards water especially, we may ask, supposing all the 140° to exist in it at the time of the formation of ice, would not this vast *EXPANSIVE* effort (doubtless caused by the air being forced by being at or below 32° , to attempt to extract the heat of the water) at once *ABSORB* *CERTAINTLY*, and thus prevent any extrication of heat in freezing? Regarding, then, this expansion as another argument against the evolution of 140° by freezing, I may also regard it as showing, perhaps, an *unusually powerful nusus* in water compared with almost all other matter, seeing that this requires energy enough to expand (as it were, in very defiance of heat) while some *small portion* of heat is probably *LEAVING* it (if such heat is not converted into this pure repulsive force?); for certainly no heat is entering into it, to expand it. It would almost seem in reference to the query just put, that the *nusus* of water to resist change of state is even strong enough to subdue the very nature of heat itself (*since it expands as forcibly WITHOUT THIS, as most forms of matter can do with it*), and separate its pure repulsive element from that peculiarity in it which excites what we call pain—in fact, to decompose heat, which must be the case if "latent heat" is even indirectly the cause of the expansion.†

Since water may freeze, and never rise above 32° while the air itself remains at only 22° (as formerly stated), here again is another argument against its giving out 140° , for, if it did, the air should rise above 22° ; yet the same men who furnish us with these interesting facts, seem never to think them adverse to the 140° theory.

There is also another point they and the late writers on "Conservation of Force" overlook, viz., that when one force grapples with another force, *EVEN SUCCESSFULLY*—as when the absorption of 140° certainly is necessary to render ice fluid, or water—these 140° may still possibly, if they be not actually annihilated in the conflict of overcoming the *great cohesive power* of ice, yet be partially so, and reduced to 50° or 60° , or less. When one force in animal bodies overcomes another, we always find a diminution (though temporary, because life can regenerate force) even in the conquering force, as when a weight (for instance) is raised by nervous power. Again—when a ball in motion impinges against one at rest, much of the motion is, no doubt, transferred, but surely some must be actually *annihilated* by the act of having overcome the *resistance* of the ball previously at rest.

If 140° were given out by the freezing of water, there should be *some* elevation of the temperature in the contiguous portions of water, since this

* Moreover, the high degree of heat used for the fusion of these metals renders these cases not so analogous with the expansion of ice as might appear at first sight. The cooling of these metals, too, is also, of course, a far higher temperature than the cooling of water to form ice. In the expansion of this latter, then, we are perhaps always obliged to remember the *final cause*; for if we take cases more analogous, as oil, &c., &c., we find contraction in the *vast majority* of cases examined always to accompany congelation.

† Even the actual giving out of 10° when water at 22° freezes, seems not incompatible with the annihilation of much heat, or its conversion to *pure repulsive force*, during the *expansion* of freezing. In almost every case this causes cold, so that as Leslie produced very great heat by forcing air to condense suddenly in the void, so he produced cold enough to freeze mercury by the *sudden separation*, and of course to a *greater extent* than can happen in common circumstances of the atoms of air by rarefaction.

conducts *even high* degrees of heat slowly, as the experiment of heated water at the top of a glass tube shows. But nothing seems clearer than that there is not.

In Professor Tyndall's late experiments (Phil. Mag., Nov., 1858) after 20 minutes' action of Harrison's freezing apparatus, a thermometer, placed two inches deep in the water, was "firmly" imbedded in ice formed from this water (A) at 24° . We find this thermometer gradually *SINKING*, so that at 1 o'clock it stood at 11° , and at this time another thermometer put one inch from the side of this, and hence further from the side of the ether (which was in the middle), worked only $26\frac{1}{2}$, and was soon surrounded by ice! (B)*

But why only $26\frac{1}{2}$ if 140° had been given out by the layer of ice *firmly* frozen (A)? Perhaps against all this it may be said that the ether carried off these 140° ; if so, still surely even a *small part* should have been given out on the *side of the water*. But on the contrary we find this (B) only $26\frac{1}{2}$, though in *immediate contact* with the freezing water. In these experiments again, then, the common argument that ice freezes so *slowly* does not apply, for the water froze in twenty minutes, and hence the 140° should have been given off very quickly.

Although it seems proved that ice in melting absorbs 140° , and renders the heat "latent" (I should rather call it combined heat which loses its character, just as an alkali does when combined with an acid), still it may be asked (if not annihilated or converted to other force), do not these 140° *gradually* go out of the water as radiant heat? That the intense attraction of ice for heat *continues* after its liquefaction seems doubtful, seeing that nature is against the formation of ice, this being inimical to vitality. Hence there is probably what may be called a *latent nusus* in this ice to absorb heat, and to change to water, and this intense attraction for heat in ice would go to confirm the assertion in the last note, of its being properly considered colder than ice-cold water.

I query whether more than the mere surface (of a few inches deep) could ever freeze if 140° had to be given off, since though these 140° could be easily supposed to be given off directly into the air at the *surface* freezing, still after this was frozen, another 140° would have to ascend through this surface ice, as heat must be conducted away upwards! Such *free* heat, therefore, would immediately thaw the surface that had been frozen?

This heat *must* pass upwards, because it would be attracted by the part where the greatest cold was, viz., at the surface, which being 32° , the next would be 33° , 34° , 35° , 36° , 37° , 38° , 39° , and 40° , the greatest density of water in succession. This water at 40° would constitute a vast dense mass in all freezing water.

Add the reason above stated in favour of my opinion—that water being so bad a conductor of heat, part at least of these 140° , if disengaged, should remain a very *long time* sensible to the thermometer.

Another point in reference to the present subject is, that Sir J. Leslie, in his essay "On Heat," puts down the radiating power of water 100° ,† making it somewhat greater even than lamp-black.‡ In consequence, as soon as ever the air becomes colder than freshly melted ice, this will surely soon radiate at *least some* of the 140° it has absorbed to become water. The question is, cannot it do so, and *yet remain water*? If it can—cannot it lose *ALMOST ALL* these 140° ,

* In another Essay on Heat I shall have occasion to say more on these experiments; at present I may state that they in one sense seem to support M. Person's opinion quoted by Prof. Forbes, that "ice is essentially colder than ice-cold water," (Compt. Rend., 1850) since they show that the interior of masses of ice was often below 32° . But we know that ice water never can, in common circumstances, get below 32° , and if in Thomson's experiments "ones to 5," we know that ice *might* be cooled to any possible degree and yet remain ice.

† See also Thomson, On Heat, p. 25.

‡ This great radiating power will also support my opinion (above-stated), viz., that if 140° are given out by freezing, at the very least 10° or 12° should be indicated by a thermometer placed in the air above the water becoming ice.

and still remain water? That when at 212° it can lose 140° and yet remain water at 72° is certain. Ditto that when at 172° it can lose *even more* than 140° , and *yet remain water*; since, as already stated, Professor Thomson was able to prevent the formation of ice even when water was cooled to 5° .

(To be continued.)

ON THE RELATIVE EFFECTS OF DENSE AND SUPER-HEATED STEAM.

By Mr. THOMAS HOWARD.

IN my communication to the MECHANICS' MAGAZINE of 14th February, 1857 (No. 1749) on the subject of super-heating steam, I ventured to remark that "it would seem probable that the system may shortly pass into the competing hands of the makers of steam-engines, without which condition there would be little hope for it even now." It has just arrived at this position, and would seem on the fair road of becoming generally adopted. The exposition too therein given of the loss of steam, and of course of fuel, by the precipitation of water on the internal surface of the cylinder and its adjuncts on the admission of dense steam, such surface being cooled by the rapid conversion into vapour of this water on communication with the condenser, and so on alternately, is beginning to be accepted and understood; as is also the prevention of this loss by simply giving to the steam "a sufficient surcharge of caloric to enable it to maintain its elastic or vaporous condition throughout the stroke without the deposit of water."

I now record in further confirmation of these views the result of many experiments made in the interim on the four steam-engines at these works. Two of them are fitted with jackets to which the steam is admitted from the boilers at its full pressure, and the condensed water drawn off as it accumulates. One of them, without a jacket, is provided with a vessel to catch the condensed water passing along the steam-pipe, which is of considerable length. The other has neither a separator nor jacket, but the steam-pipe is thoroughly clothed. The boilers are large and have plenty of steam room, and being worked by the spare heat of the reverberatory furnaces, are not subject to forcing or priming. The nominal powers of the engines are 45, 25, and two of 20 horses. I inserted into the cylinder cover a small cup or thimble projecting a little way into the cylinder, and containing sufficient mercury to cover a thermometer bulb. A hole was also drilled nearly through the valve case close to the port, also supplied with a little mercury.

The engines are low pressure and condensing, the pressure varying from four to nine pounds per inch above the atmosphere. Care was taken to have the piston packing and slides duly tight at the time of the experiments. A pressure indicator of the usual construction was applied simultaneously with the thermometer.

The result of the experiments is, that when the engines were working about one-fourth below their assigned velocity under heavy loads, and the throttle valves wide open in order that very little difference of pressure should exist between that in the cylinder and steam-pipe, the temperature of the former at the least was 17° below that of the latter. And when the engines were worked at their assigned velocity of 200 feet speed of piston per minute, the difference of temperature reached 20° . The steam is not worked *expansively* more than by the ordinary lap of the slides, as there is an abundant supply, and this may be nearly balanced by the cushion of steam at the end of the stroke. The diminution of temperature as shown by the above discrepancy, owing to a

* If these 140° are ever given out again this is the only possible way, and very different from what Dr. Black, Thomson, and Wilson supposed, for it is obvious that on this theory these 140° will not be necessary for fluidity, though they are for the *melting of ice* certainly. Supposing only 10° remained to be given out in the act of congelation, our thermometer possibly might not be able to detect them. When air is at 22° , it certainly must be *long gradually* extracting heat from water.

diminution of density of steam in the cylinder (here by the indicator nearly two pounds per inch), from rapidity of motion of piston, or it might be by partial closing of the throttle valve in other cases, must not, should these experiments be repeated, be confounded with that otherwise arising, or a greatly exaggerated result will be apparent; in short, by so much as is due to the rarefaction, as I found on trial. The experiments were conducted with the hot cistern at about 100°, and a vacuum of nearly 28 inches when the barometer was at 30 inches. The thermometer was much influenced by the state of the condenser vacuum varied occasionally for the purpose. The water in the hot cistern was sometimes permitted to become so hot as nearly to stop the motion of the engine when the cylinder thermometer rose to nearly the normal temperature of the steam; but on restoring the injection it presently fell to its former point.

Now, the steam pressure in the average of the experiments was six pounds per inch, the temperature due to which is 227°, and the temperature of the interior of the cylinder was at the highest 17° less, falling to 210° on the mean; and as dense steam cannot exist for an instant in contact with a surface at a temperature lower than is due to its pressure without a corresponding deposition of water and loss of heat of conversion, it will be found on consulting tables of steam pressure, that the above denotes a loss of between one-third and one-fourth.

It then occurred to me that this might be further tested by stopping the engine at the dead point, and then admitting by a momentary opening of the induction valve, a cylinder full of steam at a certain pressure, and noting the effect on the indicator; and I found when this was aptly done the fall closely followed the thermometric deduction. Some loss must here take effect unperceived however. But tried on smaller parts of the stroke when the plenum can be more rapidly produced and cut off, the decadence was almost immediate and in accordance to the full with the thermometric result. On the whole, I cannot estimate this loss by deposition (in the cylinder) at less than one-fourth of the steam.

With respect to the loss by radiation on the naked cylinders, as shown by the subsequent decline of the thermometer, it certainly did not amount to a thirtieth part of the former loss measured by the comparatively tardy declination.

At first sight it might appear very improbable that so considerable a deposit of water can occur in the cylinder as is due to a loss of one-fourth of the steam that enters it at every stroke from the boiler, but a little calculation will show that in a cylinder of a hundred horses nominal power, as an example, the interior surface, including the top and bottom, the piston and rod, the slides, ports, &c., alternately acting, will demand for such effect a film of water of only one-sixth-hundredth of an inch in thickness, if the average steam pressure be one atmosphere, and about one-three-hundredth if of two or say nearly twenty pounds per inch on the safety valve, allowing for some expansive action, &c.—a common pressure for modern marine engines. And at the existing temperature under nearly a vacuum the evaporation of such film will be abundantly rapid.

And now I must state that I could not discover in the jacketed cylinders any material mitigation. Presuming this inertness of the jacket to be due to its comparatively slow conduction compared with the rapidity of stroke under the small differential temperature of about 20°, I found such fully confirmed by experiments on iron plates of the thickness of the cylinder. As the heat will be transmitted in a geometrical ratio under more favourable conditions, as in the Cornish expansion engine, for instance, the result may then be more marked. The piston and rod, the valves, ports, &c., within, and generally the top and bottom of the cylinders remain, however, little affected. Further, the jacket but ameliorates the loss at the expense of the boiler; it might enable a certain size of cylinder to do more work, but a corresponding saving of fuel may not follow.

It is, I think, worth inquiry as to whether Watt was cognizant of this veiled loss of steam by deposition. I cannot find that he was. On the contrary he makes it the essence of his patent for separate condensation that the cylinder is thus maintained at the heat of the steam acting within it. This is further promoted by cutting off external radiation by jackets, &c. But the end designed was certainly not attained, notwithstanding the vast improvement over the old method. Neither do his annotators seem aware of it. Nor does Tredgold, in his standard work on the steam engine, allude to it. The invention and use of the pressure indicator probably led Watt and his compeers away from the necessity of applying a thermometric one. And indeed the latter on an instant acting principle is yet a desideratum, for the mercurial thermometer is of too slow a character to present us with other than an average indication. It may be that its range would mark greater differences. It should here be noted that I always found the mercury in the drilled hole near the port several degrees below the other.

We will now proceed to the subject of superheating the steam. It is remarkable that its resuscitation is chiefly due to what I believe to be an entirely erroneous idea respecting it, viz., that the great portion of the effect derivable from it is the result (under Mr. Wetherell's patent) of mixing it with dense steam. I do not hesitate to express my conviction that no gain of power whatever is thus obtained over that of the super-heated steam alone, and that the experiments related of some trial engines in America and France have led to unsound deductions. There may be a convenience, however, in sometimes adding a little of the dense steam in order to reduce the temperature of the surcharged steam if carried so high as to carbonize the packing, if not metallic, and the lubricating material.

We have noted how a loss of fully one-fourth of the steam arises when at a density due to its temperature. Now, when a surcharge of caloric is given to such steam, a considerable reduction of temperature may occur without deposition of water; in fact such steam is in the condition, to a certain point, of a permanent gas, and will pass off into the condenser, or in high pressure engines into the atmosphere, with very little cooling effect on the cylinder, and without the ill consequences related. Yet it will ultimately condense with fully the same rapidity as dense steam, and with better result, since the surface of the cylinder being dry will not be giving forth steam from deposited water, and by so much too will the injection, air-pump, &c., be relieved. But there is a further saving derived from super-heating steam, namely, the increase of volume obtained by means of a portion of the heat otherwise lost in the uptake or funnel. If 100° of surcharge be added to dense steam say of two atmospheres pressure (15 pounds on safety valve), we have 250° + 100 = 350°, and if 20° of this is abated in the cylinder then 330°, a moderate temperature and below carbonization remains. The added 80° will now increase the working volume as 80° to 460°, equal about one-sixth, and thus the practical saving is brought up to quite one-third of the fuel. Probably some mischief has been done to the adoption of super-heated steam by the non-comprehension of what good effect a limited surcharge produces, and extravagant expectations from high and damaging temperatures.

But before the entire advantage will be derived from the super-heating of steam, the expansive action in marine engines especially should be made the rule and not as now the exception, either (to bring up the full power) by enlarging the diameter of the cylinder or increasing the pressure in the boilers, or a combination of both; and surely it is now time that taking the power of engines by the diameter of the cylinder only should at least be modified, so as not to stand in the way of such improvements, and permit a large extent of expansion without the need of a corresponding increase of pressure. Some engineers seem to think there must be much saving in steam of high, over low, or moderate pressure; I really

doubt if there be any advantage save that of causing a fixed size of cylinder to do more duty than otherwise. Now if a certain assigned rate of expansion be determined, and the boilers be under regular firing calculated to supply and super-heat the needed steam, and only such variations be occasionally had recourse to on either side of such rate, in conformity, in marine engines, with the requisition of the vessel, as under sail or adverse wind, the super-heating would be equable, and its full advantages, under expansive action, made available.

I doubt not that with such arrangements, and the more so if aided by a system of condensation returning nearly the same water to the boilers, they might be boldly reduced one half, fire grate, funnels, and other appurtenances following; and a saving of quite half the consumption of fuel, and the labour and charges incident thereto, might without difficulty be attained.

It has happened singularly enough that almost the first marine engines to which the system of superheating has on its revival been applied, and the first of the General Steam Navigation Company's fleet, are those now in one of their vessels (of about 110 horses nominal power), which were worked with superheated steam in accordance with my design more than twenty years ago, and so far as relates to it with perfect success. The surcharging was achieved as at present, though under a different arrangement, by the spare heat of the fuel after vaporising the water, which was applied to a surface of about two square feet per nominal horse-power (the actual power is greater in these days and requires more surface, accordingly it may be three to four feet), and the temperature of the steam was 350°. The pressure was 10 pounds per inch, four pounds being at that time the customary pressure, worked expansively by three adjusting cams actuating the throttle valve, fitted for the purpose, and the assigned admission was rather under half the stroke. These engines were removed from the Columbus paddle wheel barque intended to make the first steam passage to America, and which was the third vessel, the Government steamer Comet having been the first and the Vesta private vessel the second, in which the superheating was used (besides an experimental engine of 10 horses power constructed at these works), in conjunction with my process of local vaporisation and of condensation by the re-injection of the same water. The superheating, the expansive action and the circulating condensers were perfectly successful in all these instances. Unforeseen difficulties, however, prevented the accomplishment of the method of vaporisation, and adverse concurrent events, among others the successful voyage of the Great Western and the introduction into navigation of tubular boilers, led to the relinquishment of the enterprise. The saving of fuel was one-half and upwards, and I am convinced may again be reached by the means I have before-mentioned.

King and Queen Iron Works, Rotherhithe.
December, 1859.

A NEW ARTIFICIAL LIGHT.—An improved form of the lime light originally experimented upon by Captain Drummond, some years since, was shown by Sir Charles Bright in the Exchange News-room, Liverpool, on Saturday last. No substantial improvement has been made in artificial lighting since the introduction of gas at the commencement of the present century; and steadiness, continuity, and diffusiveness of the new light, as well as its enormous power, were fully shown. A single jet of the improved lime light is estimated as equivalent to 40 Argand, or 80 fishtail burners, each consuming five cubic feet per hour, or to 400 wax candles of four to the pound, and its power, unassisted by a reflector, was stated to be 40 times greater than the present oil lamp; and for coast lights, under the same circumstances, should the light be as economical and capable of as easy manipulation as it was on this occasion, there can be no doubt it will effect a considerable change in lighting of crowded places, where the present system of extracting the oxygen requisite for respiration from the air is so objectionable.—*Times*.

MURRAY'S PATENT IMPROVED CHAIN PUMPS.

Fig. 1.

Fig. 2.

FIG. 3.

MR. MIDDLETON, engineer, of Loman-street, Southwark, is manufacturing an improved chain pump (patented by Mr. Murray), which has been employed and given great satisfaction at the sewer at Whitehall-place and at other places under the Metropolitan Board of Works, in the Royal Arsenal, Woolwich, for various well-sinking purposes, and for numerous other contract works. These pumps, which in some cases have double chains, can be made to lift any quantity and to any height. The chains are of great strength and durability, the links being steeled, as are also the bearings of the chain pulley spindle, so that whatever grit or sand may be washed up, it will not have any effect on the working parts. They are suitable for contractors' use in the formation of docks, tunnels, coffer-dams, sewage works, &c., or for the drainage of marshes, lakes, &c., in the reclaiming of land or for irrigation, and in the

Colonies, where steam power might not be accessible, they can be driven by cattle. Two of these pumps have been employed by Messrs. Baker and Son at the Extension Works of the Grand Surrey Docks; one of them has been at work day and night for the last nine months, and the other since June last. A Murray's pump of this size, viz., 27 in. x 9 in., will lift 2,100 gallons per minute, or 126,000 gallons per hour, or equal to 8 pumps of 15-inch diameter and 2 feet stroke, if making 20 strokes per minute; that is, supposing the 15-inch pumps are all doing their full amount of duty, which scarcely ever happens in practice, as the smallest defect in a valve, or bucket, or any impurity in the water, keeping the valves off their seats, causes very considerable loss—frequently more than one-half. Murray's pump, on the contrary, will always do duty in proportion to the speed at which it is driven, and which can be

varied to a much greater extent than the common pump, without running the risk of breakage or derangement.

Figs. 1 and 2 of the annexed engravings represent vertical sections of a single chain Murray Pump. Fig. 3 is a plan or horizontal section of the same to a scale of $\frac{1}{4}$ inch to the foot. A is the barrel; B the head of pump; C the chain; D¹ one of the lifts ascending; D² one of the lifts descending; D³ one of the lifts folding round; E the bottom roller; F the chain pulley keyed on; G the pump spindle and running in; H H the two carriages or bearings, on the outer end of which the spindle is keyed; I the rigger, which by means of a strap is driven from another rigger on the engine-shaft. It will be seen that the parts are few and simple, and as no clacks, valves, or packing are required it is almost impossible for the pump to choke up or get out of order. The pump never requires charging to obtain a vacuum, for after the first turn of the chain a vacuum is formed under the lift.

PROFESSOR THOMSON'S CENTRIFUGAL PUMP.

ON A CENTRIFUGAL PUMP WITH EXTERIOR WHIRLPOOL, CONSTRUCTED FOR DRAINING LAND:

Read by PROFESSOR JAMES THOMSON, of Belfast, before the Institution of Engineers in Scotland.

THE centrifugal pump which forms the subject of the present communication has been designed and constructed in the course of this year for Messrs James Ewing & Co. of Glasgow, for the drainage of lands belonging to them in Demerara.

The cultivated district of Demerara in which the lands referred to are situated, forms a narrow strip or belt of low ground extending along the sea-coast. It is about four or five miles wide, as measured from the sea back towards the interior. It lies generally below the level of high tide; and is protected in front against the waters of the sea and in rear against the waters of the Savannah, or inland swamps, by embankments. The district was originally embanked and reclaimed by the Dutch, and was taken from them by the English in 1796, along with other parts of what now forms British Guiana. The drainage is ordinarily effected by valves or kokers, as they are designated, which discharge to the sea when the tide is low, but hinder the entrance of the tidal water when it rises. Of late years banks of soft and shifting mud, or slob, have been gathering and increasing for great distances out to sea, for miles perhaps, in front of some of the estates. These banks, by stopping the drainage outlets to the sea, have caused several estates to be swamped, and have been threatening like destruction to others. Some estates, it is understood, have been saved, mainly by the employment of centrifugal pumps, driven by steam power, which keep up the drainage when the slob rises so high as to stop the ordinary flow to the sea by gravitation through the valves or kokers; and which, by keeping up a run of water over the slob, tend, as is believed, in a material degree to keep open the outlet channels through the slob, or to open them again when choked up by the shifting of the mud banks. Some of the estates of Messrs. James Ewing & Co., after having been seriously threatened for several years by the approach of mud banks to their front, were last year partially injured by deficient drainage; and thus the proprietors were led to determine on speedily procuring a centrifugal pump, to be driven by a steam-engine already existing on their land, as the driving power for one of their sugar mills. They engaged the writer to prepare the designs according to an improved arrangement, which had been devised by him for increasing the work done by a given power, the main feature of which is the employment of an exterior whirlpool round the circumference of the pump wheel. The exterior whirlpool had been previously introduced in a centrifugal pump designed by him in 1853, for Messrs. James Ewing & Co., for drainage of lands on an estate of theirs in Jamaica, and constructed by Messrs. W. & A.

PROFESSOR THOMSON'S CENTRIFUGAL PUMP.

FIG. 1.

FIG. 2.

M'Onie and Co., of Glasgow. It had also more recently been introduced in a centrifugal pump constructed according to his designs by Messrs. Robert Napier & Sons for a steamer for the Great West of Scotland Fishery Company.* The nature of this modification in centrifugal pumps, consisting of the introduction of the exterior whirlpool, may be understood from the following explanations:—

In centrifugal pumps for water, or fans for air, when doing actual work in lifting the fluid, or in forcing it against a pressure, the fluid has necessarily a considerable tangential velocity on leaving the circumference of the wheel. This velocity in wheels in which the vanes or blades are straight or radial, is the same as that of the circumference of the wheel; in others, in which the vanes are curved backwards in receding from the centre, it is somewhat less; but in all cases it is so great that the water on leaving the wheel carries away, in its energy of motion, a large and important part of the work applied to the wheel by the steam-engine or other prime mover. This energy of motion in centrifugal pumps and fans, as ordinarily constructed, is mainly consumed in friction and eddies in the discharge pipe, which receives the water or air directly from the circumference of the wheel. The object of the introduction of the exterior whirlpool is to prevent this waste, and to apply usefully, towards increasing the pumping power, the energy of the motion inherent in the fluid on its leaving the circumference of the wheel. For this purpose there is

provided, round the circumference of the wheel, an exterior chamber, in which the fluid is left free to revolve, in virtue of the motion it had on leaving the wheel. This chamber may be called the exterior whirlpool chamber, and its diameter is ordinarily made about double that of the wheel. The fluid revolving in it assumes the condition of a vortex or whirlpool, which has been designated by the writer as the vortex or whirlpool of free mobility. The principles of the motion of this kind of whirlpool, and of its application in improving the action of centrifugal pumps and blowing fans, was first brought forward at the Belfast meeting of the British Association in 1852, in a paper read in the mechanical section, of which an abstract is to be found in the report of the meeting. The chief properties for which this whirlpool is remarkable are, that its particles move with velocities inversely proportional to their distances from the centre or axis of rotation, and that each particle composing it is free to move to any position within the whirlpool, without interfering with the general motion of the other particles, as each one in moving towards or from the centre assumes of itself, subject simply to the laws of motion under a central force, the velocity due to its position in the whirlpool. It is also a property of this whirlpool that, for any equal particles, in whatever situations in it they may momentarily be, the sum of the energies corresponding to velocity, to pressure, and to height is constant. Thus it arises that, in the exterior whirlpool in the pump for raising water, as each particle of water in moving from the centre, gives up its velocity according to the law of motion

already stated, it either actually ascends or becomes subject to a pressure capable of causing it to ascend through a height corresponding to the energy deducted from its motion. It follows, therefore, that through the medium of the exterior whirlpool a decided increase in the working efficiency of centrifugal pumps is attainable; the work contained in the rapid motion of the water leaving the wheel, which, in centrifugal pumps as ordinarily constructed is wasted, being, according to the new arrangement, usefully employed in increasing the pumping power of the machine.

To arrive by a simpler method than that just given at a general idea of the mode of action of the exterior whirlpool in improving the efficiency of the centrifugal pump, it is only necessary to consider that the mass of water revolving in the whirlpool chamber, round the circumference of the wheel, must necessarily exert a centrifugal force, and that this centrifugal force may readily be supposed to add itself to the outward force generated within the wheel; or, in other words, to go to increase the pumping power of the wheel. The outward force generated within the wheel is to be understood as being produced entirely by the medium of centrifugal force if the vanes of the wheel be straight and radial; but if they be curved, as is more commonly the case, the outward force is partly produced through the medium of centrifugal force, and partly applied by the vanes to the water as a radial component of the oblique pressure, which, in consequence of their obliquity to the radius, they apply to the water as it moves outwards along them. On this subject it is well to observe that while the quantity of water made to pass through a given pump with curved vanes is perfectly variable at pleasure, the smaller the quantity becomes the more nearly will the force generated within the wheel for impelling the water outwards become purely centrifugal force, and the more nearly will the pump become what the name ordinarily given to it would seem to indicate—a purely centrifugal pump. When, however, a centrifugal pump with vanes curved backwards in such forms as are ordinarily used in well-constructed examples of the machine, is driven at a speed considerably above that requisite merely to overcome the pressure of the water, and cause lifting or propulsion to commence, the radial component of the force applied to the water by the vanes will become considerable, and the water leaving the circumference of the wheel will have

* See *Transactions of the Institution of Engineers in Scotland*, vol. I., p. 90.

a velocity less than that of the circumference of the wheel in a degree having some real importance in practice. It has, indeed, been promulgated in respect to some centrifugal pumps with curved vanes brought into use in the last six or eight years that they are capable of propelling the water from the centre to the circumference along the line of a stationary radius, and discharging the water at the circumference without rotatory velocity. This supposition need only be mentioned as being fallacious. A motion approximately along a stationary radius may no doubt have been attained when the pump was made to impel a fluid against no resistance; but when a pump is actually doing work in raising water, the rotatory motion of the water on leaving the circumference of the wheel is unavoidable. In practice it involves in ordinary pumps an important loss, the loss being commonly about as much as the entire power usefully applied in overcoming the gravitation of the water; and the efficiency of the pump comes out, therefore, when friction and other farther losses are taken into account, in ordinary circumstances, considerably less than fifty per cent. of the applied power.

From calculations relative to the various sources of loss occurring in centrifugal pumps of the improved kind with the exterior whirlpool, according to the design carried out for Messrs. James Ewing and Co., the writer thinks the efficiency of such pumps may be fairly estimated at about seventy per cent. Now, the steam-engine, already existing on the estate for which the pump forming the special subject of the present paper was required, is estimated as being capable of applying 25 horse power (of 33,000 foot-pounds per minute) to the driving of the pump. The lift of the water is intended to be variable, according to the state of the weather, and is to range ordinarily from 2½ feet to 5 feet. Then for a 2½ feet lift, and an assumed efficiency of the pump of seventy per cent., the quantity of water lifted comes to be 3,700 cubic feet per minute. And for a lift of 5 feet the quantity would be about half as much, or say 1,850 cubic feet per minute.

The details of the constructive arrangements of the centrifugal pump are shown in Fig. 1. prepared from drawings supplied to the Institution by Messrs. W. & A. M'Onie & Co., the engineers by whom the execution of the work has been carried out. In reference to them the writer here wishes to recognise the very efficient aid they afforded him during the progress of the work in arranging many of the practical details of the construction. The work was required to be designed and executed in great haste, and their ready co-operation tended very materially to facilitate the business of the undertaking. Fig. 1, is an elevation, and Fig. 2 is a (reduced) plan of the pump—one-half of each figure being in section—Fig. 1 as through the line *a b* in Fig. 2, and Fig. 2 as through the line *c d* in Fig. 1. In addition to the description already given of the principles and mode of action of pumps of this kind, attention may be directed to the helical outlet chamber *B C*, which is arranged for receiving the water from all parts of the circumference of the whirlpool chamber, except the part from which an immediate outlet into the discharge pipe is available. This helical chamber has a gradually increasing area to meet the regular accessions of water which it receives from its commencement at its smaller extremity, *B*, forward to its termination at *C* in the outlet pipe. This helical outlet chamber is arranged with a large part of its capacity lying nearer to the axis of rotation than the edge of the whirlpool chamber cover, *D*. This arrangement is made with the special object in view of preventing eddying water that will exist in the outlet pipe at times when the pump is raising a small quantity of water through a high lift, from being able to return to the circumference of the whirlpool, with the risk of breaking through the water of the whirlpool, and, as it were, falling in towards the centre in consequence of having less rotatory motion, and, therefore, less centrifugal force than the water of the whirlpool. If any such return water were to penetrate into the whirlpool, it

would very materially damage the action of the whirlpool, by disturbing its motion and introducing impacts of quickly moving against slowly moving water. The helical chamber, as may readily be seen by consideration of the figures, is adapted for receiving any such eddying water, and hindering it from getting access to the whirlpool; as the most rapidly moving water coming direct from the whirlpool will tend always to fly outwards, and will occupy the outer parts of the helical chamber, leaving the inner parts of the same chamber for the dead or eddying water, when from any of the varying circumstances of the height of lift and power applied such eddying or dead water exists.

The writer would farther direct attention to the peculiar adaptation of the forms selected for the various parts of the case for the attainment of a high degree of stiffness for preventing the top and bottom of the case from changing their distance apart under varying circumstances of the internal water pressure. It is to be observed, on this point, that no tie bolts through the case for holding the top and bottom, together are admissible, as any such tie bolts would interrupt the revolving motion of the water. Yet at the same time, there ought to be as close a fit as possible, without rubbing, between the joint rings of the wheel and case at the central orifices, in order to prevent leakage and waste of the water pumped. The conical forms of the bottom, *E*, and top, *D*, of the whirlpool chamber, and the cylindrical vertical walls, *G*, with the somewhat conical form of the roof, *H*, of the helical chamber, all taken together, and, in conjunction with riveted boiler-plate as the material, form a shell of peculiar stiffness. The chief difficulty connected with this undertaking has had reference to the transmission by sea and land of so bulky a thing as the boiler-plate casing, which is 16 feet in diameter, and which could not well be sent in parts, to be put together at the site where the pump is to work. The casing, was, of course, sent separate from the boat, *K*, or large conduit for leading to the water the lower central orifice, *L*, and the casing was shipped on deck, being too large to enter the hold of the vessel by which it was transmitted. Accounts have been received of the safe landing in the colony of these bulky parts; and news is soon expected of farther progress having been made towards their erection at the site where they are intended to operate.

It may be mentioned that the pivot, *M*, on which the wheel, *A*, turns, is made of lignumvite. It is fixed standing upright in the bottom of the boat, *K*; and in the bottom of the shaft, *Q*, there is fixed a brass socket, *P*, which turns on the pivot. Arrangements are made for spreading an ample supply of water over the rubbing surfaces of the wood and brass, for lubrication. Bearings of lignumvite have of late years been found to be much superior in durability, when working under water, to any kinds of metallic pivots. Lignumvite, from this reason, has recently come much into use for the bearings of propeller shafts, where the shafts pass through the sterns of steamers. Lignumvite pivots have likewise come much into use for turbines in America, and the writer is now in the habit of introducing them in his vortex turbines, in preference to all other kinds of pivots.

In conclusion, the writer considers centrifugal pumps, constructed on the principles which have been described, to be capable of affording the best available means of raising large quantities of water through low lifts, or through lifts of such moderate height as may not require the wheel to revolve at an inconveniently high speed. For drainage of fens, and for raising the sewerage of towns through moderate lifts, they are peculiarly suitable. They are much less liable than common pumps to be choked or injured by the entrance of solid materials; and, having no working valves or pistons, they are remarkably free from injury by wearing; whilst, as regards economy of power in the applications referred to, they will, the writer believes, be found decidedly superior to pumps of the ordinary kinds, constructed with valves and pistons or plungers.

Mr. M'Onie exhibited a model of the pump, and explained the drawings, showing the details of its construction. In reply to inquiries, he stated that the pump was prevented by a timber framing from being shifted by the floating action of the water in which it was immersed. The wheel, *A*, was upon a vertical shaft, and the water had access to it both above and below, finding its way to the top central aperture over the casing of the helical discharge duct, and to the bottom central aperture by the boat, *K*, which formed a channel for it through the mud. The wheel was made with 36 blades, which were about 6 inches apart at the circumference, and 1½ inches at the central opening; the whole being flush-riveted together, in order that the frictional resistance to the passage of the water should be as little as possible. The pump was intended to work at the rate of about 30 revolutions per minute, but the speed would vary with the lift.

The President thought that a pump of this kind would be very suitable for removing the sewerage of towns where, from the lowness of situation, it was necessary to lift the sewerage in order to get rid of it.

Mr. Hill, of Barlanerck, who was introduced by the President, said he had had much pleasure in listening to the President's address, and to Professor Thomson's paper. He thought that in places like Glasgow, where one part of the town was much more elevated than another, the sewerage of the higher part might, by its descent to a mean level, be made to raise to that level the sewerage of the lower part. Professor Thomson's pump would be extremely well adapted for working out this plan.

The President remarked that the number and closeness of the blades in the wheel might seem likely to cause more friction than was desirable; but he believed that Professor Thomson had carefully calculated the amount of friction, and that he had proportioned each part, so as to obtain from the whole a maximum result. This particular form of pump was suitable for low lifts, and in the present instance the pump had been designed for a lift of from 2½ to 5 feet only. For higher lifts the size would have to be reduced, and the velocity increased, for the application of the same power. He proposed that the thanks of the meeting be awarded to Professor Thomson for his paper, and to Mr. M'Onie for his drawings and model.

The thanks of the meeting were unanimously awarded accordingly.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

We have much pleasure in directing the attention of the young engineers of London and its neighbourhood to the above-named institution. It came into existence in May of the present year, and has already attained for itself a respectable standing among older and kindred societies. Its members are composed, for the most part, of students of engineering—in its civil and mechanical branches—who meet once in each month for mutual edification. After the manner of the Society of Arts, &c., papers are read and discussed on these occasions, the subjects of them being confined to matters scientific. The individual experiences of the workshop and of the drawing office are thus afforded room for expansion, and made the medium of general instruction. The rules of the society have been framed with much care, whilst the yearly subscription appears to have been fixed at as moderate a sum as is consistent with the liquidation of current expenses.

It is impossible that anything but good can result from the establishment of the "Civil and Mechanical Engineers' Society." It will, we venture to predict, become a Preparatory, or Training School rather, whence eventually pupils will emerge worthy of following in the footsteps of those great men whose works are every where around us, and who have done so much to make this country pre-eminent in the scale of nations.

The Secretary's address is 26 Arbour-square, Stepney.

Proceedings of Societies.

INSTITUTION OF CIVIL ENGINEERS.

Dec. 13, 1859. — Joseph Locke, Esq., M.P., President, in the chair.

Annual General Meeting.—The report of the Council for the past session, which was read, noticed briefly, in accordance with the usual practice, some of the works in progress, or which had been completed during the preceding twelve months. These we may notice in our next number.

The principal papers read during the session were then noticed, and it was remarked that, though comparatively few in number, they were, in excellence and in variety of subjects treated, quite equal to those of former years. This was evident from the interesting and animated discussions to which they gave rise, occupying about one-half of the entire number of meetings. The members were again urged to make the institution the depository of copies of any public or private reports upon which they might have been engaged, so as to be at hand for reference. The council had pleasure in announcing that Mr. George Robert Stephenson had expressed the intention of presenting the portrait, by Briggs, of the late Mr. George Stephenson; that Messrs. Isambard and Henry Brunel had kindly offered a portrait, by Horsley, of their late lamented father; and that Mr. Joseph Cubitt had promised the portrait, by Boxall, of Sir William Cubitt, Past President. It was hoped that these valuable additions to the collection already upon the walls in the meeting room would induce further contributions, so that the series might be rendered complete. The deceases of the members during the year were announced to have been:—the Earl De Grey, Honorary Member; Messrs. Isambard Kingdom Brunel, Hugh Ebrington Fortescue, William Harfree, Daniel Mackain, Robert Stephenson, M.P., Thomas Storey, and Alexander Wright, Members; James Barrett, Samuel Bennett, Robert Cantwell, George Donaldson, Robert Barlow Gardiner, Edward Highton, John Houldsworth, Edward Hughes, and George Mills, Associates. The resignations of one member and three associates were announced, and it was stated that the effective increase during the year (after deducting the deceases and resignations) amounted to thirty-seven, whilst the total number of members of all classes on the books was eight hundred and ninety-four. It was felt that the loss of two such men as I. K. Brunel and Robert Stephenson could not be adequately estimated. Both had been prematurely removed in the prime of life, and in the vigour of their intellect—the former, on the eve of the completion of one of his gigantic and original conceptions, after successfully combatting great difficulties in the execution of many peculiar constructions—and the other, when it might have been hoped that the practical experience of many years, in the prosecution of great and successful works, would have been rendered useful to his country, in the House of Commons, and as an adviser of the Government, for which he was eminently qualified, not only by his knowledge, but by the uprightness of his character. Among other munificent legacies to public bodies, Mr. Robert Stephenson had bequeathed to the Institution of Civil Engineers the sum of £2,000. It would be for the succeeding council to propose the mode of appropriating the interest of this fund, in such a manner as to connect the name of Stephenson permanently with the Institution. The financial position of the Institution continued to be very satisfactory. There was an available balance of £1,356 (of which £1,000 was on deposit at interest,) being an excess of £300 above the balance of the previous year. The series of Minutes of Proceedings up to, and including the volume for 1857-8, had been completed, by the publication of Vol. VIII., Part 2, and of Vol. XVII. It was stated that the Minutes for the past session would be issued early in 1860. The Council, in resigning their trust, thanked the members for the support accorded to them on all

occasions; and asked for their successors the same kind co-operation they had experienced—without which the Institution could not continue to make the progress that had, up to the present time, marked its career.

After the reading of the report, Telford Medals were presented to Messrs. M. Scott, R. Mallett, H. Bessemer, and W. J. Kingsbury; a Watt Medal to Mr. J. W. Jameson; Council Premiums of Books to Messrs. T. S. Isaac and M. B. Jackson; and the Manby Premium, in Books, to Mr. W. J. Kingsbury.

The thanks of the Institution were unanimously voted to the president for his attention to the duties of his office; to the vice-presidents and other members and associates of council, for their co-operation with the president, and their constant attendance at the meetings; to Mr. C. Manby, secretary, and to Mr. James Forest, assistant secretary, for the manner in which they had performed the duties of their offices; as also to the auditors of the accounts and the scrutineers of the ballot, for their services.

The following gentlemen were elected to fill the several offices on the council for the ensuing year: G. P. Bidder, president; J. Fowler, C. H. Gregory, J. Hawkshaw, and J. R. McClean, vice-presidents; Sir William Armstrong, J. Cubitt, J. E. Errington, T. E. Harrison, T. Hawksley, G. W. Hemans, J. Murray, J. S. Russell, G. R. Stephenson, and J. Whitworth, members; and W. Bird and Captain Huish, associates.

The meeting was then adjourned until Tuesday, January 10th, 1860, when the new president would take the chair, and it was announced that the monthly ballot for members would take place, and the discussion upon Mr. Grantham's Paper, "On Arterial Drainage and Outfalls," would be resumed.

THE SOCIETY OF ARTS.

Dec. 14, 1859.—R. Wygram Crawford, Esq., M.P., in the chair. The Secretary called attention to Mr. Ludlow's life-boat (described in a recent number of the MECHANICS' MAGAZINE), and several members were elected. The paper read was on "THE GREAT EASTERN," by William Hawes, Esq. We have brought forward much of this paper in a leading article in another page. We condense the following remarks from other parts of the paper:—To carry out his leading ideas, Mr. Brunel adopted the following dimensions and arrangements as most likely to accomplish the results he desired, viz.:—The length of 680 feet; the length of upper deck, 692 feet; breadth of beam, 83 feet; depth, 53 feet; engines of 2,600 horse nominal power; a midship section of 1,600 square feet, with a capacity of carrying 12,000 tons of coals, a large number of passengers, and 10,000 tons of cargo. The centre of the ship above the main-deck he appropriated to passengers, the space below the water-line to the boilers, engines, and coal bunkers. This space is 350 feet in length, and is divided into three compartments by two substantial bulk-heads running fore and aft the entire depth of the ship. The centre compartment, 86 feet in width, is exclusively occupied by the engines and boilers. The outer compartments are filled with coals. The boiler-rooms are arched over with an iron roof, to prevent the radiation of heat from them into the ship, and also to prevent the escape of smoke, and other unpleasant smells into the cabins above them. This complete isolation of the boiler department from the rest of the ship is quite novel, and is a great security to the passengers against injury from any accident which may happen to them. The remaining 382 feet of the ship is about equally divided fore and aft, and is appropriated to cargo and stores. So much for the basement of the ship. The space immediately above the 350 feet we have thus described is divided into two parts by the paddle engine room, which occupies, including the engineers' and the stokers' berths, a space of 40 feet in length and the entire breadth of the ship, thus separating the first from the second and third class passen-

gers; the first being in the forward compartment and therefore subject to less inconvenience from smoke or dust, as also from any vibratory motion arising from the working of the screw. With this exception there is no real difference, so far as the ship is concerned, in the accommodation of the third, second, and first class passengers. Of course, the fittings of the cabins, the number of berths in them, and the dietary, would be different in the first, second, and third classes. Although almost up to this time every large ship has been looked upon with doubt as to its strength and safety, it is now admitted by all that, whatever may be its other faults, this ship is the strongest ship ever built. In all ships previously built size was the great element of weakness. To the Great Eastern it was a source of strength, for only in a very large ship could all the elements of strength she possesses be combined. The first and most important addition of strength is gained by the cellular construction of the hull and deck. In fact it is a double ship to 3 feet above the water-line, held together by ribs of immense strength, at intervals of 6 feet each, which are united to transverse plates, dividing the entire surface of the ship into spaces of 6 feet square. The next element of strength we find in the two longitudinal bulk-heads, the entire depth of the ship, firmly fastened to the transverse bulk-heads, and thus forming two bars of iron 60 feet high, 250 feet long, and $\frac{1}{2}$ inch thick. The force required to tear these asunder, as well as to rend the double cellular hull, is more easily imagined than described, and is certainly very far beyond any strain which, under known conditions of ocean navigation, can possibly arise. The strength obtained by this arrangement was tested during the launch, when unexpectedly, and for the long period of two months, the ship was supported on two cradles, each 120 feet in length, leaving above 150 feet at each end, and about 100 feet in the centre of the ship without support, and the most careful observation could not detect the slightest change of form. So much for its length. Next, as to its breadth. The cellular construction of the hull is also a source of strength against a transverse strain, but this is more particularly provided for by the cellular upper-deck, and by the twelve transverse bulk-heads, each forming a plate or bar of iron 58 feet deep, 80 feet long, and half-an-inch thick. These transverse bulk-heads, stiffened by their fastenings to those running longitudinally, and the cellular construction of the hull and deck of the ship, give to the whole a uniform strength which has never before been attained. The strength of the general structure, and its power to resist a transverse strain, was tested in an unexpected manner by the accident which happened during her voyage to Portland. Here was the explosion of a boiler at very high pressure, 30 feet long, and 6 feet in diameter, the force of which lifted the entire chimney, weighing 8 to 10 tons, many feet high, carrying away and overcoming the resistance of all its fastenings, without doing the least injury to the frame of the ship; and it is equally remarkable that the heavy funnel being lifted from the bottom of the ship to several feet above the deck, should fall upon it, and cause but the most trifling damage, so that not only was the general structure or hull tested by the resistance it offered to the lateral force of the explosion, but the strength of the deck was tried in a manner never calculated upon, and both bore these tests to the admiration of every one who has since examined the ship, but especially of those on board, none of whom could, without such experience, have believed it to be possible that a ship exposed to such an explosion could afterwards have carried them, without a moment's delay, safely to their journey's end. These, then, are the peculiarities of construction, which have given to this large ship such strength and safety as not only to forbid the idea of increased danger from its great size, but to convey to the mind a sense of security greater than can be afforded by any ordinary mode of shipbuilding, and, from the practical engineering improvements

over any other large ship yet built. Next let us consider the motive power. Here, taking advantage of experience—appreciating the advantages of the paddle, which are great, and those of the screw, which are equally so, both having drawbacks under special circumstances, and each also possessing advantages calculated to overcome the deficiencies of the other—Mr. Brunel determined to apply both, giving the preponderating power to the screw, and singular it was that the advantages of this combination should have been exhibited while the ship was riding at anchor at Holyhead, during the late storm, when the screw, fouled by floating timber, was freed by the gentle action of the paddle, and injury to the paddle floats prevented by stopping the paddle engines and propelling the ship by the screw, thus alternately using first one and then the other, the safety of both being secured by the alternate action and rest of each. It is perhaps fortunate that in so short a time the ship should have undergone three unexpected tests of her efficiency—of her longitudinal strength in the launch, of her lateral strength by the explosion, and of the utility and safety arising from the double motive power at Holyhead, in each case the success being complete. The steadiness of the ship at sea may be, to some extent, attributed to this double motive power, each shortening the interval which would elapse when, by the natural action of the waves, the other would be inefficient. In pitching, if she will ever meet a sea to make her pitch in the ordinary sense of the term, the paddle will be in full action, and so propel the ship when the screw has least power, and in rolling, when the paddles are least effective, the screw will be most efficient. I have not time to notice many minor points of great interest to the engineer and shipbuilder. The absence of external keel—the flatness of her floor—her iron and wooden masts—the application of steam power to aid in many of the ordinary duties of the ship—the situation and adjustment of her compasses, &c., I cannot do more than thus briefly refer to, passing on to the inquiry as to the effect of her great size on the facility and certainty with which she can be navigated. The first difficulty suggested was that of steering. To accomplish this efficiently, it is necessary that the captain should be in a position to command a full view of the ship's course, and to communicate at once with the officer at the helm. The post always assumed by the captain in steamers is the bridge near the centre of the ship; but in this ship it is more than 300 feet from the helm, and, without some mechanical aid, it would be impossible to ensure that immediate obedience to his orders which is indispensable. This aid is afforded by two dials, properly marked, and two indicators, one moved by the man on the bridge close to the captain, awaiting his orders, and the other answering thereto from the helm. The captain directs the man on the bridge to put the helm "hard a-port," and he immediately brings the indicator before him to the proper mark on the dial, moving, at the same time, a corresponding finger on the dial immediately before the officer at the helm. As soon as the finger begins to move, the officer orders the men under him to move the tiller in the same direction, and this action moves the dial on the bridge, showing that the order is in course of being obeyed, almost before it is fully expressed. By this contrivance the orders of the captain are conveyed 350 feet to the officer of the helm, and are obeyed quickly, quietly, and accurately, thus overcoming the inconvenience of distance, and obviating one of the anticipated difficulties of navigating this large ship. At night these dials are illuminated, so that the facility of communication is fully equal to that by day. On either side of this steering apparatus [which is the invention of Mr. Lungley, shipbuilder, of Deptford-green] are the paddle and screw engine telegraphs. Here, by turning a handle with an indicator, working on a marked dial-plate, a similar indicator is moved in the engine-room, every movement being preceded by the sound of a large bell, which can be distinctly heard over the noise of the machinery, and by these arrangements the rudder and engines,

although out of sight of the captain, are as immediately under his command as though he could speak to the engineers and helmsman. [The beautiful engine-room telegraphs of the Great Eastern were made and fitted by Mr. Suffield, of Bermondsey-wall.] I am not sailor enough to describe the arrangements for working the sails and rigging, but it is easy to conceive that, with an officer and gang of men to each mast, orders may be conveyed by signal with certainty and precision, and the experience gained at sea, so far, is favourable to the practical efficiency of these arrangements, for the ship invariably answered the helm as certainly and as quickly as any small craft. The next, but perhaps the most important subject for consideration, as regards the safe navigation of the ship, was how to secure, as far as possible, the accuracy of the compass in so large an iron ship, but experience and science have overcome all difficulties, for although the weight of iron in this ship is by several thousand tons greater than that in any other, yet it is so large that the effect of the iron of the ship on the compass of the ship can be as easily, and perhaps more easily counteracted, than in ships of war, or in smaller ships where the compass is more closely surrounded by the iron-work and the armament. Ample means have been taken, by careful adjustment, and in the selection of the positions where the compasses are placed, to prevent if possible any disturbance of the magnetic action, and, if any should occur, to afford facilities for watching and noting such disturbance, so as to prevent any deviation from the intended course. Every one who has been on board during her trial trips testifies to her steadiness. It has been assumed by some, without any reason, that she would neither pitch nor roll, an assumption displaying a want of knowledge of dynamics, and of what is required for the safety of the ship. The waves which would make a Dover packet pitch and roll, as most of us have experienced in crossing the Channel, will produce no effect upon her. Let, however, waves be formed which bear the same proportion to this ship as the waves in the Channel do to a Dover packet, and the pitching and rolling will be equal; but as this, so far as our knowledge goes, cannot be, so will this ship be easier than any other. Thus we find, during the late rough weather, as she came round the Land's End, with a westerly gale driving in the Atlantic rollers, she rolled only to eight degrees, whereas Dr. Scoresby, running round the same course to Plymouth in the Royal Charter, states that off the Lizard the rolling varied from 20 to 30 degrees, and that in a gale of wind in the Southern Ocean, when the ship was running fourteen knots, she rolled 28 degrees to port, and 19 degrees to starboard; and that her rolling on the return voyage from Australia via Cape Horn was much greater, the clinometer indicating, on several occasions, an inclination of 33 degrees to port and 28 degrees to starboard, and on one occasion the time occupied by each oscillation was fifty seconds. It can hardly be doubted, then, that with almost an absence of pitching, and rolling so much reduced as in bad weather not to exceed eight to ten degrees, this must be a comfortable ship, and we have a right to regard the superiority of comfort in this over that of any other ship as satisfactorily proved.

Appendix.—Dimensions of the Great Eastern.

Length over all, 692 feet; breadth, 83 feet; depth from deck to keel, 60 feet; number of watertight compartments, 12; partial ditto, 7; longitudinal bulkheads, running fore and aft, from keel to upper deck, at a distance apart of 36 feet, and 350 feet long, 2; space between the two skins of ship, 2 feet 10 inches; thickness of floor plates or keel, 1 inch; thickness of inner and outer skins and bulkheads, $\frac{1}{2}$ inch. Engines. Paddle:—4 cylinders, 74 inches diameter, 14 feet stroke, 4 boilers, 40 furnaces, 1,000 horse-power, paddle-wheels 50 feet in diameter, but capable of reduction by reefing. Screw:—Cylinders, 4; diameter, 80 inches; stroke, 4 feet; boilers, 6; furnaces, 72; diameter of screw, 24 feet; blades to screw, 4; horse-power, 1,600. Weight of ship and ma-

chinery at launch, 12,000 tons, immersing 15 feet 6 inches; ordinary light draught, 20 feet; full load, 30 feet; space for fuel, &c., 12,000 tons.

GEOLOGICAL SOCIETY OF LONDON.

Dec. 14, 1859.—Prof. J. Phillips, President, in the chair. J. H. Bass, Esq., was elected a Fellow. The following communications were read:—1. "On some Remains of *Polyptychodon* from Dorking." By Prof. Owen, F.R.S., F.G.S. 2. "On some Fossils from near Bahia, South America." By S. Allport, Esq. Communicated by Prof. Morris, F.G.S. 3. "On a Terrestrial Mollusc, a Chilognathous Myriapod, and some new species of Reptiles, from the Coal-formation of Nova Scotia." By J. W. Dawson, LL.D., F.G.S., &c. 4. "On the Occurrence of Footsteps of *Chirotherium* in the Upper Keuper of Warwickshire." By the Rev. P. B. Brodie, F.G.S.

PHILOSOPHICAL SOCIETY OF GLASGOW.

Anderson's University Buildings, Nov. 2, 1859. The Fifty-eighth Session of the Philosophical Society was opened this evening, Dr. Thomas Anderson, Professor of Chemistry in the University of Glasgow, President of the Society, in the chair. The President, in opening the Session, remarked, that the society had now reached the fifty-eighth year of its existence, and that during the whole of that period it had gradually advanced, both in the number of its members and the importance of its proceedings; and that it now possessed a library of considerable extent, well stocked with scientific periodicals, and calculated to be of much value to its members. He pointed out the great importance of such a society in a city like Glasgow, at a time when the arts and the sciences on which they are founded are every day coming more closely into contact. It is only necessary to watch the progress of the useful arts to feel convinced on this point; for we find that in all those which are most closely related to science a watchful care is exercised to discover and apply every discovery that is likely to prove useful. On the other hand, instances are constantly offering themselves in which, from the neglect of science, particular arts have fallen far behind our knowledge of the theoretical principles on which they depend; and in others, it has required the active interference of scientific men to bring about the practical application of many principles which they have determined. Mr. Edmund Hunt exhibited and explained the "Cinephantic Colour Top," with which he reproduced some of Mr. Rose's effects, and showed a number of new colour experiments. Mr. Hunt was requested by the society to continue his experiments at next meeting.

Nov. 16, 1859.—The President in the chair. Several gentlemen were elected members of the society. Mr. Cockey, the treasurer, gave in an abstract of his account. Dr. Bryce, the Librarian, reported that the library now consisted of 2,930 volumes, exclusive of the English, French, and German Periodicals. The society appointed the following gentlemen to be its office-bearers for session 1859-60:—

President, Professor Thomas Anderson, M.D.; Vice-Presidents, Professor W. J. Macquorn Rankine, LL.D., Mr. Alexander Harvey; Librarian, James Bryce, LL.D.; Treasurer, Mr. William Cockey; Joint-Secretaries, Mr. Alexander Hastie, Mr. William Keddle; Council, Mr. J. P. Fraser, Mr. George Anderson, Mr. John Condie, Mr. James Couper, Professor Wm. Thomson, Mr. Walter Crum, Mr. Robert Blackie, Mr. George Smith, Dr. Francis H. Thomson, Mr. Edmund Hunt, Mr. James B. Napier, Professor Rogers.

Professor William Thomson submitted to the society a proposal which had this evening been deliberately considered and recommended by the council, that the proceedings of the society should be printed and issued fortnightly, instead of annually, or at longer intervals, as heretofore.

On the CINEPHANTIC COLOUR TOP. By Mr. Edmund Hunt. Mr. Hunt again exhibited the

Cinephantic* Colour Top, and gave a highly entertaining explanation and description of the experiments, which, we regret to say, we have not space for.

Nov. 30.—Mr. Alex. Harvey, Vice-President, in the chair. G. Blair, M.A., was elected a member of the society.

Professor William Thomson reported that the committee appointed at last meeting to prepare a plan for the fortnightly publication of the proceedings had agreed to a set of regulations, which the society unanimously approved, and then in accordance with them authorised the committee to proceed with the fortnightly publications of the proceedings. The society agreed to take charge of the reports of the commissioners of Patent Inventions, and to make them accessible to the public, on condition of the entire expense being borne by the Town Council.

Mr. David Mackinlay read an account of A VISIT TO ICELAND. In this paper the writer gave an account of a fortnight's journey he had made from Reykjavik, the capital, to the south coast of Iceland, interspersed with many interesting observations on the condition of the country and the habits of the people. On his way Mr. Mackinlay visited Thingvall and the Geysers; and on his return, the hot springs of Reykum and the sulphur mines of Krisuvik.

MEETINGS FOR THE ENSUING WEEK.

WED.—London Inst., "On the Physical History, Structure, and Materials of the Earth," by E. W. Bradley, Esq., F.R.S., F.C.S., at 7 p.m.

FRI.—London Inst., "On Certain Principles of Vegetable and Animal Chemistry," by F. A. Malone, Esq., F.C.S., at 7 p.m.

RAILWAY BREAKS.

SOME experiments were made last week on the Oxford, Worcester, and Wolverhampton Railway, between Worcester and Evesham, with Newall's, Gasse's, and two other breaks, by Mr. Fay and Mr. Chambers. The experiments were made in presence of Colonel Jolland, the Government Inspector, Mr. Fenton, Chairman of the Oxford, Worcester, and Wolverhampton Railway Company, Mr. Sheriff, the general manager, and Mr. Wilson, the Engineer. There were also representatives present from the Great Western and the Lancashire and Yorkshire Railway Companies. The results of the experiments are said by the *Times* to have been as follows:—On six experiments with Fay's break, at an average speed of 36 miles an hour, the experimental train was stopped, on an average, at a distance of 507 yards. In a second series of experiments with the same break, at the same average speed, the train was stopped on an average at a distance of 795 yards from the place where the break was first applied. Two series of experiments were tried with Mr. Chambers's break. On the first series of six runs, at an average speed of 36 miles an hour, the train was stopped at an average distance of 731 yards; and on the second series, at an average speed of 35 miles an hour, the stoppage was effected at 717 yards. There was some derangement of the break machinery in the first series of experiments with Chambers's break; the experiments with Newall's break were first at an average speed of 36 miles an hour, at which speed the train was stopped on an average at a distance of 900 yards. On the second series, at a speed of 34 miles an hour, the train was stopped at 591 yards on the average. There were some differences in the gradients, which were not given. M. Gasse's break was only tested on the second day by one series of six runs. The average speed attained was 31 miles an hour, and the average distance run before the train was stopped after the first application of the break was 920 yards. In these experiments the efficacy seemed to lie between Fay's break, which stopped a train (taking averages) running at 36 miles an hour in 507 yards, and Newall's, which stopped a

train running at 31 miles an hour in 501 yards. The difficulty of stopping the trains was greater on the last day's trials, owing, probably, to the state of the weather and the rails.

STEAM-SHIP ECONOMY.

TO THE EDITORS OF THE "MECHANICS' MAGAZINE."

Woolwich Dockyard, 19th December, 1889.

GENTLEMEN,—As Mr. Cheverton's letter appears to me to be a repetition of his former inquiry as to the theoretical construction of the formula $\frac{V^3 D}{\text{Ind. h. p.}} = C$, and a further critique on the fallacious views which he himself entertains as to what he still erroneously supposes to be the application of the formula by myself and others who have adopted this formula, on which subjects I have already responded by letters which appeared in the *MECHANICS' MAGAZINE* for 18th November (No. 47) and 9th December (No. 50), I have nothing further to say on those subjects in a theoretical point of view, but I am still in hopes that an example of the practical application of the formula $\frac{V^3 D}{\text{Ind. h. p.}} = C$, as compared with the results consequent on Mr. Cheverton's formula $\frac{V^3 D}{\text{Ind. h. p.}} = C^1$, may lead to a better understanding on the matter of determining, by some rule based on the actual performance of ships, the merits of steam-ships in a dynamic point of view, instead of leaving this important consideration a mere matter of opinionative caprice, not based on any fact of performance with reference to the mutual relation of displacement, speed, power, and coal.

By way of illustration, therefore, let us endeavour to deduce from the known performance of the Banshee what may be expected to be the power that will be required to propel the Great Eastern, with a mean displacement of 18,000 tons as on the late passage from Holyhead to Portsmouth, at the speed of 15 knots per hour.

The Banshee, as is well known, with a displacement of 800 tons, attained the speed of 16 knots per hour, the engines of 350-horse power nominal working up to 1,600 indicated horse-power, which is equivalent to 15 knots with 1,316 indicated horse-power, this performance producing by the formula $\frac{V^3 D}{\text{Ind. h. p.}} = C$, or $\frac{15^3 \times 800}{1316}$, a co-efficient $C = 221$, which co-efficient applied to the Great Eastern by the formula $\frac{V^3 D}{\text{Ind. h. p.} (x)} = C$, with a view to determining the indicated horse-power (x) from which 15 knots per hour may be expected, gives $\frac{15^3 \times 18000}{x} = 221$, or $x = 10144$, being the indicated horse-power by which the Great Eastern may be expected to attain the speed of 15 knots per hour, assuming her to be equal to the Banshee in point of dynamic merit.

Now, let us see the result consequent on the adoption of Mr. Cheverton's formula $\frac{V^3 D}{\text{Ind. h. p.}} = C^1$. In this case for Banshee we shall have $\frac{15^3 \times 800}{1316} = C^1 = 2048$, which co-efficient applied to the Great Eastern by Mr. Cheverton's formula $\frac{V^3 D}{\text{Ind. h. p.} (x)} = C^1$, with a view to determining the ind. horse-power (x) from which 15 knots an hour may be expected gives $\frac{15^3 \times 18000}{x} = 2048$, or $x = \frac{15^3 \times 18000}{2048} = 29670$.

Thus it appears that by the ordinary formula which I have adopted as the base of my calculations on steam-ship capability, the Great Eastern (assuming her type of hull and engine efficiency to be equal to that of Banshee) may be expected to attain 15 knots per hour with her engines of 2,600 nominal horse-power working up to 10,444 indicated horse-power, but by Mr. Cheverton's proposed formula it will require 29,670 indicated

horse-power to attain the speed of 15 knots per hour. Surely, the Great Eastern has refuted this conclusion.

By the sophistry of some adulators of the Great Eastern, the public have been led to expect a speed of 20 knots and upwards per hour, and the public are disappointed because it is not realised. Others insist that, as compared with other ships, the capabilities of the Great Eastern ought to be

judged of by the formula $\frac{V^3 D}{P} = C^1$, and not by the formula $\frac{V^3 D}{P} = C$. The foregoing calculations show what that friendly lift will end in. There never was an enterprise to which the proverb "Save me from my friends" can be applied with greater force than in the present case of the Great Eastern.

I am, Gentlemen, yours very obediently,
CHAS. ATHERTON.

NOTICES.

The *MECHANICS' MAGAZINE* will be sent free by post to all subscribers of £1 ls. 8d., annually, payable in advance. Post Office Orders to be made payable to K. A. Broome, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements to ensure insertion. Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

THE *MECHANICS' MAGAZINE* AND PATENT OFFICE, 166 Fleet Street, London, will be closed on Monday next in consequence of the Christmas celebration which is to be generally held on that day. Patents in progress will, of course, be duly attended to notwithstanding the closing of the office.

THE APPEAL.

We have to acknowledge the receipt of a £5-note from some liberal friend—who is content to be known to ourselves and others as "Iota"—for the benefit of the unfortunate lady on whose behalf we lately appealed. For this generous Christmas gift the lady in question desires us to express her grateful thanks to her unknown benefactor.

Our Weekly Gossip.

We observe with much satisfaction that Mr. W. H. Russell, LL.D., late special correspondent of the *Times*, is about to edit a new periodical entitled the *Army and Navy Gazette*, and *Journal of the Militia and Volunteer Forces*. We believe the establishment of this paper under Mr. Russell's management will do more than any other single event to make the volunteer force efficient and permanent in this country. His little volume on *Rifle Clubs and Volunteer Corps*, published some few months ago, is by far the most practical book that has appeared on the subject, and shows that the author is one of the few who thoroughly comprehend the risks to which the volunteer movement is exposed, and the means which alone can make it useful and lasting. We may be quite sure that he will not neglect this division of the new journal, and there is good reason to hope that volunteer corps will find in it precisely that guidance and stimulus which would be found indispensable to their continuance.

At the last monthly meeting of the Royal National Life-Boat Institution, a vote of thanks, inscribed on vellum, was unanimously awarded to Mr. C. Clifford, "in acknowledgement of his able and indefatigable exertions in the cause of humanity, in inventing and bringing to a state of perfection an improved plan for safely lowering boats at sea, which is now being brought into general use, and through the instrumentality of which a large number of lives have already been saved from drowning."

A few weeks since we had an opportunity of inspecting, at the works of Messrs. Brown, Lenox, and Co., Millwall, an admirable fire-engine constructed by Mr. William Roberts of that establishment, and fitted with his patent fire-engine pumps. We had the satisfaction of finding, not only that the engine was a very powerful and excellent one, but also that Mr. Roberts had organised a fire-brigade from among the workmen, and had already done good service.

* The term Cinephantic is used to distinguish Mr. H.'s modification from Mr. Gorham's Kaleidoscope Top, and from other colour tops; and signifies "producing apparent motions," or "producing optical phenomena by motion."

than one fire, and that before the established fire-brigades had time to reach the fires. During last week Messrs. Brown, Lenox, and Co.'s brigade again did excellent service at the fire which occurred on the premises of Messrs. J. and E. Wright, rope manufacturers, Millwall. The erections in question are about 1,300 feet in length, but the fire was fortunately confined to the large tarring and winding house, adjoining the hemp stores and warehouse. The proprietors state that the fire was completely subdued by the untiring endeavours of Mr. William Roberts and companions of the "True Blue Brigade," who attended with the powerful engine of Messrs. Brown, Lenox, and Co., constructed upon Mr. Roberts's patent principle. "To him especially," say they, "our thanks are due for his praiseworthy effort in obtaining a supply of water from a neighbouring stream, and thus preserving the main body of the premises from entire destruction." The establishment of the True Blue Brigade reflects great credit upon the proprietors of the engine, and upon Mr. Roberts, who conducts the operations of the brigade with so much courage and success. Their example might be followed with immense advantage.

We understand (says the *Athenaeum*) that the contributions to the scientific relief fund, organised by the Royal Society, already exceed £3,000, and that the amount has been invested in the public securities in such a manner as to form a separate account from that of the Society's other funded property. With her usual liberality, and desire to make her great wealth useful, Miss Coutts has subscribed £100 to this excellent fund.

The same journal states that a decennial prize of a gold medal and 6,000 francs, commencing from the year 1860, has been founded by a family of the name of Dolfus, at Malhausen, to be awarded to the best essay during the preceding ten years, "on the industrial progress of the Upper Rhine district," or to the discoverer of the most useful invention.

Mr. Chadwick, silk manufacturer, of Mosley-street, Manchester, writes as follows:—

GENTLEMEN,—The continued high price of silk affects so seriously the interest of all engaged in the manufacture, that any improvement in the production is deserving of notice. It is generally known that the imperfect character of the raw silk of China and other countries—its coarseness, unevenness, and foulness—does not arise from defects in the cocoon itself, but solely from the rude machinery employed, and the careless method adopted in reeling it. To remedy this evil, it occurred to me, as a manufacturer, that by importing the cocoons themselves, we could adopt machinery to wind and throw (or partly throw it) direct upon bobbins, and thus not only effect a saving in waste and in the cost of production, but obtain a thread of *any size required*—even and clean. This being an original invention, a patent for the 'process' was taken out on the 14th April, 1853, under the title of 'Improvements in the production of raw and thrown silk.' In this patent another name was associated with mine, for the purpose of having the invention carried into practical operation—my own engagements preventing me giving it the necessary attention. Having more recently, with the aid of my mechanic, Arthur Elliott, and of Mr. Wm. Robertson, mechanic, invented a form of machine which performs the process with perfect accuracy and success, and is so simple in its character that it may be applied either in the silk-producing countries or at home, I beg now to introduce it to the notice of the trade. For this purpose I have had a machine of 80 spindles set up in a central situation in London, where it may be seen at work any day between the hours of eleven and three o'clock, on application to Messrs. Leckie and Co., silk brokers, Winchester House, Old Broad-street.

JOHN CHADWICK.

Dr. McCormack, in the following note, revives a suggestion which has often been made but never attended to:—

3 Wellington place, Belfast, 17th Dec. 1859.

In respect of the destruction of the Royal Charter and other vessels on a lee-shore, an available means of safety has struck me very forcibly, as possible in many if not in all these disastrous cases. To be lost on a lee-shore implies that the wind blows from the sea to the shore. Now, what would seem easier than to construct an extempore kite, by means of a couple of sticks, arranged like the letter X, and to stretch upon these sticks a napkin, a silk handkerchief, or a fragment of sail? What boys term a bellyband is then to be attached, a tail also to steady the light machine, and a cord, and it is complete. An hour elapsed from the time the Royal Charter struck till she parted in two; but during that hour, extempore kites might have secured safe and certain communi-

cations, one or more, with the shore, and the lives of hundreds, for the interval was but a stone's throw, might have been saved.

HENRY MCCORMACK, M.D.

The following sketch of some of the features of New York appears in a letter from the *Times* correspondent:—"I think that New York stands pre-eminent among the principal commercial cities of the world for maladministration of public affairs. It has an unequalled water front upon two superb rivers, with a tide of only six feet; and yet it is without a dock worthy of the name. Its commerce is carried on over miserable wooden piers, rotting and crumbling away by the weight of the goods put upon them, or its shipping lies exposed in the stream. The island upon which it is situated is narrow, with a crowning ridge in the centre running longitudinally with it. The distance on either side to the river is not much more than from Temple-bar to Charing-cross. One would think that bad sewerage and dirty streets ought to be unknown, and yet it would be difficult to find a large town more marked for either. Water as well as other means of cleanliness abound, yet the odour of the parts of the town occupied by tenement houses is unequalled and overpowering. The town lies on a mass of rock, which comes to the surface almost everywhere, and, oftener than otherwise, has to be removed by blasting to give cellars to the houses. Nothing makes a harder or better pavement than this rock, and yet nearly all the town is paved with rough cobble-stones. But these shortcomings are confined to one side of the account. On the other side the show of municipal taxation does great credit to the wealth of the city. The tax and assessments amount to about 2 per cent. of the gross valuation. Fancy such a measure of taxation upon an estate yielding 5 per cent. per annum."

Patents for Inventions.

ABRIDGED SPECIFICATIONS OF PATENTS.

THE abridged Specifications of Patents given below are classified, according to the subjects to which the respective inventions refer, in the following table. By the system of classification adopted, the numerical and chronological order of the specifications is preserved, and combined with all the advantages of a division into classes. It should be understood that these abridgements are prepared exclusively for this Magazine from official copies supplied by the Government, and are therefore the property of the proprietors of this Magazine. Other papers are hereby warned not to produce them without acknowledgment:—

STEAM ENGINES, &c., 1166.
BOILERS AND THEIR FURNACES, &c., 1165, 1168, 1171.
ROADS AND VEHICLES, including railway plant and carriages, saddlery and harness, &c. *None*.
SHIPS AND BOATS, including their fittings, 1142.
CULTIVATION OF THE SOIL, including agricultural and horticultural implements and machines, 1148.
FOOD AND BEVERAGES, including apparatus for preparing food for men and animals, 1145.
FIBROUS FABRICS, including machinery for treating fibres, pulp, paper, &c., 1147, 1157, 1163, 1172, 1180.
BUILDINGS AND BUILDING MATERIALS, including sewers, drain-pipes, brick and tile machines, &c. *None*.
LIGHTING, HEATING, AND VENTILATING, 1142, 1162, 1170, 1177.
FURNITURE AND APPAREL, including household utensils, time-keepers, jewellery, musical instruments, &c., 1144, 1169.
METALS, including apparatus for their manufacture, 1150, 1151, 1154, 1176.
CHEMISTRY AND PHOTOGRAPHY, 1156.
ELECTRICAL APPARATUS, 1152.
WARFARE, 1161, 1167, 1173, 1175.
LETTER PRESS PRINTING, &c. *None*.
MISCELLANEOUS, 1141, 1143, 1146, 1149, 1153, 1155, 1159, 1160, 1164, 1174, 1178, 1179, 1181, 1182.

1141. J. DIXON, jun. "Improvements in machinery or apparatus for staining paper." Dated May 6, 1859.

In any convenient position of the ordinary paper-staining machine the inventor places a small box or vessel containing colouring matter, and fixes over it a small hammer or lever having its fulcrum so that one end will be heavier than the other, and by wheels and pinions he causes the said hammer to dip into the colouring box and fall on the paper as it passes through the machine, say at every twelve yards, thus making a mark at the proper place where it can easily be cut into pieces without the trouble of measuring. *Patent abandoned*.

1142. T. JONES. "An improved apparatus and arrangement of flues for heating and ventilating buildings, ships, and other structures, and for causing draughts in chimneys." Dated May 6, 1859.

The patentee uses an apparatus or chamber at the back or sides of the usual fire-places, and an arrangement of flues leading to and from the said apparatus, and also from the lower floors to the fire-places in

those above, the air in all cases passing into the chimneys and thus causing proper draught. The apparatus at, say, the back of the usual fire-place consists of two principal parts, made of fire-clay, and forms a chamber or cavity in which air may be heated for distributing and warming apartments; its peculiar construction, (analogous to the syphon), gives a forward motion to the air led to it, thus allowing either cold or heated air to be distributed. *Patent completed*.

1143. W. S. BOOTH. "A new or improved washing machine." Dated May 6, 1859.

This consists of an oblong or other shaped tube or vessel, the bottom of which is concave, and a moveable rubber, the bottom of which is convex, the curves both of the bottom of the tub or vessel and the moveable rubber being struck from the centre or axis upon which the moveable rubber turns, the opposed surfaces of the bottom of the tub or vessel and rubber being provided with ribs or flutes, by which the articles to be washed are rubbed by the motion of the moveable rubber. *Patent completed*.

1144. J. FREARSON. "New or improved fastenings for wearing apparel, and for such other purposes as the same are or may be applicable to." Dated May 6, 1859.

The objects of this invention are, 1, to effect the junction of parts of dress or other articles by a neater and less bulky fastening than the ordinary hook and eye. 2. To prevent or diminish injury to the fastening by pressure, as in ironing or mangling. 3. To effect a more secure fastening when the parts fastened are slack than is effected by the ordinary hook and eye. The nature of the invention is not described apart from the drawings. *Patent completed*.

1145. G. T. BOUSFIELD. "Improvements in apparatus for grinding grain and other substances." (A communication.) Dated May 6, 1859.

This is applicable where two horizontal grinding stones placed one above the other are used, and consists in suspending each stone on apparatus similar to gimbals, so that it is free to incline in any direction. *Patent completed*.

1146. J. COMBE. "An improved plantforme or apparatus for measuring the hoofs of horses for the purpose of forming their shoes." Dated May 7, 1859.

This consists of two blades of metal with handles fixed together by a central pin, on which they work like forceps or scissors; the blades are curved outwards. On each side of each blade and near to its outer edge, flanges of metal are fixed extending from the central pin a sufficient distance along the blades to clip the hoof beyond the flanges; the blades are graduated on both sides. The flanges are so curved that one is adapted to the outer side of the hoof, and the corresponding one on the other blade to the inner side; those for the outer sides of the hoofs are on the same blade, and those for the inner sides on the other blade; one side of the instrument is adapted for the right foot and the opposite end for the left. A graduated quadrant is fixed to one of the handles, and passes through a slot in the other. A binding screw in the last-mentioned handle acting on the quadrant retains the blades and handles in any position required. *Patent abandoned*.

1147. J. BRAY and J. W. HARRISON. "Improvements in machinery or apparatus for spinning fibrous materials." Dated May 7, 1859.

Instead of the ordinary contact drum and friction pulley for changing the motion of self-acting mules, the inventors place a broken wheel on the cam-shaft, which works into the ordinary packing-off wheel, and gives the necessary change motion without causing the usual noise and shock, thereby effecting a great saving in band straps, wheels, &c., and by being able to give the said wheel a much slower motion than has been done by the ordinary method, they avoid the breaking of the rings on the escape plate. *Patent abandoned*.

1148. A. C. BALLETT. "Improvements in reaping machines, part of which improvements is applicable to other agricultural implements." Dated May 7, 1859.

The specification of this invention comprises many features in connection with agricultural implements, and is too elaborate to be quoted here at sufficient length for an intelligible abstract. *Patent completed*.

1149. M. HENRY. "Improvements in the manufacture and construction of locks and fastenings." (A communication.) Dated May 7, 1859.

Here locks and fastenings are manufactured for room-doors and other purposes, so that the thickness usual to such articles may be reduced, as also the depth of mortice required for their reception. *Patent completed*.

1150. R. MUSHET. "Improvements in puddling iron and steel." Dated May 7, 1859.

This consists in the use and application in the pud-

dling steel and iron of ores of titanium and titaniferous iron ores previously deoxidised for improving the quality of steel or iron obtained by puddling pig iron, or any mixtures of these, into steel or malleable iron, whether the said compounds or mixtures containing titanium be used in conjunction with or without oxide of manganese. *Patent completed.*

1151. R. MURPHY. "Improvements in the manufacture of iron." Dated May 7, 1859.

This consists in adding titanium ore, titanio acid, titaniferous iron ores, or deoxidised titaniferous iron ores to pig iron, cast iron, or refined iron, whether melted in a blast furnace or re-melted in a cupola furnace, refining furnace, or other melting furnace, so that titanium may be reduced and alloyed with the pig iron or refined iron. *Patent completed.*

1152. C. FROST. "Improvements in the construction of electric telegraph cables." Dated May 7, 1859.

Here the telegraphic conductor or conductors are first coated with gutta-percha or other insulating material as heretofore, and then surrounded with rings of metal, which are slipped over the conductor or conductors while open, and then closed thereon by suitable nipping instruments. Between the metal rings are introduced rings of cork or other elastic material, so that the metal rings nowhere come immediately in contact the one with the other. To complete the cable a covering of hemp or other fibrous material is put on over the rings either spirally or otherwise. By the use of metal rings the conductor or conductors are effectually protected from damage and at the same time a very flexible cable is obtained. The rings also prevent the covering of hemp or other material from pressing on the conductor or conductors, which are then left entirely free from the exterior covering. *Patent abandoned.*

1153. R. PEARSELL. "Improvements in the manufacture of glass shades." Dated May 7, 1859.

This consists, 1, in connecting the side planks of the moulds to suitable mechanism so that they can be moved to or from one another, and the distances between the planks may thereby be adjusted to the different breadths of shades required. 2. In dispensing with the necessity of re-heating the glass when blowing round or cylindrical shades by blowing such shades in moulds, instead of fashioning them by heating and motion independently of any mould. *Patent completed.*

1154. W. E. GEDGE. "Improvements in the manufacture of steel." (A communication.) Dated May 7, 1859.

Instead of using mineral coal or charcoal, the inventor uses in the process of puddling wood, which wood is used dry but not carbonized. *Patent completed.*

1155. R. D. KAY. "Improvements in the preparation of certain colouring matters." (A communication.) Dated May 7, 1859.

This consists of a mode of obtaining the colour-matter produced from aniline, or other similar products obtained from coal and other bituminous substances. The inventor combines aniline, &c., with an acid so as to form a salt, the base of which is the aniline or other similar material. He obtains good results from acetic, hydrochloric, or sulphuric acid. *Patent completed.*

1157. J. RAMSBOTTOM. "Certain improvements in machinery for printing fabrics." Dated May 9, 1859.

This consists in certain improved combinations of machinery by which a lateral to and fro motion is imparted to the fabric as it enters between the engraved roller and the pressure cylinder of an ordinary printing machine. *Patent completed.*

1158. J. LUIS. "A self-regulating horse machine." (A communication.) Dated May 9, 1859.

This invention is not described apart from the drawings. *Patent completed.*

1159. C. A. H. MARCOUX. "A new impelling mover by the pressure of water." Dated May 9, 1859.

The inventor fills a column with water which he permits to flow alternately into two circular pump boxes, each having a moveable valve, so that one of these boxes may be open while the other is closed. In each of the boxes there is a flat cylinder the piston of which runs down through the bottom of the box and gears into the teeth of a balance wheel which moves with regulated precision, and from this wheel motion is given to any mechanism that may be fitted thereto. On and in each of the boxes a pipe is adjusted which is in direct communication with the reservoir column of water, and as each pump box is opened or closed by the weight of the service acting upon the valves and cylinders, the water contained therein is returned to the reservoir, so that except the

loss by evaporation its contents of water is always the same. *Patent abandoned.*

1160. F. V. HADLOW. "An improved stamp for marking linen and other wearing apparel." Dated May 9, 1859.

This consists in substituting in lieu of the metallic type, dies, stamps, or plates, type, dies, or stamps, made of boxwood or other absorbent material, with the letters, words, figures, or other devices thereon engraved or formed in bold relief. The marking inks now in use or any other that may hereafter be found to be suitable for the purpose may be applied to the type, dies, or stamps, by a piece of woollen cloth laid upon a piece of india-rubber, cloth, or other flat non-absorbent substance by saturating the woollen cloth with a small quantity of the marking ink and then pressing the type, dies, or stamps, upon the woollen cloth so saturated. *Patent completed.*

1161. G. G. BUSBY. "An improved contrivance for carrying cartridges, and to facilitate using them." Dated May 9, 1859.

The patentee claims a contrivance for holding cartridges by means of springs encircling them either wholly or in part, and also a method of taking them out of the cases. *Patent completed.*

1162. A. V. NEWTON. "An improved construction of lamp." (A communication.) Dated May 9, 1859.

This consists in applying to lamps a cap, tube, or cone so arranged with respect to the illuminating flame as to form a draught tube provided with one or more conductors so placed within it as effectually to rarify the air within, and supply the illuminating flame with a requisite amount of oxygen without the aid of glass chimney, such draught tube being connected with any suitable deflector vessel or flange which will elevate the lower orifice of the draught tube in the manner and for the purpose above explained. *Patent completed.*

1163. A. MORTON. "Improvements in means or apparatus employed in the weaving of figured fabrics." Dated May 9, 1859.

This relates to jacquard apparatus and adaptations of the loom to act therewith in the production of such goods as damask quilts, and other fabrics, when one shuttle is used, and also for fabrics of the harness work class, such as plaids and shawls, when several shuttles are used in rotation. The details of this invention are too voluminous to be quoted here. *Patent completed.*

1164. E. T. HUGHES. "Improvements in obtaining motive power." (A communication.) Dated May 9, 1859.

This consists in the use of gas either held in solution in a liquid, or absorbed by a solid body, such as coke or charcoal, and then expelled by heat, and applied as a means of obtaining and giving motive power. The operation of absorption and expulsion being continually repeated, by which the same gas is continually used. The gas intended to be employed instead of steam is ammoniacal gas. *Patent completed.*

1165. T. GREEN, jun. "Improvements in apparatus applicable to steam boilers, to obtain greater security against explosion." Dated May 9, 1859.

This consists in arrangements whereby a valve of a steam whistle (in connection with the piston) will be opened, and the whistle sounded when the supply of water fails. Also in an arrangement of apparatus for conducting the steam from a boiler into the fire-place when the water in the boiler falls below a certain point. *Patent completed.*

1166. N. BARKER and J. A. CARTER. "Improvements in apparatus for lubricating the pistons of steam-engines." Dated May 9, 1859.

According to this invention the oil, or lubricating fluid, is contained in a cup or vessel, which is fixed to the cover of a steam-engine by a hollow stem or tube, in which is applied a plug, which is caused to rotate or reciprocate at each stroke of the engine by being put in connection by suitable gearing with a moving part of the engine. In the plug is formed a recess, which, when it comes opposite the opening into the vessel which contains the oil, &c., becomes full, while the passage into the steam cylinder is closed, and when the plug is moved partly round, so as to come opposite the passage which leads into the steam cylinder, the passage between the plug and the vessel containing the oil, &c., is closed, at which time the contents of the recess in the plug will descend from the plug, and pass into the steam cylinder. *Patent abandoned.*

1167. W. F. NUTHALL. "Improvements in ordnance and fire-arms, and in projectiles to be used therewith." Dated May 10, 1859.

This consists in so rifling arms and adapting projectiles thereto as to reduce the friction to the lowest of which it seems capable, thereby to ensure ease and facility in loading, and yet maintain accuracy in

shooting; and this is accomplished, 1, by giving the inner face or bore of the barrel a perfectly smooth surface; and, 2, by adapting the projectile to the arm so that only two fine diameters shall rest upon the bore. *Patent completed.*

1168. R. J. LEE. "Improvements in steam generators or boilers." Dated May 10, 1859.

The inventor employs an outer casing or shell of any required length or diameter, and fixes it either vertically, horizontally, or at an angle within the said casing. He places three or more flues, either parallel or conical, communicating with each other by pipes, the last flue being connected with the chimney and placed close to the shell. If three flues are placed within the shell one or two may be furnished with fire-bars and doors in order to form furnaces, and the other flue or flues may be employed for lengthening the heating surface, the heated air and smoke passing through them to the chimney. In the interior of the furnaces and flues he places any number of tubes for increasing the heating surface, and causing an efficient circulation of the water, the latter passing through the tubes at various heights or distances at the sides, and also through the tops or end of the flues. *Patent abandoned.*

1169. W. WILKINSON and C. WHITLEY. "Improvements in buttons and fastenings for garments, harness, and other similar purposes, and in the method of securing the same." Dated May 10, 1859.

This consists of two or more metallic or other flexible yielding prongs or pins flat or round springing from the centre of the inner part of the button, and capable, after insertion, of being bent for fastening the button to the garment, or other article to which it is attached, either with or without the addition of a washer previous to the prongs or pins being bent. *Patent completed.*

1170. M. DEFRIES. "Improved apparatus for regulating the pressure of gas." Dated May 10, 1859.

The object of this invention is to regulate the pressure of, and in part purify, illuminating gas in its passage from the ordinary gas pipe to the nipple of the burner, or in some cases in its passage from the meter to its exit at the nipple, and thereby economise the article, and lessen the objections to its use. *Patent completed.*

1171. J. NORMAN. "Improvements in furnaces." Dated May 10, 1859.

The patentee claims constructing furnaces with passages for mixing air with the hotter portion of the fire gases, and with arrangements for inducing the subsequent thorough mixture of this mixture with the remainder of the fire gases as described. *Patent completed.*

1172. R. THOMPSON. "Improvements in shuttles." Dated May 10, 1859.

This relates to the construction of shuttles for looms, the object being to lessen or prevent the breakage or separation of the cop. This object is effected by mounting the skewer or spindle upon which the cop is placed, so that such skewer with the cop on it may be capable of yielding longitudinally in the shuttle when the latter is suddenly started or stopped. *Patent completed.*

1173. G. BELL. "Improvements in matches or fuses." Dated May 10, 1859.

This consists in the use of glass, pipe-clay, or other earthenware stems, for holding the igniting composition in order that when applied to lighting a cigar, or otherwise, the stem may not burn through, and allow the ignited composition to fall off. *Patent completed.*

1174. M. HENRY. "Improvements in heating and in supplying air, and in the apparatus employed therein, part of which improvements is also applicable to exhausting fluids." (A communication.) Dated May 10, 1859.

This consists in constructing a furnace or heating apparatus of fire-brick and metal combined; the upper parts of metal and the lower parts of fire-brick. For increasing the quantity of combustible gases, and regulating the action and temperature of the apparatus, steam is admitted at one or more points above the fire-bars. For supplying air steam is injected through a bell-mouth into a contracted part or neck of an air pipe, thereby producing a vacuum, thus causing atmospheric air to rush in through the space round the bell-mouth, and constitute, as it were, an annular current around, or concentric to, a core of steam. *Patent completed.*

1175. W. KILLER. "Improvements in cartridges for guns or small fire-arms." Dated May 10, 1859.

Here the cartridges are made with a percussion cap inserted and fastened to the end of it, so that by the action of placing the cap on the nipple of the gun the powder is liberated. The cartridge is made tapered or cone-shaped when required. *Patent abandoned.*

1176. W. O. BOVIER. "Improvements in the

means of, and apparatus for, separating metals, ores, and other substances of different specific gravities." Dated May 10, 1859.

This relates to a method of and means for separating metallic ores in which air is substituted for water. The invention is not described apart from the drawings. *Patent completed.*

1177. J. ABSTEDAM. "Improvements in impregnating illuminating gas with hydro-carbon vapour." Dated May 10, 1859.

This consists in impregnating illuminating gas with vapours formed by some hydro-carbon liquid of a high boiling point, such as coal oil, or spirits of turpentine and in the apparatus used for the purpose. *Patent abandoned.*

1178. A. MANBER. "An improved method of extracting and purifying sugar, called glucose and 'Sirop de fécule,' from potatoes or fécule, or starch or dextrine, for the purposes and uses of brewers, distillers, vinegar makers, colouring makers, or otherwise." Dated May 11, 1859.

This consists, 1, in the saccharification of a mixture of nine parts of potatoes, or fécule, or starch, or dextrine with one part of flour from rice or maize, together with forty parts of water, the said mixture to be converted into saccharine matter by the reaction of the germinated barley called malt, or by the reaction of sulphuric or any other acid, or by the action of heat. 2. In a purifying process and filtering apparatus of any suitable kind and capacity, capable of being hermetically closed, and furnished with a perforated false bottom, upon which is placed wire gauze, also layers of burnt bones, charcoal, woollen felt, and flannel. The apparatus being charged with the liquid air or steam is introduced over the mass through a cock, when the saccharified liquid is forced through the filter and perforated false bottom and purified, when it is drawn off and received in a copper for evaporation and concentration. *Patent abandoned.*

1179. A. MANBER. "The manufacture of a colouring matter for colouring spirits, beers, vinegar, and other liquids, from rice, maize, carrots, maple, ananas, pumpkins, chestnuts, mangel-wurtzel, sorgho, turnips, and Jerusalem artichokes." Dated May 10, 1859.

The inventor obtains a colouring matter, and converts into caramel by the action of heat upon the above materials. *Patent abandoned.*

1180. T. P. BEXFERT. "Certain improvements in or applicable to carding engines." Dated May 11, 1859.

According to this invention when the carding engine is at work the loose dust, dirt, and flyings that are thrown off by the main cylinder are deposited upon a creeper, and as the creeper passes over a roller they are collected on the surface of a clearing roller which is covered with flannel; or the dirt, &c., may be removed from the clearing roller by a doffing comb. *Patent completed.*

1181. J. LUIS. "An improved burling and napping machine." (A communication.) Dated May 11, 1859.

This invention is not described apart from the drawings. *Patent abandoned.*

1182. H. CLARKE. "Improvements in balancing millstones to the running as well as the standing state." (A communication.) Dated May 11, 1859.

This invention has for its object the balancing of the running stone of millstones to the running as well as to the standing state, which is accomplished by having a number of holes or recesses formed in the said stone with portable boxes, cups, or buckets placed therein for holding lead, shot, or other weighting substance for producing the standing balance, which boxes, or the weights therein, are capable of being raised or lowered in the said holes by screws or other regulating means, and thereby the running balance is effected as required. *Patent completed.*

PROVISIONAL PROTECTIONS.

Dated Aug. 3, 1859.

1792. T. P. Fay. Improvements in machinery or apparatus for obtaining and applying motive power.

Dated Nov. 23, 1859.

2642. P. M. E. and J. Marchand. Improvements in refining lamp oil made from oleaginous seed.

Dated Nov. 23, 1859.

2650. W. Keates. An improved mode of manufacturing or forming the foundation or body of compound cylinders used for printing or embossing fabrics.

Dated Dec. 2, 1859.

2727. W. Betts. Improvements in the manufacture of capsules, and in the machinery or apparatus employed therein.

2728. T. F. Bradson. Improvements in door springs.

2733. A. V. Newton. Certain improvements in the construction of coiled springs. (A communication.)

Dated Dec. 3, 1859.

2735. T. R. Russell. The application of a certain metal for the movements of watches and other time keepers.

2737. J. W. Wilson. Improvements in the mode of forming and constructing boxes or cases for postal and other purposes.

2739. H. E. Drayson. Improvements in the mode of extinguishing fires in ships, steam boats, vessels of every description, houses, warehouses, stores, or other buildings of whatever kind, and in the machinery connected therewith.

2741. R. Bond and W. Hayhurst. Improved machinery or apparatus to be employed in the manufacture of a certain description of "temples" used in power looms for weaving.

2743. N. Clayton and J. Shuttleworth. Improvements in steam boiler safety valves.

2745. E. A. Curley. Improved mechanical arrangements or contrivances for measuring, registering, and regulating the flow of liquids, and likewise for measuring, registering, and regulating the flow of liquids, and likewise for measuring and regulating the passage of fluids and vapours.

Dated Dec. 5, 1859.

2747. E. Kelly. An improved washstand, part of which is also applicable for other useful purposes.

2749. J. Benn. Improvements in drills.

2751. C. Short, T. B. Smeeton, and W. Bowler. The manufacture of bricks, tiles, drain pipes, or other articles from cinder or refuse slag.

2753. A. Lancaster. Improvements in breech-loading fire-arms, in projectiles, and in apparatus for charging cartridges for breech-loading and other arms.

2755. E. A. L. Negretti and J. W. Zambra. Improvements in stereoscopes.

Dated Dec. 6, 1859.

2757. F. Coignet. Improvements in the manufacture of beton or composition applicable for purposes of covering, building, and construction, and for various uses as artificial stone.

2759. J. Shaw. Improvements in the insulation and laying-down conducting wires for the transmission of telegrams or telegraphic messages.

2761. E. A. Wood. Certain improvements in anchors.

2763. A. Turner. Improvements in the manufacture of elastic fabrics.

NOTICES OF INTENTION TO PROCEED WITH PATENTS.

(From the London Gazette, Dec. 20, 1859.)

1792. T. P. Fay. Motive power.

1828. J. H. Johnson. Signal light. (A communication.)

1833. T. and R. Blinkhorn. Removing scale from boilers.

1835. T. Dunn. Regulating liquids; propelling vessels.

1853. G. Capper. Permanent way.

1854. J. J. Speed, jun. Pipes, tubes, &c.

1859. D. Huilett and G. Prud'homme. Gas.

1863. A. Evaux. Artificial marbles.

1865. J. Philp. Hobby horse.

1871. R. Clegg and R. Fell. Obtaining fresh water.

1876. E. Sloman. Feed water and heating apparatus. (A communication.)

1878. C. Mather. Finishing fabrics.

1891. C. Kisky and W. Jones. Sideboards.

1893. J. Chanter and D. Annan. Furnaces.

1894. E. Stone. Veneers. (A communication.)

1897. H. Batchelor. Motive power engines.

1892. J. Sidebottom. Power looms.

1901. H. J. Hyams. Wet gas meters.

1905. W. T. Henley. Ropes and cables.

1908. J. Fowler, jun., R. Burton, D. Greig, jun., E. K. Allen, and W. Worby. Ploughs, &c.

1918. H. Spratt. Fire-arms.

1936. T. Briggs. Tarpauling.

1953. W. H. Balmain. Glass.

1958. J. Samuel. Railway sleepers.

1992. J. Brine. Producing copies of letters, &c.

2076. F. Heindryckx. Railways.

2114. J. Luis. Hammers. (A communication.)

2115. J. Luis. Railway breaks. (A communication.)

2118. J. Luis. Cooling apparatus. (A communication.)

2119. J. Luis. Lantern signal. (A communication.)

2151. W. E. Newton. Condensing steam. (A communication.)

2194. E. S. Cathels and H. Splatt. Gas meters.

2248. J. M. Rose, R. Carte, and W. Pikealey. Drums.

2320. J. Carrick. Water closets.

2473. R. A. Brooman. Weaving. (A communication.)

2496. R. H. Hess. Gas burners.

2507. E. Juset. Lubricating apparatus.

2577. J. Madin. Furnaces.

2607. R. Laming. Alkalies.

2635. G. W. Lenox. Ships' blocks.

2672. M. Tildealey. Locks and latches. (A communication.)

2699. J. B. Berger. Facilitating calculations.

2729. T. F. Bradson. Door springs.

2741. R. Bond and W. Hayhurst. Looms.

2743. N. Clayton and J. Shuttleworth. Safety valves.

2751. C. Short, T. B. Smeeton, and W. Bowler. Bricks, tiles, &c.

The full titles of the patents in the above list can be ascertained by referring back to their numbers in the list of provisional protections previously published.

Opposition can be entered to the granting of a patent to any of the parties in the above list who have given notice of their intention to proceed, within twenty-one days from the date of the *Gazette* in which the notice appears, by leaving at the Commissioners' office particulars in writing of the objection to the application.

LIST OF SEALED PATENTS.

Sealed Dec. 17, 1859.

1461. D. Deas. 1533. G. & T. Wrigley.

1460. A. Jeffery. 1593. J. McIntosh.

1471. R. Harper, R. 1747. E. Hunt and H. Stokes, and T. Walker. D. Pochin.

1475. P. F. Aerts. 2181. W. Airey and J. 1481. C. L. J. Dierickx. Clayton.

1485. W. C. Fuller. Sealed Dec. 20, 1859.

1479. J. Cox and S. and 1562. J. A. Wilkinson. M. Frankham. 1577. M. Bogg.

1485. W. Rowan. 1604. C. Hagan.

1489. E. Gwyn. 1617. W. Robinson.

1492. J. Meikle. 1629. W. H. Harfield.

1496. E. Oliver. 1631. J. Taylor.

1499. A. Barclay. 1636. M. Henry.

1506. J. Apperly and 1653. C. J. Proal. W. Clissold. 1678. W. O. Carter.

1510. A. J. Dessales. 1681. J. Bernard.

1512. G. C. Grimes. 1683. C. Pottinger.

NOTE.—Specifications will be forwarded by post from the Great Seal Patent Office (publishing department) on receipt of the amount of price and postage. Sums exceeding 5s. must be remitted by Post Office Order, made payable at the Post Office, High Holborn, to Mr. Bennett Woodcroft, Great Seal Patent Office.

THE
MECHANICS' MAGAZINE.

LONDON, FRIDAY, DECEMBER 30, 1859.

ENGINEERING PROGRESS IN 1859.

THE Institution of Civil Engineers deserves commendation for many reasons, but there is one feature of its operations for which we editors are especially indebted. The Council of the Institution do for us in their annual report what it would be most difficult and burdensome to do for ourselves, viz., bring together notices of the principal engineering works in progress, or which have been completed during the preceding twelve months. This practice has the double advantage, first, of indicating the practical activities of the members and officers of the Institution; and, secondly, of enabling us to repeat to the public a very interesting review of the year's engineering advances.

Commencing at home, the state of the works for the main drainage of the metropolis, under Mr. J. W. Bazalgette, is first described in the present year's report. Attention is then directed to the progress of improving the railway communications of the metropolis, including the Metropolitan Railway and the Victoria Station and Pimlico Railway, both under Mr. Fowler; the Charing Cross Railway, under Mr. Hawkshaw; and the Twickenham and Kingston Branch Railway, under Mr. Errington. Among the lines recently completed in England, are mentioned the Portsmouth and the Manchester and Crewe Railways, both executed under Messrs. Locke and Errington; also branches from the South Staffordshire Railway to Cannock, Norton, Tipton, and Darleston; and, in the Lake District, the Conistone Railway, under Mr. McClean and Mr. F. B. Stileman. The Severn Valley Railway, under Mr. Fowler, and the extension lines to the West of England, in connection with the South Western system, under Mr. Errington, are also alluded to.

Passing to docks and harbours, the extension works of the Grand Surrey Docks, under the joint charge of Mr. Bidder and Mr. Joseph Jennings, are described. An outline is then given of works of this class recently completed under the direction of Mr. Abernethy, including the new docks at Swansea, a dock at Newport, a pier at Silloth, on the Solway Frith, where there is also a dock, and a pier and breakwater at Blyth. In all these cases, hydraulic machinery, constructed by Sir W. Armstrong and Co., was employed for working the coal drops, lifts, dock gates, cranes, &c. At Penarth, near Cardiff, the conversion of the River Ely into a tidal harbour, and the construction of a dock there, with a railway to connect it with the Taff Vale line, has been carried out by Mr. Hawkshaw and Mr. S. Dobson. At the Southampton Docks, extensive works have been completed by Mr. Giles; and at Southport, an iron pier, by Mr. Brunlees. The Norfolk Estuary works have also been progressing under the care of Sir John Rennie and Mr. Fowler, whilst at Eastbourne, water-works have been completed by Messrs. McClean and Stileman.

In Scotland, the inauguration, by Her Majesty the Queen, of the Glasgow Water Works, executed under Mr. J. F. Bateman, was commented upon; and it stated that in the west, the Castle Douglas and Dumfries Railway had been lately opened, whilst the works on the Portpatrick Railway, under Messrs. B. and E. Blyth, were advancing.

The railway system of Ireland has received considerable development. The lines from

Longford to Sligo, Athenry to Tuam, Newry to Armagh, and to Warren Point, and Dungannon to Omagh, under Mr. Hemans, as well as those from Athlone to Roscommon, and from thence to Castlereagh and Castlebar, ultimately to be extended to Westport, Ballina, and Boyle, under Mr. Fowler and Mr. Fred Barry, and from Athlone to Tullamore, Killarney to Tralee, Mallow to Fermoy, under Mr. Le Fanu, with some others of less importance, have been pressed actively forward. At Londonderry a bridge is now being built over the Foyle, under Mr. Hawkshaw, to carry both a railway and a roadway. The graving dock for ocean steamers, at the mouth of the Liffey, near Dublin, under Mr. G. Halpin, and the Cork Water Works, under Sir John Benson, have been completed.

Important lines of submarine electric telegraphs have recently been successfully laid. The cable for the Red Sea line from Suez to Aden, which was manufactured by Messrs. Newall and Co., has been submerged under the superintendence of Mr. Lionel Gisborne, the electrical arrangements having been carried out by Messrs. Siemens, Halske, and Co. This line is now being extended from Aden to Kurrachee. Other lines between Constantinople and the Greek Islands have been laid by Messrs. Newall and Siemens, and but for a defect in a cable lately submerged between Candia and Alexandria, India would probably have been telegraphically connected with the mother country before the end of the present year.

A great step has been gained in the transit to the East, by the opening of the entire Egyptian railway between Alexandria and Suez, including the extensive wrought iron bridge across the Nile at Kafr Zyat. This work was executed by Messrs. R. Stephenson and Co., and Mr. H. Grissell, under the immediate superintendence, in this country, of Mr. G. R. Stephenson; and was fixed by Mr. E. Price, under the direction of Mr. Henry James Rouse, the chief engineer to H. H. Said Pacha.

It appears from a return made to an order of the House of Commons that the Indian Government has guaranteed about forty-one millions sterling for the construction of public works, principally railways, in that empire. The amount of the guarantee is in nearly all cases 5 per cent. On the East Indian Railway, to which Mr. Meadows Rendel is the engineer-in-chief, and Mr. Turnbull the acting-engineer in India, 45 miles have been opened between Burdwan and the river More, and it is thought that in the next year the Ganges will be reached, at Rajmahal. The line between Allahabad and Cawnpore, 126 miles in length, is in full operation, and beyond, as far as Agra, it only awaits the arrival of the materials for the permanent way. Other portions of the line are proceeding with a rapidity hitherto unknown. Of the Great Indian Peninsula Railway, to which Mr. G. Berkley is the engineer-in-chief, and Mr. J. I. Berkley the acting-engineer in India, 195 miles have been opened. A further length of 50 miles is nearly finished, and an additional 50 miles will be completed, by Midsummer next. There are now under contract 785 miles, the entire system embracing lines to the extent of 1,100 miles in length. The Madras Railway, of which Mr. Hawkshaw is the engineer-in-chief, and Mr. J. M. Heppel the chief resident-engineer, has been opened to Goriattam, 96 miles from Madras, the eastern terminus. By the end of the year it is hoped it will be completed to Salem, a further distance of 110 miles, or about half way to Bepoor, the western terminus. Probably by the end of 1861, the whole of the main (south-west) line, 405 miles in length, will be opened, when

there will be a through communication by railway across the Peninsula, between the Coromandel and the Malabar coasts. In Scinde and the north-west Provinces of India, the railway between Kurrachee and Kotree, the steam service upon the river Indus, and the Punjab system of railways connecting Mooltan with Lahore, Umritsir, and Delhi, are making rapid progress under the direction of Mr. T. A. Yarrow, and the immediate superintendence of Mr. John Brunton, in Scinde, and Mr. W. Brunton, in the Punjab. Measures are being taken for prosecuting the works on the Eastern Bengal Railway, in the hands of the late Mr. Brunel until his decease, but now transferred to Mr. Hawkshaw; on the Great Southern of India, under Mr. G. B. Bruce; and on the Calcutta and South Eastern, under Mr. J. A. Longridge.

During the present year the first steps have been taken in an enterprise which promises to rival even the Grand Trunk Railway in magnitude and importance; this is the establishment of the Madras Irrigation and Canal Company, for the construction of canals of irrigation and transit throughout the Madras Presidency, and the adjoining states, and ultimately in other parts of India. The engineer-in-chief of this undertaking is Colonel J. T. Smith, M.E. An extensive iron pier is now being erected at Madras by Mr. F. Johnson. A survey of the Island of Mauritius, made at the instance of the colonial government, by Mr. J. A. Longridge, during the last winter shows the great local benefits which the railway system would confer on that colony.

Turning to the Continent of Europe, the railway system in Spain first claims attention. During the present year the great line from Madrid to Alicante, with a branch to Valencia, has been opened throughout. Other branches of this line are in progress to Toledo, and to Ciudad Rodrigo. There are also in course of construction two grand lines from Madrid towards France; first, the Northern of Spain, which proceeds by the Escorial, Valladolid, Burgos, Miranda and Vittoria, to Alsasua; second, the North Eastern route, by Guadalajara, Zaragoza, Tudela, Tafalla, and Pamplona to Alsasua, where it joins the Northern of Spain; and from whence a common line is to traverse the Cantabrian Pyrenees to Villafranca, and onward by Tolosa, St. Sebastian, and Passages to Yrun, on the frontier of France, only twenty miles from where the French lines at present terminate. Great exertions are also making on the line between Barcelona and Zaragoza. The Biscayan railway, from the port of Bilbao to Miranda, on the Ebro, and thence along the right branch of the river to near Tudela, is in course of construction by Messrs. Brassey, Paxton, and Wythes, under Mr. Vignoles. The Spanish Government appear to be anxious to push the extension of railways throughout the Peninsula, offering subventions as an inducement; but the interference of the Government in all the details of construction is a great drawback to the introduction of English capital, and to the satisfactory progress of the works.

In Italy, Piedmont, Austria, Prussia, and Holland, but little seems to have been done; while in Sweden and Norway the railways are slowly but steadily extending.

At Copenhagen Water and Gas Works have been recently constructed under the superintendence of Mr. Simpson; and a large tract of land has been recovered from the harbour, and a dry dock constructed by Mr. A. Giles. The project of Mr. Murray to extend the harbour southward, by cutting a channel through Kallebod Strand, between the islands, &

Amager and Zealand, has recently received the sanction of the Danish legislature.

The English system of waterworks appears to be making considerable progress abroad. During the past year works for the supply of Altona, from the Elbe, at a distance of eight miles, have been constructed by Mr. Hawksley, who has also commenced other works, in conjunction with local engineers, for the supply of the cities of Stockholm, in Sweden, and Bridgetown in Barbadoes.

In Russia, the Riga and Dunsberg railway is progressing under Mr. Hawkshaw, and is expected to be completed early in 1861.

In the Brazil, four commercial cities on the sea-board have been selected as the starting points of railways, to proceed into the interior, viz.: Recife or Pernambuco, Bahia, Rio de Janeiro, and Santos. The first section of the Don edro Segundo Railway, at Rio de Janeiro, has been constructed by Mr. E. Price. The works on the Pernambuco Railway are being vigorously prosecuted under Mr. Gregory and Mr. Peniston; a section, nineteen miles in length, was opened in February, 1858; and a second section will, it is expected, be completed in the summer of the next year. The Bahia Railway, which is eighty miles in length, is under the direction of Mr. Vignoles, and the immediate superintendence of Mr. Hutton Vignoles, the contract for the works having been taken by Mr. John Watson. The first section will probably be finished by Midsummer, 1860, and the entire line in 1863. Both the Pernambuco and the Bahia Railways are designed to terminate, ultimately, at the River San Francisco, about 300 miles from the mouth, at or near the point where navigation ceases. The surveys and explorations for the railway from Santos, better known as the San Paulo line, have been made, under the direction of Mr. Brunlees, by Mr. Fox. Several hundred miles of macadamized roads have been laid out by Mr. Hutton Vignoles through the province of Bahia, partly in connection with the railway. These are fast approaching to completion under Mr. Watson as contractor. The works of the Mangaratiba Serra Road have been carried out by Mr. E. B. Webb. The hydraulic works in front of the city of Rio de Janeiro are progressing under Mr. C. Neate; and Mr. Law has undertaken the construction of the docks there. Gas works have been established at Rio de Janeiro and at Pernambuco, and others are in contemplation for Bahia. Mr. C. B. Lane, the Engineer-in-Chief to the Home Government at Rio, and Mr. W. Martineau is the Government Engineer at Pernambuco.

The above review cannot be read by any Englishman without a glow of national pride. In every quarter, in almost every land, of the globe English heads, English hearts, and English hands are at work, making even the waste places of the earth glad. The Institution of Civil Engineers in particular must be proud of such a survey, for every engineer mentioned in it is either an officer, or a member, or an associate of that able and active body.

It is understood that the arrangements for the execution of the new coinage of mixed metal have made some progress, and Mr. Leonard Wyon, medallist to the Mint, has been recently favoured with several audiences of the Queen for the purpose of obtaining a correct profile of Her Majesty for the formation of the *obverse* of the three denominations of coin. It may be trusted that little time will be expended in completing the plans for the contemplated improvement, and that early in the new year the new money will be issued, to the great convenience of Her Majesty's lieges, whose pockets are now "bowed down with weight"—of copper.

ON HEAT.

EXPERIMENTS AND OBSERVATIONS TENDING TO PROVE THAT THE HEAT WHICH DR. BLACK DISCOVERED TO BE ABSORBED DURING THE LIQUEFACTION OF ICE, AND WHICH HE CALLED LATENT HEAT, IS NEVER GIVEN OUT AGAIN ON THE FREEZING OF WATER, WITH REMARKS ON A PECULIAR PROPERTY WHICH SEEMS TO BE DEVELOPED IN WATER AND MANY OTHER FORMS OF MATTER ON CHANGE OF STATE.

By HORATIO PRATER, Esq.

(Concluded from p. 406.)

LET me now examine some of the most recent observations on this subject, contained in the *Phil. Mag.* for March, 1860.

(1.) "Water may be cooled to 22° without freezing, and apparently kept so any length of time unless touched by a piece of ice or other solid, when the water freezes and becomes warmer." This is ascribed to "the existence of cohesion among the particles enabling the water to withstand a change of temperature, which, without the cohesion, ought to have caused a change of state."

(2.) "Donny has heated water to 270° (at common atmospheric pressure) without its passing into steam; into which, however, it does when a particle of air or vapour touches it, when it explodes, its temperature falling." See also Péclet (Tom. II., page 153, 1850) where water was heated without boiling to 246° by covering it with a layer of oil previous to boiling to expel the air.

(3.) "The growth of crystals seems to depend on this attraction of cohesion, as this matter is attached to such crystals, and does not deposit so easily elsewhere."

I have selected the above three paragraphs for comment, because they seem to contain the last opinions of one of the most laborious experimentalists of the age, and because it will be seen they differ widely from the opinions I have already in this essay ventured to propose on the same point.

Now that cohesion exists, or may be developed in water is clear from M. Boutigny's experiments, among others, who found that when it rains into a red hot crucible, the water still passes into a spheroidal state. I say this experiment proves that a wonderful cohesive force may be developed in water, but as cohesion in the above extract (No. 1) is said merely to "exist," without giving the reader any opinion as to whether this cohesion may not be increased or diminished in certain circumstances—in short, whether this cohesion is not, like irritability, a VARIABLE quality, I think it may be regarded as no explanation whatever of the fact that water may be cooled to 22° and (as I before stated) even to 5° without freezing.

If the above theory of "cohesion existing" had any real meaning the author should have expressly stated that as touching water at 22° with a solid causes freezing, it follows that the mere *slightest touching can diminish cohesion*. But can such be a physical property, or is it not certainly far more like a physiological property? Undoubtedly it is, for to "diminish cohesion" in what is called inanimate matter, you must not merely TOUCH SLIGHTLY, and observe, too—at one small point—but, as we all know (at least in the case of solids), use great force and touch all parts, or the cohesion of the solid will not be overcome and a powder formed. The author in question was also bound to try and explain how such mere touching could diminish cohesion, and yet this cohesion be (as he never even ventured to doubt) a mere physical property. And mark, by "diminishing cohesion" in the above case, we actually form a greater quantity of cohesion—for we form ice from water—a body hard from a body soft. When a muscle is even barely touched, there is a sudden increase of cohesion and increased hardness from contraction, produced by this irritation of touching.

In a former essay, while commenting on the fact that solid carbonic acid may be held in the hand without producing a painful sensation of cold, until contact is established by mixing it

with ether (Boutigny), I have noticed the strong analogy that exists between great degrees of heat and great degrees of cold. In the present occasion the analogy also holds, for as the cohesion of water in the spheroidal state is increased by the heat, so as certainly in the case of ice it is by the cold. In every case of freezing, then, we have proof that cohesion is a variable quality, and that a vast increase of this force is actually generated either by excessive heat or excessive cold.

But the most remarkable point in the case of water (and a very few other bodies) is, that expansion should take place, and at the same time cohesion be increased so greatly in the ice formed. This fact gives rise to another equally singular, viz., that (as Forbes and Tyndall have lately found) the cohesion of ice, contrary to what happens with substances in general, is actually diminished by pressure, and consequently that it is by this means changed again to water.

The above reasoning applies equally to (No. 2), where we find the mere touching water at 270° causes in this case a reaction, in the form of actual explosion. Yet that these effects, so different—in the first case ice, and now vapour—are produced by the same physiological cause I see no reason to doubt, for they resemble each other in this main feature, viz., a great change of state has been produced by the irritation applied. It was physically impossible that water above boiling could be turned to ice as it is when cooled to 22°; it shows, then, but in another way (viz., by explosion), that a NEW faculty (*visus*) has been developed in it. In both the above cases matter is put into a FORCED state, just as it is in living bodies. No doubt the degree of irritability produced is far less, or perhaps somewhat different, but in its main feature it is the same.*

In (No. 3) the growth of crystals is ascribed to this cohesion again, and probably here with truth; though some opinion on the nature of this force, that makes it prefer contact with its own particles to those of other matter, might again have been expected.

I have already in a note alluded to a very curious property in regard to the crystallisation of carbonate and sulphate of soda, when in what may be called super-saturated solutions, by which means they are brought to a sort of tension (so to call it), a state in which—like water at 22° (water super-saturated with cold)—an extra portion of irritability seems to be developed in them, or to say the least, their own inherent irritability seems put in the very rare circumstances in which it can manifest itself to the chemical philosopher. Probably the case of fused tin already given, and also of "phosphorous and sulphur which often remain liquid at the common temperature of the air, but touched by a rod give out heat and become solid," says Thomson (p. 174), should be added to the above peculiar states of tension of matter. Thomson himself has grouped them together, but it is singular that while he has given us such a detailed examination of the cause of the heat in water cooled to 22°, and of the solutions of carbonate and sulphate of soda, he has totally passed over any attempt to explain the cause of this evolution of heat in melted sulphur and phosphorous, as he formerly did that of fused tin, and wisely, for the mere mechanical theory of latent heat seems wholly inadequate to explain this surely instantaneous generation of heat.

* In Péclet's experiments, above given, if the temperature is raised above 246°, a great quantity of explosive vapour is generated. As the water is put in what may be called a very unnatural state (all its air being first removed and a layer of oil preventing its contact with fresh air), no wonder that an extraordinary power of resistance to change of state is developed, and that this *visus* increases its tendency so much to expand that it becomes explosive.

In Regnault's "Cours," Tom 2, p. 363, the atoms of glass seem put into this forced state by letting melted glass fall into cold water, by which means "the surface is made to solidify while the interior is at a high temperature." When this surface, "even in a minute point," is broken, the interior explodes and flies off into dust. The curious part in this experiment is, that the internal atoms retain this explosive power, and do not gradually lose it by cooling.

Chloride of azote and all other explosive compounds may be grouped under the same head of matter placed in a FORCED state.

Applying the above reasoning to the case where the *lowest* forms of life *seem* (to say the least, after the late discussions in the *Comptes Rendus* for the present year) produced in fermentation and putrefaction, it would appear that the *nisus* developed in these cases more ostensibly than in the others noticed in this essay, arises, however, like that of water, &c., &c., from matter being forced to change its state. In fermentation and putrefaction especially, the atoms are about to be robbed of their accustomed state of cohesion by the, at last, conquering force of the chemical affinity of the oxygen of the air. The *nisus* to resist is developed—and is it too much to suppose, after the great number of able writers on the side of spontaneous generation, that the lowest forms of *integral* life *therefore* result, and not merely as in the cases of water, &c., &c., a *half* developed state of irritability?

I conceive the *generation* of heat in certain and peculiar circumstances as proved: but it seems a law of Nature that what is susceptible of generation is also as a necessary consequence susceptible of annihilation, or as applied to organized matter—of death. This reflection renders it probable that heat may *sometimes* be annihilated; and that it should be more often annihilated where it enters water or ice than in other cases is rendered still further probable by the *natural antagonism between fire and water*, so that we throw water on fire almost by instinct when we wish to extinguish it. Nevertheless, that the 140° that enter in to liquify it are annihilated (or even converted to other force) I still only venture to suggest as most highly probable; and shall pursue these inquiries at length, as connected with the subject of specific heat, before I venture to say we have *proof* on the subject—the object of this essay being to *prove* they cannot be all given out again.

At present I shall merely state the obvious fact that if water were heated or cooled as rapidly as mercury, certainly the vast majority of fish would necessarily perish. There *seems*, then, to be a *final* cause for the great “capacity” of water for heat; as also by its expansion (and consequent increase of levity by freezing), since by this rising of water about to freeze to the surface, the under portions are prevented from freezing in a great measure, I believe, by the fact already mentioned in reference to water cooled to 22°, viz., that *contact with air* hastens congelation; and, secondly, that when ice is formed at the surface, Tyndall's experiments with Harrison's freezing apparatus show that it took, in the month of April, nine hours' constant action to cool ice from 32° to -3° (or 35°). And that on stopping the apparatus, the heat rose to 27° in about an hour and a half only (*Phil. Mag.* Nov., 1858). In this case the heat of the air was no doubt at temperature; but we may still infer that when the external air is at 22°, or less, it will take a *very long time* to cool the ice of lakes or rivers to that point, and consequently that a superficial layer of ice may in one sense, to say the least, actually prevent the freezing of the water underneath it by preventing not only the motion above alluded to of material particles in the air, but also from its acting as a sort of non-conductor of cold when the temperature of the air falls below 32°.

As the great antagonist power of heat, I have had occasion in two or three places to show that *cohesion* has, in reference to its capability of *variation*, more of the nature of *life* than is commonly supposed. I here add a few more points in favour of this view:—

1st. The solids in living bodies are deposited in a far greater state of cohesion than they are in inanimate matter; witness the state of powder without cohesion, in which solids are precipitated from solutions compared with the tenacity of muscle, tendon, and of wood. The cohesive force *unites the atoms of organic matter together*; otherwise, like the precipitates just noticed, they would be incoherent masses.

2nd. That cohesion seems to act *spontaneously* in living bodies; while its action in inanimate matter seems, generally speaking, to require the

EXISTENCE of pressure, or of cold, or of both these agents combined, to enable it to act. So that in living bodies it chiefly merits the name of an *active* power. Hence the probability of its being some modification of the vital power.

3rd. That when heat is withdrawn, its very great force in producing ice shows it to exist as a *very active* agent in water; particularly at the time of freezing—a fact which, to say the least, makes water a fluid *sui generis*.

P.S.—In different parts of this essay, I have considered it possible that heat may be separated into “pure repulsive force,” and into that which can cause the sensation of pain in us. I now think that these properties are one and the same, and that pain arises from the repulsive power tending to *separate the tissues forcibly*. As the temperature of ice is not raised during its formation, it seems, however, probable that the repulsive power of heat may be sometimes separated from its power to raise temperature. We find these powers separate in Nature: for by applying *mechanical* power *very gradually* we may scarcely raise temperature at all, and yet obtain the result, of repulsive power, viz., greatly *increased bulk*, as in the case of ice.

Sometimes, however, mechanical force may be employed to *compress atoms*. It should therefore perhaps be called a passive force, as it may produce opposite effects, the will being the *active force that directs*.

APPENDIX.

On reviewing my essay, I find two or three points that seem to merit further notice.

1st. Not wishing to increase scientific heresy, so to call it, further than the interests of truth appeared to require, I adopted, without much reflection, 140° or *thereabouts* as the “heat of fluidity” of water. I will now venture to suggest whether this is not far too high, since we know that *when we heat water to a point far below this we can't bear the hand in it*; but also more especially since by the experiments given at the beginning of this essay, we find that water at 32° still makes water at 172° fall to 70°, while snow made it fall to 36°, whether we ought not to deduct this 36° from 70°, and put down the difference, viz., 34°, as *about* the latent heat, or rather heat of fluidity of water? These 34° seem the real quantity of heat converted or lost in consequence of snow or ice (at 32°) being used instead of water at 32°, which *seems the main question*; though of course I admit that even in my experiments 136° (and in Dr. Black's 140°) disappeared when snow or ice was converted into water by being mixed with water at 172° “without raising the temperature of (as Thomson says, p. 163) the snow or ice.” (His grand argument for making 140° the heat of fluidity.)

When by mixing water at 32° and at 172° the whole in my experiments became 70°, it may be said in one sense that 102° have disappeared most certainly, although as in reality they have only been employed in raising the temperature of part of the water from 32° to 70°, they are sensible to the thermometer, and cannot be called “latent.” But still they surely should be deducted from the 136° that disappeared when mixed with *snow* and water at 172, and 102° from 137° will leave us 34° (as stated above), as surely a nearer APPROXIMATION (for by the text it will be seen others differ from Dr. Black's No. of 140°) to the heat of fluidity of water, than the said 140°.

Again, it is highly improbable that ice can ever get even in the *slowest* way a heat of 140° to melt it, seeing that thawing begins a little above 32°. Even supposing the air at 45°, what a long time it would take to accumulate these 140°.

By reference to the experiments at the beginning, it will also be seen that when I doubled the proportion of snow, I could not cool the water below 36°, nor when I doubled that of water at 32° did I get the temperature lower than 70°, the point to which the mixture of 1 part at 32° and 1 at 172° ULTIMATELY fell. This seems to show you cannot always ultimately augment intensity of cold, in water at least, merely by increasing the

quantity of cold by means of adding fresh portions of colder water. No doubt when the proportion at 32° is doubled, the thermometer will fall to 70° in *far less time*. I have made further experiments on this point, but they are still not sufficiently extended to find an error in the above inference, which still I confess seems very improbable.

Since the essay was written, I have also exposed water in a tightly corked bottle, and also in one loosely corked (in each case very little air being in contact with the water), to the freezing temperature. The former did not freeze, the latter did. This shows that the contact of air, *abstractedly considered*, does not seem to promote freezing, until this air is (as in the bottle loosely corked) enabled to move, though even in a *limited degree*. This confirms Thomson's and Regnault's statements (see text) that air causes water cooled to 22° to freeze, by its producing MOTION in it, like any other solid, for these, says Thomson, act in the same way.

According to Thomson's tables (*On Heat* pp. 26-27) Rose's fusible metal and phosphorous expand *very suddenly* at their melting points, and as Thomson says, “quite independent of the temperature added,” because far beyond such small increased temperature. The *nisus* then of these matters to resist, just as they are having change of state forced upon them by heat, seems no less clear, from the, so to call it, spontaneous dilatation than from the equally spontaneous dilatation of ice at its formation, certainly not from heat, since, in this case, it is being subtracted. Yet Thomson never speaks but of the “spontaneous evaporation” of water.

I have stated in the text that I doubted if more than the *mere* surface of water could ever be frozen if 140° had to be given out. In consequence of the air having been lately at Paris at from 16° to 18°, I have been able by the following experiments to *prove*, I think, the truth of this supposition, since on two occasions—once in a small tin vessel, and once in a common tumbler—I found *complete* freezing of the surface to take place in 17 minutes, and on breaking the surface of the ice and pouring out the water, I found a solid crust of ice all round the sides and also at the bottom, so that *this water, which certainly in another hour would have been all frozen, WAS COMPLETELY SURROUNDED BY ICE*. Here, then, is an *experimentum crucis*, for how could it give out these 140° and not melt the ice?

2. Though the *freezing was so very quick*, I could not detect any rise of the thermometer on holding it over this water while freezing. And a thermometer kept in the water during freezing did not sink certainly below 30° during that process, though the air was at 17°, verifying Thomson's statement. The atoms during freezing being in want of a heat up to 30° or 32°, retain it in opposition to the air by the *nisus* developed, and employ it (the heat of fluidity) in the expansion which takes place. So strong and wonderful is this power that I found that even by putting water in a mixture of snow and salt I could not make it sink to the temperature of the air, though oil so placed very soon fell to 20°, for as this did not freeze there was no *nisus* produced to keep up its heat (otherwise it would probably have kept far above the temperature of the air, as water does).

In these experiments I found water was frozen into a firm solid in glass vials, and that the *lateral* seems certainly as great, if not greater, than the upward pressure, as on one occasion the vial was cracked on all sides, though I had merely pressed a piece of paper round its mouth (WITHOUT TYING IT), which, too, was full $\frac{1}{4}$ of an inch from the surface of the water; and on another occasion a narrow-mouthed cup covered LIGHTLY with a tin cap was cracked. The necessity to freeze suddenly being so strong, did these act as irritants, and *increase* the lateral expansion? At all events, the motion of freezing is very different from the motion of *fluids* when they are pressed on, for they would soon have forced the paper or cap off, where the pressure was least.

4. Although, as already stated, water may be

cooled to 22° or below by perfect exclusion from air, yet I found it always *ultimately* froze into a firm solid when the air was at 18°. A mechanical cause, then, here clearly at least *assists* this possibility of remaining fluid at 22°, and it is the fact that when the atoms of air are confined, they of course cannot move away when they have robbed the water of part of its heat, and thus give place to colder ones. Thus, when bottles of water are tightly corked as this cannot cool so *quickly* as when exposed to air, the atoms of water are not *hurried* (so to speak) to a new and forced arrangement. Hence the water remains fluid even below 22°. It can resist slow, but not rapid, abstraction of heat.

That, however, all this is a mere *question of time*, was shown by my experiments when the air was only at 24°. In this case water remained fluid two hours before the surface was *FULLY* frozen, while we see above it froze in 17 minutes when the air was at 16° and 18°.

SUFFIELD'S ENGINE-ROOM TELEGRAPHS.

It gives us much pleasure when we are able to lay before our readers descriptions of machinery or processes of manufacture which are actually in successful and daily operation, as distinguished from those inventions with which we have frequently to do, and which are occasionally little more than crude ideas, found to involve considerable labour in working them out before arriving at results which fully answer the purpose intended. It not unusually happens that inventions in the course of being rendered really workable are so far modified from what was at first conceived that little resemblance remains in them to the things they were expected to be like, inventors frequently abandoning their original ideas altogether, new lights breaking in upon them as they proceed. It is peculiarly satisfactory when we can witness any arrangement of mechanism which has passed through these uncertain stages of its existence, and become sufficiently perfect to warrant us in presuming that it is subject to no change which can either increase its efficiency or even diminish its cost, all being done that is necessary in both these directions.

The invention which we now propose to describe, although in its perfected form exceedingly simple, is just one of those which has passed—to employ a piece of common but indifferent imagery—through a most fiery ordeal, but from which it has escaped thoroughly unscathed. It is one, moreover, which presents this peculiarity, namely, that if it had not been rendered perfect it would in all probability be worse than useless to attempt its adoption, as it might bring about the very calamity the occurrence of which it is designed to prevent. From the first time steam-vessels were started, their comparatively rapid movements when compared with sailing-vessels has rendered it hazardous, both to themselves and other craft, to work them in crowded or confined places when their steam-power was employed, and perhaps even more so when running with full steam in the open sea, in the dark, or in hazy weather. To suddenly stop or move, especially to change the direction of motion of a heavy mass like a large vessel under full steam, is no easy matter even under the most favourable circumstances, but when this is required to be done in rough and boisterous weather, with steam blowing off at the time, or, in the case of war-vessels, when evolutions are necessary during an action amidst the din and roar of cannon, sudden movements or stoppages are rendered *absolute impossibilities unless means are provided*

for communicating instantly and with certainty from the person in charge of the vessel to those in charge of the engines. The old and still not uncommon plan of stationing men at certain intervals along the upper deck, and in large vessels on several of the lower decks, to pass the directions of the commander to the engineer, is one not only most expensive, as it involves several hands being employed, but one upon which no dependence can be placed, directions being frequently misunderstood, besides taking several seconds or even minutes in being transmitted. Most captains of vessels in the merchant service have, during the last few years, been fully alive to the importance of the adoption of some more perfect means of communication, but it was not until several vessels had been totally lost and many very seriously damaged from want of these means that their owners acknowledged the importance of what had been devised to further the safety of their property.

The invention and general arrangement of marine engine-room telegraphs of which we here give illustrations, have been perfected by Mr. T. Suffield, of Bermondsey-wall, after several years of practical experience with them on board British and foreign merchant steamers and foreign government vessels, and, as we have said, very recently on board the vessels of H. M. Navy. We are much pleased to learn that the Lords Commissioners of the Admiralty have just given Mr. Suffield extensive orders to fit several line-of-battle ships and frigates with these valuable and useful instruments. In a recent number we laid before our readers the result of a series of experiments with the above and other telegraphs carried out at Sheerness under the able direction of Capt. Halsted, and noted the superiority which the telegraph under notice maintained. On board the Great Eastern, also, Mr. Scott Russell and Captain Harrison fully acknowledged the great services these instruments had rendered while steaming down the river, and the reliance they placed in their accuracy. This favourable opinion was completely shared by the engineers working the paddle and screw engines.

In proof of the very rapid action of these instruments we may relate the following circumstance which occurred on board the Great Eastern on her passage round to Holyhead. One of the sails getting loose, and the wind dashing it in contact with the lever of one of the deck dials, caused the indicator to fly round from "full speed" (ahead) to "full speed" (astern). Such a sudden signal to the engineers of the screw engines very naturally much surprised them, but in obedience to the signal, the engines were almost momentarily reversed, thus proving what could be done in a time of need, the engineers below imagining nothing short of some vessel having come across the Great Eastern's bows or other like catastrophe. Captain Harrison instantly noticed the reduction in the speed of the vessel, sprung to the dial, and gave a counter-order, which was carried out without a word having been spoken, and in the same time as before by those in charge of the screw engines. On the circumstance being communicated below to Mr. Langdon and Mr. Beckwith, who were in charge of the screw engines, and representing Messrs. Boulton and Watt, it caused some degree of pleasure to learn there had been no danger, but proved most completely the possibility of rapidly and with certainty passing the word without any chance of being misunderstood.

We here endeavour to show the various fittings and the mode of working the telegraphs when fitted to merchant steamers, as also to line-of-battle ships and frigates. The deck dials for use of the commander consist of brass domes *A A*, Fig. 1 and 2, fitted with internal lamps and reflectors, and a divisional dial *B B*, Figs. 5, 6, and 7 (the latter on an enlarged scale), glazed and lettered in glass for illuminating by night. To prevent the whole surface of the illuminated dial

affecting the sight of the commander when taken off it, a simple and efficient arrangement is made, termed a night-shade, which by the working of the lever opens to the sight that division only which has upon it the signal which is to be communicated. These domes *A A* are fitted in the most convenient place for instant communication by the commander at each side of the ship, as we have said, either on the bridge or in the hammock nettings near the gangway, or sometimes on the poop, connections being made from them by gearing very neatly and substantially arranged, as shown at *C C*, Fig. 1, consisting of bevil wheels fitted in cast-iron brackets fixed in convenient positions against the side of the ship or on the side or underneath the deck beams; the shafting from each side of the ship meeting at or near the centre of the vessel at *D*. From this point the shaft either dips vertically or runs along horizontally (fore and aft) as the case may be, to the engine room through the deck beams, or in the most suitable manner, and terminates at the back of the engine-room dial *E*, Fig. 4, when the communication is complete. In order to ensure that no strain can be put upon the shafting and gearing when the ship is taking in her cargo, or working in a sea-way, Mr. Suffield has arranged a very simple piece of mechanism termed an "expansion joint," *FFF*, Fig. 1, which admits the whole of the gearing working with a degree of accuracy and freedom otherwise unapproachable.

One of the most important parts of the arrangement consists in the engine-room dial and gong—Figs. 3 and 4—which are remarkable for their simplicity, certainty of action, and non-liability of derangement. They consist of a powerful gong, worked in conjunction with a figured dial (Fig. 3), protected and secured by a brass glazed frame under lock and key, in charge of the chief-engineer. This dial is fixed immediately before the engineer, on the opposite side to the starting gear, in a convenient and open position. The commander, communicating from the deck dials, causes the gong to sound at every move of the index-hand of the engine-room dial, which latter at once shows to the engineers the order given. This index cannot be passed from one word to another without striking the gong and calling the immediate attention of those below. Another important arrangement consists in fitting "attention" bells both in the engine-room at each deck-dial (worked by foot or otherwise), by which a communication can be kept up between the commander and engineer during stoppages or other causes previous to giving orders by the engine-room telegraph which are imperative, the telegraph never being touched except it be intended that the order given should forthwith be carried out. This completes the arrangement of communication.

The distance from the bridge to the gangway is, however, in some vessels we have seen as much as 80 feet, and unless dial plates are also fitted in the former position, men must necessarily be employed to pass the word from the commander (if on the bridge) to the man near the gangway, by whom it would be passed backwards to the engineer by means of the telegraphs.

We are informed that Mr. Suffield has been making a number of double-acting telegraphs for a foreign government; also some for an eminent engineering firm. We trust the advance he is now making will reward him for the indefatigable attention he has given to perfect the instruments having practically experimented with them for some years at a considerable outlay, with the determination to produce an efficient and durable instrument, and one which should answer every requirement for the prevention of derangement. From what we have seen of the invention we feel satisfied that he has succeeded in producing all that can be desired, and most heartily wish him success in getting the instruments into general use. We hope soon to be able to lay before our readers a simple and efficient steering apparatus to be worked in conjunction with these telegraphs, and which is now undergoing completion by the same manufacturer.

SUFFIELD'S ENGINE-ROOM TELEGRAPHS.

THE CASE OF HENRY CORT,
AND
HIS INVENTIONS IN THE MANUFACTURE
OF BRITISH IRON.

BY
THOMAS WEBSTER, M.A., F.R.S., &c., Barrister-at-Law.
XII.

On the 22nd May, 1800, Henry Cort died, and was buried in Hampstead churchyard, having enjoyed only six years the pension of £200 a year granted on the memorial to Wm. Pitt. The extension of a pension of £125 to his widow was not likely to satisfy the sense of justice of those who were reaping the benefit of Cort's inventions without any payment to their benefactor, the rest of the family being left wholly without compensation for the injustice to their father.

At a general meeting of the British Iron Trade, held at the King's Head Inn, Gloucester, on the 29th March, 1811, present the representatives of 14 firms of the principal manufacturers then using the patents for puddling and rolling, a petition was presented by Mr. Robert Thompson, uncle to the late Alderman Thompson, from Elizabeth Cort, the widow of Henry Cort, representing the pecuniary distress of herself and family. The meeting in consideration that the iron trade was much indebted to her late husband for his inventions in the manufacture of iron,

Resolved,—“That a subscription be raised for her relief, that the disposal of the same be referred to a committee of four gentlemen, to consider how it should be converted for the use of herself and family, and that such a subscription be transmitted to the bank of Hill and Co., Stourbridge.”

Resolved,—“That such committee shall consist of Mr. Reynolds, for Shropshire; Mr. Robert Thompson, for South Wales; Mr. Gibbons, for Staffordshire; Mr. Butler, for the North.”

The list of subscribers composed forty-one firms then using the patents, and the sum subscribed amounted to £871; being a contribution of 30 guineas from one, and 20 guineas from forty firms, in acknowledgement of the enjoyment during twenty years of inventions, which but for the extraordinary circumstances above set forth would probably have yielded to the family a quarter of a million sterling. The firm of Crawshaw, Hall, and Bailey, who were prominently indebted to Henry Cort, he having personally superintended the erection of their works from his own plans, assisted by his own workmen, headed the list with the largest subscription. The amount due from that firm under the contract signed by the late Mr. Richard Crawshaw, and secreted with the patents and other contracts by the Treasurer of the Navy in 1789, was not far short of £25,000, for iron manufactured from 1789 to 1798, during the subsistence of the patent right.

The amount so subscribed has been occasionally contrasted with the £250,000 which would have been paid in royalties for patent right, and with the much larger amount of profits made by the manufacturer, by reason of Cort's labours during the subsistence of the patents; and contrasts have been suggested unfavourable to the liberality or generosity of the persons engaged in a trade which received so great an impulse from the labours of Cort. But it may be doubted whether this is quite a proper view of the matter; if the contracts and patent rights had been enforced the amount of the royalty, and something probably in addition, would have been added to the trade price of the manufactured iron. The public would have paid in the price of the article the amount which Cort ought to have received as his reward and

remuneration. That the iron masters, as a class, are extremely wealthy cannot be doubted, but there have been great periods of depression, and the trade has for a century past been in the hands of a sufficient number to ensure keen competition whenever the profits of manufacture might happen to yield an extraordinary return on the capital employed.

The case of Henry Cort ought to be urged as a claim on and against the nation rather than the iron masters; the nation at large has benefited by his genius and laborious persevering industry; the civilization, the comforts, the convenience, the capacity of the community, has advanced with the manufacture of iron in a most wonderful manner; the Railways, the Britannia Bridge, the Crystal Palace, and the Great Eastern, are types of this advance of the iron age of the last half century.

The iron-masters encouraged Cort's inventions, they were no party to the defalcations and to the gross injustice of the seizing and locking up the patents until after the expiration of their respective terms. The gain from Cort's inventions has been a national gain; the injustice which deprived him of his certain reward was the fraud of public officials; the compensation for such injustice should be a national act.

The meeting at Bristol was followed by a petition to the House of Commons from Coningsby Cort, the eldest son of Henry Cort, as to which the journals (vol. 67, 24th January, 1812, p. 77,) contain the entry, of the petition on behalf of himself and the family of Henry Cort, consisting of a widow and nine other children, being presented to the House of Commons by Mr. Manners Sutton, by command of His Royal Highness the Prince Regent, who recommended it to the consideration of the House.

A Committee of the House of Commons was moved for by Mr. Manners Sutton, then Judge Advocate, and appointed to inquire into the claims of the petitioner. The committee comprised the Secretary to the Treasury, the Secretary to the Admiralty, and the Comptroller of the Navy; the son of the defaulter who had ruined Henry Cort, and whose impeachment had taken place only a few years before, was at the time first Lord of the Admiralty; votes influenced by the relatives of that defaulter were important to the Ministry struggling to carry on a war at a great cost in the face of a powerful opposition. This was an inconvenient, not to say a dangerous, crisis for the renewal of the political agitation attending the impeachment of Henry Cort's destroyer only six years before, a revival which must have led to the inevitable consequence of a full inquiry into the petitioner's claims, involving as it would the merits of Henry Cort and the cause of his ruin.

The case of the petitioner was supported by Mr. R. Hill, brother to Mr. Anthony Hill, the only surviving iron-master who witnessed the introductions of Cort's inventions; Mr. Benjamin Hall, father of Sir B. Hall, the present Lord Llanover, partner in the firm of Crawshaw, Hall, and Bailey; and other experienced iron-masters; one witness was called by the chairman in opposition, Samuel Homfray, who attributed the improvement in the iron manufactures to some improvements of his own, founded on, so to speak, and involving the processes of Cort; his “finer's metal” as it was called, being subjected to the puddling process of Cort. Upon such testimony, notwithstanding that Homfray had concurred in the resolutions of the meeting at Gloucester, and been a subscriber to the fund then raised, and had twenty-five years before written the letter

already quoted in direct conflict with his subsequent statement, the committee suddenly closed the investigation, excluded all evidence in explanation or refutation of his statements, and reported to the House that though a considerable share of merit was due to Henry Cort they could not satisfy themselves it was sufficient to entitle the petitioner to a Parliamentary reward. The committee further reported, recommending that in consideration of Henry Cort's share of merit the expense of prosecuting the petition should be defrayed by a vote of the House.

It is more than probable that the same political considerations which had led to the hasty and premature closing of the inquiry rendered it advisable that the chairman should not move the vote of the payment of the expenses, amounting to £250, which the committee had recommended, and that all future applications for any investigation of the excluded evidence which might have re-opened the whole question should be discouraged. Certain it is that the House never was moved for the payment of the expenses so recommended, that Mr. Coningsby Cort and the poor applicants had to bear and discharge the expense of the petition, amounting to £250, and that the children of Henry Cort were never able to obtain an inquiry into the voluminous mass of evidence collected within three months of the close of the inquiry from the most eminent men, in refutation of the disingenuous and unexpected statement of Mr. Samuel Homfray.

It cost Mr. Giddy, the chairman of the committee, nothing to state, when this mass of evidence was laid before him, that had it been in time the report of the committee would have been very different; but there was no excuse for his omission of the simple act of justice to move for the payment of the expenses incurred by the petitioners in the investigation, as recommended by the report which he had signed.

Public opinion never acquiesced in the decision of the Committee of the House of Commons upon Cort's claims. The following answer to the application to the Treasury was an evasion of the question, dictated probably by the political considerations already referred to:—

“Treasury Chambers, 14th Aug., 1812.”

“SIR,—My Lords Commissioners of His Majesty's Treasury having had under consideration your memorial, dated 31st ultimo, praying that some allowance may be granted to you towards reimbursing the expenses incurred by you in making application to Parliament for a reward on account of the discoveries made by your father in the mode of converting cast iron into malleable iron, and of the rolling it into bars, but which was not granted; I have it in command from their Lordships to acquaint you that your application having undergone the decision of the House of Commons, my Lords cannot exercise a discretion in opposition to the sense declared by the vote of that House.

“I am, Sir, your obedient servant,

“H. WHARTON.”

“Mr. Coningsby Cort, King-street, Bloomsbury.”

The expenses had never been brought before, or the subject of any vote of, the House of Commons, so that the above answer was, on any view, an evasion of the question. The result of the petition to the House of Commons gave no great encouragement to the hopes of adequate compensation or remuneration to the Cort family; the widow, Mrs. Cort, continued to enjoy her pension of £125 until her death in 1816, and after her death a pension of £25 6s. was granted to each of her spinster daughters. Such was the only national acknowledgement

of the merits and wrongs of Henry Cort until 1856, when by the bounty of Lord Palmerston a pension of £50 was conceded to Richard, the youngest and only surviving son of Henry Cort.

By the exertions of Richard Cort, who after nearly fifty years' service in offices of trust in the Pendlawdd Copper, and British Iron, and other companies in succession, public opinion has, through the press, been aroused to the injustice of permitting the only three surviving children of Henry Cort to end their days in a penurious subsistence.

In May, 1855, Richard Cort addressed a memorial to the Treasury, but their lordships declined to re-open a question on which they had adjudicated. The chairman of the council of the Society of Arts, Dr. Booth, in his annual address on the 21st of November, 1855, alluding to the fortunes of the hapless inventor, instanced Henry Cort as one of those "who enrich the nation but beggar themselves," neither he nor his audience being then aware that he had been no victim of ordinary misfortune or ill luck, but had been sacrificed to official delinquency.

Since then the subject has been taken up by many of the most eminent men in the country, and sums of money have been subscribed to enable Richard Cort to press the claims of the three survivors on the attention of the nation. Richard Cort, with an energy and perseverance worthy of his name, has since 1812 endeavoured to rouse a sense of the claims of his family on national gratitude, and not wholly without success, as evidenced by the pension conceded by Lord Palmerston in 1856 already mentioned, upon the report of Sir Roderick Murchison and Dr. Percy, directors of the Metallurgical Department of the School of Mines, on Cort's inventions.

The public press, with singular concurrence and unanimity, has urged the claim of Richard Cort and his two aged spinster sisters on public sympathy and support for their declining years, and greater unanimity of public opinion never existed on any similar question; and on a review of the parliamentary bounties which have been awarded it may be doubted whether any case can present claims comparable to these of Henry Cort. The present occasion is well timed, the nation having at this moment a very large and annually increasing surplus from the funds levied on inventors under the new system of patents.

The official fees paid by inventors during the first seven years ending the 1st of October, 1859, reached an amount greatly in excess of the expenditure during the same period, on objects for which inventors and inventions can derive any benefit, so that the nation now owes to inventors a very large surplus of cash in hand. Can there be a more appropriate application of a portion of the surplus so absorbed by the Consolidation Fund than a bounty to meritorious inventors or their families, who from whatever cause have not derived any adequate reward or remuneration for the benefits conferred on the nation.

This, though pre-eminently an inventor's question, is not without deep interest to all men of science and literature—in fact, to all who live by intellectual labour, in whatever form it may be embodied.

Mr. Fairbairn has recently come forward in the most liberal manner to head a subscription, and a committee of influential persons, for the purpose of securing to Richard Cort and his two surviving sisters, all now between 70 and 80 years of age, some recognition of their claims on the national wealth created by the inventions of their father. The disinterested spirit of generosity and sympathy with which

this movement has been undertaken can hardly fail to meet with a response, and to secure at least some acknowledgement of what the nation owes to the father by a suitable provision for the only three survivors of the name of Cort.*

TELEGRAPHS FOR TARGETS.

THE following will, we believe, prove a very useful suggestion:—

GENTLEMEN,—Rifle targets and "butts" are being constructed in great numbers in all parts of the country. It occurs to me that the employment of an electric telegraph to notify the position of each shot would save much time, trouble, and expense, as a substitute for the plan of bugle signals or other modes.

A double wire telegraph laid from the shooting house to the target-man's pit (in front of the targets) would be a small proportionate addition to the expense of a practise ground, and would add much to its completeness and safety.

The ground prepared for the corps to which I belong, "The London Scottish Volunteers," at the Crystal Palace will cost about £500. The plan I suggest is as follows:—A dial and pointer and a bell are to be fixed at each end of the wires, that is, at the shooting house, and in the target-man's pit. When a ball strikes he will with his left hand move a handle that turns the pointer on each dial to the exact direction of the hit on the target, that is above, below, right or left, or in the intermediate positions.

With his right hand he will then sound the bell (at the shooting house) by the electric current one, two, three, or four times, as the shot is in the outer, the inner, the third ring, or bull's eye, so as to tell the value of the shot. Yours, &c.

ROB ROY, the Bugler.

Patents for Inventions.

PROVISIONAL PROTECTIONS.

Dated Oct. 31, 1859.

2478. I. Brown. Improvements in the treatment of growing crops.

2482. A. Chevrier. Neutralising the smell and savour of all vegetable and animal substances without their being adulterated by the use of essence of spirits and aromatical products.

Dated Nov. 8, 1859.

2538. A. Leach. An improved process of manufacturing embossed sheet or stuffs, called embossed fictitious leather for hangings and household furnitures. (A communication.)

Dated Nov. 14, 1859.

2583. H. J. Daniell. Improvements in the construction of breech-loading fire-arms.

Dated Nov. 19, 1859.

2622. C. Bosc. The manufacture of artificial marbles.

2626. J. Hollingsworth. Improvements in the mode of and machinery for cutting irregular and other forms. (Partly a communication.)

Dated Nov. 23, 1859.

2648. W. H. Ward. Improved signal lanterns.

Dated Nov. 25, 1859.

2666. W. Smith. Improvements in applying and working propellers in boats and vessels. (A communication.)

Dated Nov. 30, 1859.

2706. B. Samuelson and W. Manwaring. Improvements in reaping and mowing machines.

2708. E. Dorsett. A new manufacture of heavy oil.

2710. H. de Matthys. Improvements in electric telegraph cables.

2712. W. E. Newton. Improvements in the construction of pianofortes. (A communication.)

2714. J. Lawson and S. Cotton. Improvements in machinery for cutting and forming the teeth or cogs of wheels.

* The Committee, of which William Fairbairn is the Chairman, consists of the Mayor of Manchester (Ivie Mackie), Thomas Basley, M.P., James A. Turner, M.P., Richard Cobden, M.P., Messrs. Whitworth, Hick, Penn, Boyd, and Webster, are soliciting subscriptions with the view of purchasing annuities for, or otherwise securing the comfort of the declining years of the survivors of the "Cort Family." Mr. David Morris, 1 Market-street, Manchester, acts as Secretary.

Dated Dec. 1, 1859.

2716. G. K. Geyelin. Making close folding metallic spring laths, mattresses, and bedsteads.

2718. A. Mosselman. An aromal electrical girdle.

2720. J. Cocks. Improvements in the mode of manufacturing cloths or materials for trowserings.

2722. W. E. Newton. Improved apparatus applicable for beating eggs, or mixing substances or liquids. (A communication.)

2724. G. Davidson. Improvements in the manufacture of paper bags, and in the machinery or apparatus used therein.

2726. N. S. Dodge. Improvements in the construction of lamps. (A communication.)

Dated Dec. 2, 1859.

2728. J. Moore. An improved damper of chimneys and flues.

2730. D. Makinson and J. Hope. Certain improvements in carding engines.

2732. W. H. Aldridge. Certain improvements in paddle wheels or propellers of steam ships.

2734. A. V. Newton. An improved mode of treating india-rubber, gutta percha, and analogous gums. (A communication.)

Dated Dec. 3, 1859.

2736. T. Hall. Certain improvements in the construction of cartridges.

2738. F. Palling. Improvements in the construction of lamps for burning oils and tallow.

2742. P. M. Parsons. Improvements in fire-arms and projectiles.

2744. J. Rudkin. Improvements in stoppers for bottles.

Dated Dec. 5, 1859.

2748. J. Hawkins and C. Hawkins. Certain improvements in the construction of furnaces for consuming smoke, applicable to stationary and marine boilers, and other closed fire-places.

2752. G. Feldwick. An improvement in roller blinds.

2754. W. Hutton. Improvements in preventing the destruction of the timbers of piers, docks, and other structures by the action of sea-worms, or other marine animals.

Dated Dec. 6, 1859.

2758. C. Sells. Improvements in marine steam-engines for driving screw and other propellers.

2760. J. Jones and J. Hilton. Improvements in apparatus to be used in dyeing, dunging, soaping, and clearing fabrics.

2764. F. Potts. Improvements in the mode of manufacturing or finishing tubes for certain purposes.

Dated Dec. 7, 1859.

2765. F. Levick. A new or improved coke oven.

2767. J. Anderson. Improvements in obtaining motive power.

2768. T. Bradford. Certain improvements in machinery or apparatus for wringing and mangling textile fabrics.

2769. R. A. Brooman. Improvements in marine steam-engines for driving screw and other propellers, and in screw propellers. (A communication.)

2770. F. W. Schäfer. Improvements in cash, deed, jewel, and other boxes.

2771. R. H. Collyer. A chemical ink-pencil or composition applicable as an instrument or means for writing, drawing, and marking.

2772. M. Jacoby. Improvements in the manufacture of twist lace.

2773. T. B. Harding. Improvements in combs or hackles for combing, carding, or hackling flax, cotton, silk, or other fibrous materials (which are also applicable to raising the nap or pile of woollen or other cloths), and in the making of pins or teeth for such combs or hackles.

2775. C. C. S. de Changy. Improvements in the manufacture of bread, which improvements are also applicable in the preparation of dough or paste for other purposes.

2776. J. Mabbott. Improvements in wind-guards for chimneys.

2777. R. T. Pattison. Improvements in printing and dyeing certain woven fabrics and yarns.

Dated Dec. 8, 1859.

2778. W. Spence. Improvements in rotating harrows. (A communication.)

2779. J. G. N. Alleyne. Improvements in the manufacture of boilers, ships, tanks, and other hollow vessels of iron and steel.

2780. J. Arrowsmith. A new or improved method of constructing land batteries and gun boats.

2781. J. Arrowsmith. Improvements in the manufacture of beams or girders, and in machinery and furnaces used in the said manufacture.

2783. R. Gray and T. H. Scholfield. Improvements in flattening and tempering steel wire and sheet steel, and also in the tubes employed in the furnaces.

2781. T. Crook. Improvements in machinery or apparatus for making paper bags.
2785. W. Prosser and J. Hogg. An improved cooking apparatus particularly suitable for military purposes.

2786. J. Norris, jun., and T. Till. Improvements in machinery to be used in manufacturing horse-nails and other wrought nails.

2787. F. H. Elliott and C. A. Elliott. An improved method of preventing drawing boards and other flat wooden surfaces from warping or twisting, and of adding to the strength thereof.

2788. A. Rumpff. An improved fastening for portemonnaies, portfolios, bags, and other like articles. (A communication.)

2789. J. Macintosh. Improvements in the manufacture of waterproof and other fabrics, and of moulded or formed articles.

2790. J. Macintosh. Improvements in setting artificial teeth.

2791. J. Macintosh. Improvements in cartridges and projectiles.

Dated Dec. 9, 1859.

2792. W. Boaler. An improved compound for washing purposes.

2793. J. Lawson and W. Hago. Improvements in apparatus to be used in spinning or twisting.

2794. J. Spiller. Improvements in drying articles or bodies formed of plastic clay.

2795. J. Tenwick. Improvements in the construction of steering apparatus adapted for ships and such like navigable vessels.

2796. H. Hughes and J. Moore. Improvements in machinery for transferring and for transferring and engraving designs and figures on to cylindrical and flat surfaces.

2797. J. D. Dunncliff. An improvement in the manufacture of bonnet fronts and ruches.

2798. W. Betts. An improved manufacture of capsules.

2799. J. Thomson, R. Thomson, and H. Thomson. An improved agricultural implement.

Dated Dec. 10, 1859.

2800. R. Heilman. The preparation of a new colour, called Azaleine, and its application to dyeing and printing. (A communication.)

2801. F. C. Calvert and C. Lowe. Improvements in dyeing and printing certain yarns and fabrics.

2802. G. Davies. An improvement in tobacco pipes, mouthpieces, and cigar or cigarette holders. (A communication.)

2803. W. Horton. An improvement or improvements in steam-boilers.

2804. C. Gammon. An improved fastener for gloves and other articles.

2805. J. Farquhar. Improvements in gas-meters.

2806. W. Whiteley. Improvements in looms for weaving.

2807. J. Chatterton. Improvements in the manufacture of projectiles.

2808. I. L. Bell. Improvements in the manufacture of the sulphate of magnesia.

2809. J. Chatterton and W. Smith. Improvements in insulating telegraphic conductors, and in the treatment of gutta serena.

2810. S. W. Campain. Improved machinery for removing or elevating straw and other agricultural produce.

2811. W. W. Bonnin and F. Pons. A new system and improvements in locomotive engines.

2812. D. Strickland. An apparatus for separating, sifting, sorting, and cleansing mineral ores.

Dated Dec. 12, 1859.

2813. R. Emery. Improvements in carriages for common roads.

2814. J. R. Breckon and R. Dixon. Improvements in the construction of coke ovens.

2815. P. G. Gennarich. A new system of motive power, applicable for working cranes and wheels.

2816. T. Stather. Improvements in the ventilation of buildings, ships, and enclosed places.

2817. P. Stirling. Improvements in traction engines.

2818. G. C. Watson. Novel and artistic bricks or "lumps" for the reception, growth, and propagation of ferns, mosses, and other plants.

2819. G. Lough. An improved compound motive power engine.

2820. G. H. Bollet. An improved machine for the manufacture of pressed bullets.

2821. W. Clay. An improved mode of manufacturing cannon and other ordnance.

2822. J. R. Isaac. Improvements in the construction of hand boxes for travellers.

2823. J. Bailey. Improvements in the manufacture of corsets and stays.

2824. W. Teall. Improvements in treating fatty and oily matters obtained from wash waters. (A communication.)

Dated Dec. 13, 1859.

2825. C. Vinall. Improvements in, and mechanism for, retaining the rollers of window blinds, maps, charts, and other articles requiring to be wound on rollers.

2826. T. Redwood. Improvements in the manufacture of paper and of substances used in paper making, and for other purposes.

2827. G. Withers. Certain improvements in blocks for moulding and shaping glass during the process of blowing or forming glass, for blowing sheet glass, glass shades, and such like articles.

2828. J. R. Johnson and J. S. Atkinson. Improvements in machinery for manufacturing printing types.

2829. W. Harding. Improvements in breech-loading fire-arms and in cartridge carriers.

2830. J. Barling. Improvements in propelling vessels.

2831. W. Robinson. Improvements in cask washing machines.

2832. J. M. Dickson. Improvements in the manufacture of yarns, and in the machinery to be employed in the preparation of certain fibres to be thus manufactured into yarns.

Dated Dec. 14, 1859.

2833. W. Clark. A heating apparatus for boots and shoes and other coverings for the feet. (A communication.)

2834. J. Champion. Certain improved arrangements of spindles, flyers, and bobbins, applicable to machinery or apparatus for preparing, spinning, and doubling fibrous materials.

2835. G. Leach. An improved mode of, and apparatus for, oiling, preparing, and mixing wool.

2836. R. Lawson. Certain improvements in machinery or apparatus for punching patterns or devices upon metallic printing rollers or cylinders.

2837. J. Rhodes. Improvements in steam hammers.

2838. W. Watson. An improvement in preparing indigo for dyeing and other purposes.

2839. W. R. Crocker. Improvements in cutting corks and bungs, and in apparatus employed therein.

Dated Dec. 15, 1859.

2840. B. Predavalle. Improvements in producing or obtaining motive power.

2841. W. Westwood. Improvements in the manufacture and burning of Portland cement.

2842. J. K. Hardy. Improvements in the manufacture of bottle stands.

COTTON SUPPLY ASSOCIATION.

TRIAL OF COTTON GINS.

IMPROVEMENT upon the INDIAN CHURKA.—All persons intending to submit gins for competition at the above trial, must forward them to the officers of this Association on or before the 19th day of July next, after which day no gin will be received.

The trial will take place on Tuesday, the 26th day of July. Further particulars may be obtained by application at the offices of the Cotton Supply Association.

G. B. HAYWOOD, Secretary.
1 Newall's Buildings, Manchester. (300)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE-WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

ENGINEERS' TOOLS FOR SALE.—A

Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 3 in. plates. Two Ditto for 3 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RATCHET BRACES, &c. Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (285)

PATENT LEVER BREAKS for RAIL-

WAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (273)

TO ENGINEERS, MACHINISTS, &c.—

To be DISPOSED OF, on very reasonable terms, a complete FACTORY, freehold, or can be rented. It is fitted with the best machinery, and has every convenience carrying on a large business. The connexion is small, but (with the interest of the proprietor) could be increased. Part of the money may remain on security. This will be found an excellent opportunity for a small capitalist. There is a good dwelling attached. Apply by letter to Mr. E. Ledger, Lewisham-road, Greenwich. (301)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c." (Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.

John Abbott and Co., Park Works, Gatehead, Durham.

J. and E. Lumsden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Milbank Forge, Hartlepool.

Henry Wood and Co., Gorée Piazzas, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wright and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcus, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire.

Darby.

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Gorée Piazzas, Liverpool.

JOHN TROTMAN, PATENTEE, 43 CORNHILL, LONDON. (249)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 168 Fleet-street. (250)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.

SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

HART & SON, MALLEABLE IRON. FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS

and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at 9 o'clock, and for the present at the BUILDERS' SALE GROUNDS, (established 1854,) 23 and 24, MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS.

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

137 HIGH HOLBORN, LONDON, W.C.
Agent at MANCHESTER—E. S. ROGERS, 23 Cannon Street. (281)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)

15 Wellington-street North, Strand, London, W.C. (270)

HORIZONTAL HIGH-PRESSURE

STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 30in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In

consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus:—SMITH, Patentee, 69 Princess-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING and SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

THORLEY'S FOOD FOR CATTLE.—Every

person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 48 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY, 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778).

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.

STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
RAWMING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Threshing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOK for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & Sons' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

JOHN HENDERSON PORTER,

ENGINEER AND CONTRACTOR,

PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,

IRON BUILDING AND ROOFING WORKS,

GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
Cast and Wrought Iron Columns, Stanchions, and Girders.
Ties, Straps, King-heads, Shoes, &c.
Iron Punt for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.
Iron Wheelbarrows, Cart Bodies, &c.
Hay Racks, Mangers, Sheep Cribbs, and Cattle Troughs.
Rick Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.

Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

WOOD ENGRAVING.

TO THOSE DESIRING ILLUSTRATED CATALOGUES OR CIRCULARS.

O. STEVENS,

10 GOUGH-SQUARE, FLEET-STREET,

Undertakes the preparation of Illustrated Catalogues and Circulars, for Engineers, Agricultural Implement Makers, Ironmongers, Birmingham and Sheffield Warehousemen, and others; and from considerable experience in illustrating mechanical journals, can ensure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Drawings on the Wood Blocks.

ESTIMATES FURNISHED.

ADDRESS,

C. STEVENS,

DRAUGHTSMAN & ENGRAVER ON WOOD,

10 GOUGH-SQUARE, FLEET-STREET. (286)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of Infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (238)

WATER GAUGES—WATER GAUGES.

Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

Willcox and Co., Millwall Pottery Company. These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 800 lb.

Extensively used on all the principal lines. To be had only of E. MOORE, 35 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

* Price List of Gauge Fittings, &c., on application. (291)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of
WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of
WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1, 2, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (244)

FUEL AND STEAM ECONOMY.

VENTILATION WITHOUT FLUES. KUKLA'S PATENT STOVES,

At 18s., 35s., and 50s.

KUKLA'S newly-invented Deflagrator—the first and only perfect GAS STOVE. Guaranteed to burn without flue—without dust, smell, or smoke, producing a great and pure heat with the least expenditure of Gas.—*Fide Society of Arts' Journal.*
Patronised by the English and French Government.

Scientific in Principle,
Simple in Construction,
Healthy and efficient in use.

The Deflagrator Stove is cheap, portable, and suited for every situation; and from the principle on which it is constructed (viz., expanding to a sixfold volume the gas used) is capable of warming any given space more quickly and more thoroughly than any other means: while its addition forms a sure remedy for any ill-warmed or ill-ventilated apartments.

The 25s. Deflagrator warms a room of 2,000 cubic feet at a cost of 3d. per day.

The 50s. Deflagrator warms 5 to 6,000 cubic feet at a cost of 6d. per day (twelve hours). Also, the Greenhouse Stove at 18s.

Patentee and sole Manufacturer, F. X. KUKLA, 194 Pentonville-road, London.

Country orders promptly attended to. Carriage free to any Railway in London.

Post-office Orders should be made payable to FRANCIS XAVIER KUKLA, General Office.

N.B.—Every Stove separately tested before sent out.

The New Gas Cooking Stoves for 10 persons, price £3.

TRACTION ENGINES, (BOYDELL'S PATENT.)

MANUFACTURED BY CHARLES BURRELL,

St. Nicholas Works, Thetford, Norfolk.

And ordered for India, Australia, and South America, may now be seen, complete and in course of construction at the above works. BOYDELL'S TRACTION ENGINES AND ENDLESS RAILWAY will draw heavier loads over good roads than any other traction engine, and on soft and bad roads will draw heavy loads where no other traction engine can move itself. All objection to the wear and tear of these Engines is entirely removed by the use of Charles Burrell's improved patent Wrought Iron Wheels, fitted with Rails and Tyre, as well as all the wearing parts, of Steel.

Apply also to Mr. Hemming, Mark Lane, E.C.

THE PATENT PLUM-
BAGO CRUCIBLE COMPANY
 having completed the enlargement
 of their premises, beg to call the
 attention of all users and shippers
 of Melting Pots to the great superi-
 ority of the PATENT CRUCI-
 BLES, which have been used dur-
 ing the last three years by some
 of the largest melters in England
 and abroad. In addition to their
 capabilities of melting an average
 of from thirty-five to forty pour-
 ings, they are unaffected by change
 of temperature, never crack, but
 can be used till worn out, requiring only one anneal-
 ing for several days' work, and become heated much
 more rapidly than ordinary pots, effecting thereby
 a saving of more than fifty per cent. in time, labour, fuel,
 and waste. The Patent Plumbago Crucible Company also
 manufacture and import clay crucibles, muffles, portable
 furnaces, sublimate pans and covers, glass-pots, all descrip-
 tions of fire-standing goods, and every requisite for the
 assayer and dentist. For Lists, Testimonials, &c., apply

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to
 state that the increasing demand for the Gutta Percha
 Strapping for Driving-bands, Lathe-straps, &c., fully
 justifies the strong recommendations they have everywhere
 received.

Their durability and strength—permanent contractability
 and uniformity of substance—their non-susceptibility to
 injury from contact with oils, grease, acids, alkalis, or
 water—and the facility with which the only joint required
 can be made in bands of from 200 to 300 feet long—render
 them superior to leather for almost all working purposes,
 and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery,
 London.

"In reply to your inquiry, we have much pleasure in
 bearing our testimony to the advantages, both as regards
 economy and saving of time, effected by the use of your
 Patent Gutta Percha Bands in lieu of Leather Straps. The
 stoppage of one portion of our works through the failing of
 the leather strap used to be of daily occurrence—but with
 this annoyance we are now never troubled. We have had
 these straps in operation for nearly three years, and are
 assured by our Engineer that they effect a saving to us of
 at least thirty pounds a year."

From JAMES ABERNETHY & Co., Fary Hill Foundry
 Aberdeen.

"We have now had Gutta Percha Bands working here
 for three years. One of them has been driving the fan
 blast for our smith's shop for all that time, and for any-
 thing we see, may drive it as long again. The speed of
 the fan is but 1,200 per minute. We have used them with
 complete satisfaction, driving circular saws, and in some
 cases where leather bands would have been quite inappli-
 cable from damp. We have uniformly endeavoured to
 have the drums and pulleys so proportioned to the strain,
 so that there is no chance of the band slipping; and with
 this precaution, and taking care in using cross bands that
 they do not rub, we are quite satisfied that they are
 superior in every respect to leather—stronger at the same
 weight, and keeping quite straight in working—requiring
 no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of
 a leaden pipe, which was employed for a short time in
 conveying water from a well on the grounds of Mr. Dick,
 of Donchurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the
 following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious
 or destructive to the health of the community than the use
 of leaden pipes for the conveyance of water. The poisonous
 salts of lead thereby communicated are most insidious and
 subtle. I hail with gratitude the substitution of Gutta
 Percha Tubing. I have had the leaden pipe of my own
 house removed, and its place supplied with one of Gutta
 Percha Tubing. Nothing can be better. I have also recom-
 mended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill
 Bands, Tubing, Sheet, Soles, Pump Buckets,
 Bosses, Union Joints, Bottles, Bowls, Flasks,
 Curtain and Cornice Rings, Solid Frames, Gal-
 vanic Batteries, &c., &c.

THE ATLANTIC TELEGRAPH COMPANY.—(Incorporated by Special Acts of Parliament, whereby the liability of each Shareholder is strictly limited to the amount individually subscribed for by him.) Five Pound Shares. Issue of Preferential Shares. Guaranteed 8 per Cent. by Her Majesty's Government on the conditions herein specified. Fixed income on the Cable when in work from the Governments of Great Britain and the United States, £34,000 per annum, irrespective of mercantile and other messages. Special advantageous Traffic arrangement with the entire Telegraphic System in America.

£300,000 in Guaranteed Preferential Shares of £5 per Share. 10s. per Share payable on application, and a further sum of £2 per share on allotment.

DIRECTORS.

CHAIRMAN—The Right Hon. JAMES STUART WORTLEY, Upper Sheen House, Mortlake.
VICE-CHAIRMAN—C. M. LAMSON, 64 Queen-street, Cheap-side, London.
Samuel Gurney, M.P., 65 Lombard-street, London.
Francis Le Breton, 3 Crosby-square, London.
J. W. Brett, 2 Hanover-square, London.

Robert Dalglish, M.P., Glasgow.
Capt. A. T. Hamilton, 12 Bolton-row, Piccadilly.
George Peabody, 22 Old Broad-street, London.
John Pender, Mount-street, Manchester.

SECRETARY—George Seward.
BANKERS—The Bank of England.
SOLICITORS—Freshfield and Newman.

Communication by Electric Telegraph between Great Britain and America is no longer a theoretical proposition, but an accomplished fact.

The development of this enterprise—one of the greatest of modern times—is entirely due to the Atlantic Telegraph Company.

In consequence, however, of the accidents and injuries to which the first Cable was subjected before its final and successful submergence, a considerable loss, and still greater disappointment, have resulted to the original Shareholders; but the Directors are sanguine as to the permanent success which awaits their future exertions.

The Subscribers to the Preferential Capital now about to be issued will not be affected by the losses of the first proprietors.

The Preferential Capital will consist of 120,000 Shares of £5 per share.

It is proposed to call up 50 per cent. of this amount, viz., 10s. per Share to accompany the application for the Shares, and a further sum of £2 per Share on allotment.

These Shares will have all the privileges of guaranteed Preferential Shares in the Atlantic Telegraph Company, under the following resolution of the Extraordinary General Shareholders' Meeting of June 8, 1859.

Resolved—"That the said Capital of £600,000, or so much thereof as may from time to time be issued shall be and is hereby constituted Preferential Capital of the Atlantic Telegraph Company, and the Shares therein shall be entitled to receive upon the amounts from time to time paid up, a Dividend of 8 per cent. per annum, payable half-yearly, out of the balance of profit in each half-year.

"That after 8 per cent. shall have been paid on such Preferential Shares, all the old capital of the Company shall next become entitled to a dividend of 4 per cent.
"That after such 8 and 4 per cent. shall have been respectively provided for, the whole capital of the Company shall participate equally, pro rata, in any additional profits."

The dividend on the Preferential Shares is ensured by the guarantee of the British Government of 8 per cent. per annum for twenty-five years on all amounts called up and employed not exceeding £600,000, the conditions being that the Cable shall be laid and work successfully.

In case of temporary suspension of working, from injury to the Cable or other causes, the Government will allow a liberal time for its restoration, during which time they will continue their guarantee.

The dividend during the time the Cable is successfully at work is further secured by subsidies amounting to £20,000 a-year from Her Majesty's Government, and 70,000 dollars or more than £14,000 a-year from the Government of the United States.

The Company's minimum secured or absolute revenue, therefore, without taking into account the great receipts that may be expected from commercial and other messages, will be £34,000 a-year, commencing from the day when the Cable is successfully laid.

The connexion which has already been established between this Company and the New York, Newfoundland, and London Telegraph Company secures a full participation in the valuable privileges and traffic arrangements possessed by them over all the telegraphic systems in British North America and in the United States.

In addition to the fixed annual subsidies already spoken of, the Atlantic Telegraph Company will, by means of this connexion, enjoy special advantages with reference to reductions in Tariff, and special facilities for the transmission of "through" passages over the whole Continent of America, enabling them to serve the public in a manner that cannot be competed with, and at a profit to themselves which could not be attained by any other Company.

The construction of the next and future Cables will, in many essential particulars, differ from that of the first.

The experience now possessed by the Company of the course along which the Cable has been laid, and which is the only line across the Atlantic Ocean hitherto demonstrated to be practicable for submerging a Telegraph Cable, is of the greatest value.

The further experience of this Company in the electrical and other phenomena developed by them on the longest of

all Telegraphic Cables, will, it is believed, result in the working of messages at twice the rate that has lately been expected from an Atlantic Cable.

The Directors will enter into no engagement or contract without seeking the mature advice of the highest scientific and practical authorities in this country and in America, with whom they are in treaty, and whose names will shortly be published. This will enable them to decide with confidence upon the external form and construction of the Cable, its specific gravity, its insulation, and the size of its conductor.

The Directors are fully alive to the importance of a prudent economy, and it is expected that a sum far less than that which power has been taken to raise will be ample to cover the manufacture, insurance, and submersion of the Cable; but the first object of the Directors will be to secure the most perfect and the best manufactured Cable that can be constructed.

Proposals have already been received from respectable contractors, which, if accepted, will ensure the manufacture of the new Cable at the smallest cost consistent with efficiency and durability. These offers are such as would ensure, under the protection of effective penalties, its careful submergence and its efficient working for one month.

As a further precaution, the Directors contemplate being able to take out a policy of insurance to cover the risk of the successful submersion of the Cable from shore to shore.

The earliest operations entered into will be directed to an endeavour to resuscitate or raise the old Cable, for which purpose the Directors have obtained permission from the Government to employ, in the first instance, a sum not exceeding £30,000 out of the new guaranteed capital. If successful in these endeavours, the British Government consent to commence at once to pay £14,000 a-year, which they will increase to £20,000 when a new Cable is laid, whether the effort to resuscitate the old Cable be successful or not. The subsidy of 70,000 dollars per annum from the United States Government will also commence at once if the attempts to restore the old Cable are successful.

The Directors will not commence any works nor conclude any contracts till the amount of new 8 per cent. Preferential Stock subscribed for reaches £300,000; and they undertake that, if the subscriptions do not amount to that sum at least, they will return to the Subscribers the deposit advanced by them, deducting only the trifling sum per Share incurred in the preliminary expenses attendant on the issue of this new capital, and any portion of the £20,000 which may have been expended in attempting to raise or resuscitate the old Cable which shall not be balanced by the value of the Cable so recovered.

It is believed by the Directors that, under the foregoing proposed arrangements, a very promising investment is offered to the original Shareholders and to the public, and that the accomplishment of the great work is thereby rendered to a large extent secure and certain.

Applications for Shares will be received in the form set forth below, addressed to the Secretary of the Company, at the offices, 22 Old Broad-street, E.C., London; the first deposit of 10s. per Share being at the same time remitted to either of the undermentioned bankers. This amount will be returned in full, if the shares are not allotted.

By order,
GEORGE SEWARD, Secretary.

22 Old Broad-street, London, 1859.

SUMMARY OF PROSPECTUS.

1. Total issue, £600,000 in Shares of £5 each.
2. Guarantee of 8 per cent. per annum from the British Government, to commence on the opening of the Cable to the public.
3. After the 8 per cent. is paid to the Preference Shares, and 4 per cent. on the old capital, the Preference Shares are to divide the balance of profit, pro rata, with the old capital.
4. Subsidy of £20,000 per annum from the British Government.
5. Subsidy of 70,000 dol., or more than £14,000 per annum, from the United States Government.
6. Security, under a special contemplated policy of insurance, against the entire or partial loss of the Cable during submersion.
7. Offer of contractors to make, and lay down, and work the Cable successfully.
8. Advantageous agreement with the New York, Newfoundland, and London Telegraph Company, whereby special facilities for traffic are secured over all the telegraphic systems in America, and reductions of tariff over many of them.
9. Return of deposits to subscribers if the capital subscribed is inefficient.

BANKERS (who will receive deposits).
LONDON—London and Westminster Bank.
LIVERPOOL—Bank of Liverpool.
MANCHESTER—Union Bank.
GLASGOW—Union Bank of Scotland.

APPLICATION FOR SHARES IN THE PREFERENTIAL CAPITAL OF THE ATLANTIC TELEGRAPH COMPANY.

Five Pound Shares.—8 Per Cent. Guaranteed.

To the Directors of the Atlantic Telegraph Company.
Gentlemen,—Having this day paid to the Company's Bankers the sum of £ , being 10s. per Share now applied for, I request you to allot me Shares of Five Pounds each in the Guaranteed Preferential Capital of the Atlantic Telegraph Company on the conditions stated in the prospectus; and I hereby undertake to pay the further deposit of £2 per share thereon immediately on allotment, and the future calls as and when they are made by the Directors. It being understood that no further calls are to be made until the minimum amount of £300,000 has been subscribed for, and that the deposit (less the propor-

tion of expenses thereon, according to the conditions of the Prospectus) shall be returned to me in case the said amount is not subscribed for.

Price Lists post free on application.—JAMES LYNE HANCOCK, Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (257)

RANSOME'S PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c. —By this process the softest and most friable Stone, Cement, or Stucco, can be rendered Impervious and Imperishable, DECAY AT ONCE ARRESTED AND PREVENTED.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (175)

BY HER MAJESTY'S ROYAL LETTERS PATENT. PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM,
Engineers and Iron Founders, North Hants Iron Works, Basingstoke. (121)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address, GEORGE RICHARDSON and CO.,
1 New Broad-street, E.C. (277)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

PUMPING MACHINERY.

GWYNNE AND Co., Engineers, London, manufacture and supply the following Machinery, of the most approved construction and with all the latest improvements:—Portable and Fixed Steam-Engines and Boilers of every description; Waterwheels, Windmills, Horse and Hand-power Machines; Pumping Machinery for the Supply of Towns, Cities, and Districts, and for the Irrigation of Coffee, Cotton, Indigo, Sugar-cane, and Rice Estates, for pumping out Cofferdams, Canals, Dry Docks, Reservoirs, &c. They also manufacture and supply the Pumping and other Machinery for Paper, Pulp, and Filling Mills, Breweries, Distilleries, Tanneries, Starch Works, Bleaching, Dyeing, and Calico Printing Works, Chemical Works, Silk, Cotton, and Flax Mills, and Manufactories in general. All Letters not paid will be refused. Illustrated Price Lists forwarded on receipt of Six Postage Stamps.—GWYNNE AND Co., Hydraulic and Mechanical Engineers, Essex-wharf, Strand, London.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (21)

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,

to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description are supplied by us on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so.

T. SUFFIELD AND CO.

Also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of such Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S. E.

LONDON.

(16)

MEDALS AWARDED TO THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:
GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER's Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER.
PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (203)

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invites the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTRES, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batswings, &c.;
IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS,
AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—80s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s. (204)

THE IMPERIAL IRON TUBE COMPANY, (SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,
BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND
LAP-WELDED IRON BOILER TUBES. (193)

**TO STEAM SHIP OWNERS, ENGINEERS, AND
OTHERS.**

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED. (80)

VINEGAR.—Patronised by Her Majesty's Government.

**CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.**

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—83 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars'-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 30 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Dock Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTORS
and ENGINEERS.

2 John-Street, Minorics, London, E.C.
Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (190)

Chairs, Spikes, Bolts, and General Railway Fittings. (279)

FOWLER'S PATENT STEAM PLOUGH.

CUT OF FOWLER'S ENGINE, WINDLASS, AND WATER-CART.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

FOR FURTHER PARTICULARS, ILLUSTRATED CATALOGUES AND PRICES, APPLY TO
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from
PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND
SCOTT'S PATENT CARROT SEED BEARDING
 AND
CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square, London, N.W. (48)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by Farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER AND OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (215)

A VALUABLE PATENT to be DISPOSED OF.—The Patentee will either dispose of the Patent or grant Licences to any party wishing to manufacture, or would join a person with capital to carry out the Patent. Address, A. Z., MECHANICS' MAGAZINE Office, 166 Fleet-street. (163)

METROPOLITAN BOARD OF WORKS.
MAIN DRAINAGE of the METROPOLIS.—SOUTHERN HIGH LEVEL SEWER.—To BUILDERS, CONTRACTORS, and Others.—The Metropolitan Board of Works hereby give notice, that they will MEET at the Council Chamber, Guildhall, in the City of London, on Friday, the 22nd day of July inst., at Twelve o'clock at noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of MAIN BRICK SEWERS, Nine Miles 2,940 Feet in length, or thereabouts, and for the execution of other works in connection therewith, to extend from Deptford Creek to High-street, Clapham. Also, a Branch to extend from the Broadway, Deptford, to the point of junction with the Effra Sewer, in Croxted-lane, Dulwich; and for the maintenance of such works in complete repair for twelve calendar months.
Parties desiring to submit Tenders may, upon payment of 25, obtain plans, sections, specification, form of tender, and other particulars, on application at the Office of the Board, between the hours of Nine a.m. and Four p.m.
Tenders addressed to the Metropolitan Board of Works, must be delivered at the Office of the Board, No. 1 Greek-street, Soho, before Four o'clock p.m., on Thursday, the 21st day of July inst., and no Tender will be received after that hour.
The Board do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two approved sureties for the due performance of the work.
E. H. WOOLRYCH, Clerk of the Board.
No. 1 Greek-street, Soho, July 2, 1859. (305)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.
THE ANCHOR COMMITTEE AFFIRM
"TROTMAN'S PATENT ANCHOR"
to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.
"This appeared to the Committee of vast importance to the Shipping Interests, &c."
(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE
Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.
Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.
Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.
Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

PATENTEE, 43 CORNHILL, LONDON. (249)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (250)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS
and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.
SPENCER, READ, & Co., 4 Agst-street, Strand, W.C. (90)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

TO INVENTORS.

INDIA-RUBBER APPARATUS
OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

INVENTORS, ENGINEERS, AND OTHERS.
An Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.
Address, M. E., 9 Parliament-street, Westminster. (304)

FOR SALE.
TWO SELF-ACTING PLANING MACHINES, nearly new; two feet stroke, working on excentric wheels, with Top Driving Apparatus. Also, some 2½ inch Shafting, Binding, &c.
Address, SCHAU and GODFREY,
129 Great Charles-street, Birmingham. (306)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS
and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New), beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS,
OIL MERCHANTS,
Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.
127 HIGH HOLBORN, LONDON, W.C.
Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.
The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

ENGINEERS' TOOLS FOR SALE.—A
Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for ½ in. plates. Two Ditto for ¾ in. plates, and Two Ditto for 1 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RATCHET BRACES, &c.
Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (285)

NORTON'S GOSSAMER CARTRIDGES,
FOR MILITARY FIRE-ARMS.
These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street. (286)

JOHN HENDERSON PORTER,
ENGINEER AND CONTRACTOR,
 PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,

IRON BUILDING AND ROOFING WORKS,
 GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
 Cast and Wrought Iron Columns, Stanchions, and Girders.
 Ties, Straps, King-heads, Shoes, &c.
 Iron Panks for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.
 Iron Wheelbarrows, Cart Bodies, &c.
 Hay Racks, Manglers, Sheep Cribes, and Cattle Troughs.
 Risk Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.

Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

CLAYTON, SHUTTLEWORTH, AND CO.,
 OF LINCOLN,
 78 LOMBARD STREET, LONDON, E.C.,
 AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
 And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s **PORTABLE STEAM ENGINES** are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important *reduction in prices* made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from
PERENNIAL AND ITALIAN RYE-GRASS, &c.,
 AND
SCOTT'S PATENT CARROT SEED BEARDING
 AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
 which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admitted the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square, London, N.W. (48)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their **PATENT STEAM WINDING ENGINES AND PLOUGHS**, for Cultivating Land by Steam.

The **WINDING TACKLE** can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Threshing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER AND OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
 Or **Mr. OLIVER, Farmer, Hatfield, Herts.**

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (215)

WOOD ENGRAVING.

TO THOSE DESIRING ILLUSTRATED CATALOGUES OR CIRCULARS.

C. STEVENS,

10 GOUGH-SQUARE, FLEET-STREET,

Undertakes the preparation of Illustrated Catalogues and Circulars, for Engineers, Agricultural Implement Makers, Ironmongers, Birmingham and Sheffield Warehousemen, and others; and from considerable experience in illustrating mechanical journals, can ensure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Drawings on the Wood Blocks.

ESTIMATES FURNISHED.

ADDRESS,

C. STEVENS;

DRAUGHTSMAN & ENGRAVER ON WOOD,
 10 GOUGH-SQUARE, FLEET-STREET. (268)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved **EQUILIBRUM WATER COCK** or **VALVE**, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 106 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
 (LIMITED) has **RAILWAY WAGGONS FOR HIRE.**
 Apply to the Secretary, 3 Newhall-street, Birmingham. (376)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorises but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (238)

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. (264)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of
WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of
WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1, 2, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (344)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (343)

RICHARD BAIRD, GENERAL COMMISSION AGENT, AND CONTRACTOR for all descriptions of **RAILWAY PLANT AND STORES.**
 13 DOCK-STREET, DUNDEE. (360)

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelty in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery. •

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us on order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description are supplied by us on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so.

T. SUFFIELD AND CO.

Also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving the cost of such Articles.

"MECHANICS' MAGAZINE" & PATENT OFFICE

166 FLEET STREET, LONDON, E.C. (16)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonechurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor.*

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter;

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of *leaden pipes* for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

NOTICES.

The **MECHANICS' MAGAZINE** will be sent free by post to all subscribers of £1 ls. 6d., annually, payable in advance. Post Office Orders to be made payable to R. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

The demand for Mr. E. J. REED'S paper—

ON THE MODIFICATIONS WHICH THE SHIPS OF THE ROYAL NAVY HAVE UNDERGONE DURING THE PRESENT CENTURY, IN RESPECT OF DIMENSIONS, FORM, MEANS OF PROPULSION, AND POWER OF ATTACK AND DEFENCE."

has been so great that the Journal of the Society of Arts, the **MECHANICS' MAGAZINE**, and all other Scientific Journals in which it appeared in December last, are now out of print. The demand still continuing, it has been deemed desirable to reprint it in a separate form. An 8vo. edition of it, in large type, and on fine paper, has, therefore, been prepared, and may now be had at the Office of this Magazine, price 1s.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

CHURCH WORKS, Knowle, Warwickshire.—Erection of vestry and resecting parish church. Plans, &c., at the vestry. A day fixed on application to Mr. J. Nevill, architect, Coventry, from whom further information. Tenders to the Churchwarden before noon, July 25.

STONE, Margate.—For the supply of 80 to 100 tons of the best blue Guernsey granite broken to a two-inch ring, sifted free from small and dust, and delivered over the ship's side in the harbour before the end of October next. Tenders to the town clerk before July 18.

DESIGNS FOR CEMETERY, Barnsley.—Two chapels and entrance lodge. Area, 13 acres. Expense of erections and laying-out not to exceed £4,000. £30 for the best, and £10 for the next best designs. Tenders to the Board, July 23.

CRURCH, Medstead.—For additions. Plans at the Parsonage. No date given.

ABLUTION ROOM, &c., Great Yarmouth.—With washhouse, &c., at the temporary barracks. Drawings and forms of tender at the engineer's office, Great Yarmouth, up to Wednesday, July 13. Tenders, July 16, to the directors of contracts, War Office, Pall-Mall.

ENLARGEMENT AND RESTORATION, Merion Pinkney, Northamptonshire.—To the Manor House, plans, &c., Mr. E. F. Law, architect, Northampton. Tenders, July 16.

SIX LABOURERS' COTTAGES, Devon.—Parish of Coryton, near Tavistock, to contain kitchen, office, and three bedrooms. Particulars and plans, Mr. Mielchmore, Manor Cottage. Tenders, July 18.

COALS, Bridgell and Bethlem Hospitals.—800 tons of Lambton or Hettons Wall, and 200 tons of Llangemick Welsh coals, to be delivered before the 30th September. Tenders to clerk's office, Bridgell Hospital, New Bridge-street, Blackfriars, July 9.

STONE, Warrington.—1,500 tons of broken stone for the repairs of streets. To pass through a two-inch ring, and delivered at the Bank Quay. Further particulars of the Bow engineer, to whom tenders and samples, July 16.

GRANITE, Trow.—For pavements. To be from 3 feet to 6 feet long, and 6 inches thick, at per foot super. For kerbs, 1 foot square, at per foot run. For gutters, 1 foot 4 inches wide, pink 10 inches wide 8 inches deep, at per foot run. Tenders, July 18.

SCHOOLROOMS AND RESIDENCES, Bloxwich.—Three schoolrooms and two residences, at Bloxwich, near Walsall. Plans and all necessary information Mr. J. Cranston, architect, 2 Bennett's Hill, Birmingham. Tenders to Charles Somerville, Esq., Bloxwich, July 21.

FURNISHING THE WESTMINSTER PALACE HOTEL.—In all its departments. Forms of specification and tender, the secretary, 5 Parliament Street. Tenders July 18. Seventy-five per cent. to be paid in cash on delivery and approval, the rest on completion of the work.

HEAD-FOREMAN.—Marine-engine manufactory, to take charge of all except foundry and boiler and smiths' shops. Apply by letter to "P. Gateshead."

PURSER, Great Eastern.—Applications for the appointment of purser to the steam-ship Great Eastern, to be sent to the company. Temporary offices, 79 Lombard-street, July 16.

FOREMAN.—Not more than 40 years of age, having already filled the position of foreman of smiths and fitters. One accustomed to the manufacture of iron roofs and bridges, preferred. Address, K., 36 Journal office, Birmingham.

GUNMAKERS.—For the Military Trade. Stokers, screwers together, and finishers. Apply to 73 Legge-street, Birmingham.

IRON BRASSERS.—Six men. Constant employment. Mr. Wm. Bishton, Falkland-street, Wolverhampton.

THE GENERAL PATENT COMPANY, LIMITED.—Capital, £50,000, in 5,000 Shares of £10 each. Calls not to exceed £2 10s. per Share for the first year, and no subsequent call to be made without two months' notice. Deposit, 5s. per Share.

PATRONS. Wm. FAIRBAIRN, Esq., C.E., F.R.S., F.G.S., &c., &c., The Polygon, Manchester.

F. S. POWELL, Esq., M.P., Horton Hall, Bradford, and 45 Gloucester Terrace, W.

DIRECTORS. Col. C. G. FAGAN, H.E.I.C.S., (Director of Malta Telegraph Company) 20 St. Petersburg-place, Bayswater, W.

MARTIN JOSEPH ROUTH, Esq., M.A., Hampton, Middlesex.

WILLIAM FARRINGTON, Esq., Wood Vale, Isle of Wight.

BANISTER FLETCHER, Esq., Oregon-terrace, Peckham Rye.

EDWARD ROBINSON, Esq., Blenheim-place, St. John's Wood.

BANKERS. Messrs. BARCLAY, BEVAN, and Co., Lombard-street, London

SECRETARY. C. W. ORFORD, Esq., C. and M.E.

TEMPORARY OFFICES. 12 Pancras-lane, Chesham, E.C., London.

The Company has been formed for the purpose of assisting inventors, and its contemplated operations comprise—

The taking out of Patents and Registrations for Inventors, and when required, advancing the money for this purpose.

The advancing sums of Money on approved security to Inventors and Patentees, for the purpose of enabling them to develop and complete their Patents and Inventions.

The Purchase and Sale of Inventions and Patents. The Selling of Patents and Inventions on Commission.

The investigation of the value and merits of Inventions, and the granting of Certificates thereof.

The devotion of a portion of the Company's Premises for the purpose of receiving Models and Drawings of Inventions and Patents.

The keeping a Registry of all Patents taken out by the Company, and the furnishing a Monthly List thereof to all Subscribers.

All information may be obtained at the Office, and the Deposit may be remitted to the Bankers or to the Secretary. (223)

MR. WALTER HALL is prepared to Grant Licences, or to Dispose of his Patent for working Railway Breaks. Particulars to be had of Mr. HALL, who may be addressed by letter to the care of the **MECHANICS' MAGAZINE**, 166 Fleet-street, E.C. (217)

RAILWAY SLEEPERS, &c.

WE are prepared to sell, by Private Contract, about 100,000 Scotch Fir Sleepers, of the various dimensions in use.

Also, any quantity of Larch, and Scotch Fir Poles, Planks, Deals, Staves, and Pitwood.

Early applications will meet the best attention of

REID and FORBES, 45 High-street, Inverness, N.B. (282)

BY HER MAJESTY'S ROYAL LETTERS PATENT. PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM, Engineers and Iron Founders, North Hants Iron Works, Basingstoke. (121)

LIST OF PRIZE SUBJECTS FOR SESSION 1859-60.

THE ROYAL SCOTTISH SOCIETY OF ARTS.

ARTS propose to award PRIZES of different values, of THIRTY SOVEREIGNS and under, in GOLD or SILVER MEDALS, SILVER PLATE, or MONEY, for approved Communications primarily submitted to the Society, relative to INVENTIONS, DISCOVERIES, and IMPROVEMENTS in the Mechanical and Chemical Arts in general, and in their relation to the Fine Arts, and also to means by which the Natural Productions of the Country may be made more available. The Society suggests the following as a few of the many subjects that may be attended to, viz.:

I. INVENTIONS, DISCOVERIES, or IMPROVEMENTS in the Useful Arts.

1. Mechanical Arts.

Inventions or Improvements in applying the Motive Power of Men and Animals,—in Wind and Water Prime Movers,—in Steam and other heat Engines and their various applications,—in Pumping, Blowing, Rolling, Sawing, Agricultural, and other Engines and Machines,—in Cotton and other Textile Manufacturing Mills,—in Shipbuilding, Wood, Iron, and Steel,—in Lighthouses,—in Marine Propellers,—in Railways, Plant, and Signals,—in Electro-Magnetic Motive Power,—in Electric and other Telegraphic Apparatus, Submarine and Aerial,—in Photographic Apparatus,—in Fire-Proof Buildings,—in Water Supply,—in Paving,—in Sewerage,—in Economical Appliances for increasing the Sanitary Condition of Towns,—in Smoke Consumption and Extinguishing Fires,—in Gas Works,—in Canals and Inland Navigation,—in Tools, Implements, and Apparatus for the various Trades,—in Bricks, Encaustic Tiles, Cements, and Mortars,—in Printing Machines, Cases, and Rollers,—in Stereotyping,—in Cranes,—in the Machinery for Collieries,—in preserving Timber and Metals in Marine Works,—in Optical Apparatus for Astronomy, Surveying, and Levelling,—in Manufacture of Paper, &c.

2. Chemical Arts.

INVENTIONS or IMPROVEMENTS in New and Useful Applications of Gutta Percha and Vulcanised India Rubber, or similar Gums,—in the Economical Extraction of Chemical Principles or Useful Substances, as Paraffine, &c., from Coal, Porcelain, Clay from Granite or Felspar, and Metals generally from their Ores and Oxides,—in Dyes, in Paints,—in Paper,—in Glass, especially for Lenses,—in methods of rendering the Electric Light available in practice; &c.

3. Relative to the Fine Arts.

INVENTIONS or IMPROVEMENTS in Photographic Processes, in "Carbon" Printing, and in Methods of Printing Photographs from their Impressions on Steel or Copper Plates, or Lithographic Stones,—in Electrotype Processes,—in Die-sinking,—in Methods of Illustrating Books, to be Printed with the Letterpress,—in Paper-Hangings, in Articles of Porcelain, Common Clay, or Metal,—in Glass-Staining, in Engraving on Stone,—in Chromo-Lithography,—in "Nature" Printing.

Discovery of Plumbago Mines,—of Slate Pencil of good quality,—Whetstones,—of Wood suitable for Engraving.

II. EXPERIMENTS applicable to the Useful Arts.

III. COMMUNICATIONS of Processes in the Useful Arts practised in this or other Countries, but not generally known.

IV. PRACTICAL DETAILS of Public or other Undertakings of National importance, already executed, but not previously published; or valuable Suggestions for originating such undertakings.

KEITH PRIZE, value Thirty Sovereigns.

For some important "Invention, Improvement, or Discovery, in the Useful Arts, which shall be primarily submitted to the Society" during the Session.

MAKDUGAL BRISBANE BIENNIAL PRIZE,

Value £10.

"To the Authors or Inventors of Communications of Merit, which shall be approved of by the Society, or its Committee, and judged by them deserving of such distinction."

REID AND AULD PRIZES.

For the First, Second, and Third best Models of "anything new in the Art of Clock or Watch Making, by Journeymen or Master Watch and Clock Makers," if these should be considered worthy of Prizes, the year's Interest of the Reid and Auld Bequest, being about SEVEN GUINEAS, divided among them in such proportions as the Prize Committee shall fix, according to merit. To such as deserve it, the Society may add to the amount of the Prize out of its general funds.

GENERAL OBSERVATIONS.

Communications lodged in competition for Prizes shall not have been patented, nor previously published, nor read before any other Society, but Patented Articles may be exhibited and described. The descriptions of the various inventions, &c., must be full and distinct; and be written on Foolscap paper, with binding margins. The relative Drawings to be on Imperial Drawing-paper, and in bold lines, or strongly coloured, so as to be easily seen at about the distance of thirty feet when hung up in the Hall. The Society shall be at liberty to publish in their Transactions the papers submitted to them, or abstracts thereof. Models, &c., for which Prizes are given, to be held the property of the Society; the Value of the Models, &c., being separately allowed for.

Communications to be sent free to the SECRETARY, Chambers, 5 Hill Street, Edinburgh, on or before 1st November, 1859, in order to ensure their being read and reported on during the Session, the ordinary Meetings of which commence in November 1859, and end in April 1860; but those which cannot be lodged earlier will be received up to 1st April, 1860, although they may possibly not be read or reported on till the following Session.

By order,

JOHN BEATSON BELL, Secretary. (287)

Edinburgh, June, 1859.

THE LONDON
WARMING AND VENTILATING COMPANY,
(LIMITED.)
26 GREAT GEORGE STREET, Westminster, S.W.
(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.
Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.
The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(113)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.

ON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description of

RAILWAY PLANT AND IRONWORK.

and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE
(278)

CHADBURN BROTHERS'
METALLIC STEAM GAUGES.

GAUGES have been in use more than three years, given general satisfaction. Those first fixed are good working condition as ever. Testimonials, seen at CHADBURN BROS.' Works, Sheffield, may be had of Messrs. Elliott Bros., Strand; Newgate-street; Messrs. Dring and Fage, ret; Messrs. Nigretti and Zambra, Holborn.

(286)

CAUTION.

ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee informs the above, that all genuine

THE PATENT DOOR SPRINGS.

Doors, are stamped with Name and Address, thus—

H. PATENTEE, 69 PRINCES STREET, LICESTER SQUARE, LONDON, that Springs thus marked are warranted.

PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS

and by all to be the most perfect invention for the Diagrams and List of Prices on application.

(195)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c. — Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments.

(139)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, &c.

43

C. F. QUINTIN'S

PATENT BREAD MACHINE.

The Journeyman Baker's and Servant's Friend. It lightens their labour and makes our daily Food clean and pure.

Highly commended at the Royal Agricultural Show, Chester, 1856, the Royal Agricultural Show, Dublin, 13th and 14th April, 1859, and the Society of Arts, Adelphi, London.

C. F. QUINTIN'S Machines are constructed in various sizes, from Half-a-Peck to Ten Bushels.

Prices from 30s. to £20.

A BAG OF FLOUR MADE INTO DOUGH IN SIX MINUTES.

Manufactory—

1 ST. JAMES'S SQUARE, CHELTENHAM.

Numerous Testimonials can be seen.

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke. One of 10-horse power, 10in. cylinder, and 24in. stroke. Two of 12-horse power, 12in. cylinder, and 24in. stroke. One of 14-horse power, 12in. cylinder, and 30in. stroke. Two of 14-horse power, 14in. cylinder, and 24in. stroke. One of 16-horse power, 14in. cylinder, and 30in. stroke. Two of 20-horse power, 20in. cylinder, and 30in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MEECHAN and other Irons manufactured. WM. F. HOYLE, Proprietor. (275)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Back. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (272)

RANSOME'S PATENT STONE FILTERS—of every description for Domestic purposes, for Manufactories, Public Companies, Shipping, &c.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

TO ENGINEERS & MANUFACTURERS—INDIA-RUBBER WASHERS, Valves, Engine Packing, Fire-engine and Factory Hose-pipes, Gas Tapping, &c.

JAMES LYNE HANCOCK,

Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (258)

TO ENGINEERS, MACHINISTS, &c.—

To be DISPOSED OF, on very reasonable terms, a complete FACTORY, freehold, or can be rented. It is fitted with the best machinery, and has every convenience carrying on a large business. The connexion is small, but (with the interest of the proprietor) could be increased. Part of the money may remain on security. This will be found an excellent opportunity for a small capitalist. There is a good dwelling attached. Apply by letter to Mr. E. Ledger, Lewisham-road, Greenwich. (201)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIA, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 64 King William Street, City, and 6 Tower Hill, London; and at 25 Bath Street, Liverpool. (187)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address, GEORGE RICHARDSON and CO.,

1 New Broad-street, E.C. (27)

VULCANISED INDIA-RUBBER MACHINE

BANDING is NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (288)

MEDALS AWARDED TO THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ: GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (203)

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invites the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTRES, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cones, Albert, Shadowless, and every description of Burner, Union Jets, Batwings, &c.;
IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS,
AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandellers, &c., with complete Book of Prices, 12s. (204)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,
BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,
FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

LAP-WELDED IRON BOILER TUBES. (193)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslayi, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED. (20)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS,

PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SRELLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTORS and ENGINEERS.

2 John-Street, Minories, London, E.C.
Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (199)

A VALUABLE PATENT to be DISPOSED OF.—The Patentee will either dispose of the Patent or grant Licences to any party wishing to manufacture, or would join a person with capital to carry out the Patent. Address, A. Z., MECHANICS' MAGAZINE Office, 166 Fleet-street. (163)

SPIRAL TUBE BRUSHES made with Wire or Whalebone for Tubes of

1½ 1½ 2 2½ 2½ 3 3½ 4 4½ 5 ins. diam.
24/, 25/, 26/, 28/, 30/, 32/, 35/, 38/, 42/, 46/, 50/ per doz
Quantities of Two Dozen and upwards delivered in London.

 Sizes,
 MILLS of all Kinds, FIXED and PORTABLE, for Grind-
 ing Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(34)

GRESHAM'S**PATENT****RECORD****BUOY.**

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to DISTINGUISH IT FROM ANY OTHER FLOATING SUBSTANCE, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within, it HAS RAISED CONSPICUOUSLY UPON ITS SURFACE A SILVERED GLOBE, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make ESPECIAL RECOGNITION OF THESE UNDOUBTED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has Patented his Invention, and has arranged with the old-established Firm of

GEORGE & JOSEPH OLIVER,
286 WAPPING, LONDON, E.,

TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD
 BE ADDRESSED. (202)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

ROYAL POLYTECHNIC INSTITUTION.

Patron, H.R.H. the PRINCE CONSORT.
ENTIRE CHANGE OF ENTERTAINMENT.
MR. MALONE RAYMOND'S Humorous Lecture entitled an "HOUR IN IRELAND AND OTHER LANDS," every Evening except Wednesdays, at a Quarter past Eight.
Illustrations of SCOTTISH BALLADS, by Mr. ANOUS FAIRBAIRN and Miss M. A. BENNETT; Mondays, Wednesdays, and Fridays, at Three.
DISSOLVING VIEWS.—Scenes in ITALY, FRANCE, AUSTRIA, on the RHINE, &c.
LECTURES ON CHEMISTRY and NATURAL PHILOSOPHY.
The OXY-HYDROGEN MICROSCOPE.
The ST. GEORGE'S CHOIR every Wednesday Evening, at Eight. (310)

METROPOLITAN BOARD of WORKS.—MAIN DRAINAGE of the METROPOLIS.—SOUTHERN HIGH LEVEL SEWER.—To BUILDERS, CONTRACTORS, and Others.—The Metropolitan Board of Works hereby give notice, that they will MEET at the Council Chamber, Guildhall, in the City of London, on Friday, the 22nd day of July, inst., at Twelve o'clock at noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of MAIN BRICK SEWERS, Nine Miles 2,940 Feet in length; or thereabouts, and for the execution of other works in connection therewith, to extend from Deptford Creek to High-street, Clapham. Also, a Branch to extend from the Broadway, Deptford, to the point of junction with the Effra Sewer, in Croxted-lane, Dulwich; and for the maintenance of such works in complete repair for twelve calendar months.

Parties desiring to submit Tenders may, upon payment of £3, obtain plans, sections, specification, form of tender, and other particulars, on application at the Office of the Board, between the hours of Nine a.m. and Four p.m.

Tenders addressed to the Metropolitan Board of Works, must be delivered at the Office of the Board, No. 1 Greek-street, Soho, between Four o'clock p.m., on Thursday, the 21st day of July inst., and no Tender will be received after that hour.

The Board do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.
No. 1 Greek-street, Soho, July 2, 1859. (311)

COTTON SUPPLY ASSOCIATION.

IMPROVEMENT upon the INDIAN CHURKA.—All persons intending to submit gins for competition at the above trial, must forward them to the offices of this Association on or before the 19th day of July next, after which day no gin will be received.

The trial will take place on Tuesday, the 26th day of July. Further particulars may be obtained by application at the offices of the Cotton Supply Association.

G. R. HAYWOOD, Secretary.
1 Newall's Buildings, Manchester. (300)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."
(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne,

John Abbott and Co., Park Works, Gateshead, Durham,

J. and E. Lumsden, Strand Iron Works, Sunderland,

N. Hingley and Sons, Cradley and Netherton Iron Works,

Proctor and Taylor, Milbank Forge, Hartlepool,

Henry Wood and Co., George Piazzas, Liverpool,

Wood Brothers, Chesters, Wolverhampton, and Stourbridge,

R. Wight and Sons, Iron Works, Sunderland and Seaham,

Pow and Fawcett, 49 Lr. Shadwell, London, and North Shields,

John Gilbert, Cradley Heath, Staffordshire.

DEPOTS,
GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 George Piazzas, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (249)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (250)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS

and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.

SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (30)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

MR. JOHN HODGSON JONES, Civil Engineer, has Removed his Offices from 1 Poet's Corner to 26 Great George-street, Westminster, S.W.

July, 1859. (309)

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER, 441 Strand, London, W. (302)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.

Address, M. E., 9 Parliament-street, Westminster. (304)

FOR SALE.

TWO SELF-ACTING PLANING MACHINES, nearly new, two feet stroke, working on excentric wheels, with Top Driving Apparatus. Also, some 24 inch Shafting, Binding, &c.

Address, SCHAU and GODFREY, 129 Great Charles-street, Birmingham. (306)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS

and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS.

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

ENGINEERS' TOOLS FOR SALE.—A

Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 8 in. plates. Two Ditto for 4 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RATCHET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (285)

NORTON'S GOSSAMER CARTRIDGES.

FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LITCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street. (307)

JOHN HENDERSON PORTER,
ENGINEER AND CONTRACTOR,
 PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,
IRON BUILDING AND ROOFING WORKS,
 GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.
 Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
 Cast and Wrought Iron Columns, Stanchions, and Girders.
 Ties, Straps, King-heads, Shoes, &c.
 Iron Punt for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.
 Iron Wheelbarrows, Cart Bodies, &c.
 Hay Racks, Mangers, Sheep Cribes, and Cattle Troughs.
 Rick Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.
 The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.; Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

CLAYTON, SHUTTLEWORTH, AND CO.,
 OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
 AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
 And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s **PORTABLE STEAM ENGINES** are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important *reduction in prices* made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from
PERENNIAL AND ITALIAN RYE-GRASS, &c.,
 AND
SCOTT'S PATENT CARROT SEED BEARDING
 AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
 which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,
 Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square, London, N.W. (48)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their **PATENT STEAM WINDING ENGINES AND PLOUGHS**, for Cultivating Land by Steam.

The **WINDING TACKLE** can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Threshing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER AND OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
 Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (216)

WOOD ENGRAVING.

TO THOSE DESIRING ILLUSTRATED CATALOGUES OR CIRCULARS.

C. STEVENS,

OF

10 GOUGH-SQUARE, FLEET-STREET,

Undertakes the preparation of Illustrated Catalogues and Circulars, for Engineers, Agricultural Implement Makers, Ironmongers, Birmingham and Sheffield Warehousemen, and others; and from considerable experience in illustrating mechanical journals, can ensure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Drawings on the Wood Blocks.

ESTIMATES FURNISHED.

ADDRESS,

C. STEVENS,

DRAUGHTSMAN & ENGRAVER ON WOOD,
10 GOUGH-SQUARE, FLEET-STREET. (288)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
 (LIMITED) has RAILWAY WAGGONS for HIRE.
 Apply to the Secretary, 3 Newhall-street, Birmingham. (278)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of Infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (288)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER, SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1/2, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (344)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (343)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.
13 DOCK-STREET, DUNDEE. (380)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

IMPORTANT TO MILLERS AND OTHERS.

HUGHES AND SONS, MILLSTONE MAKERS,
Great Dover-street and Swan-street, Borough, London, S.E.,

BE G to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs, of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kilns, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-Iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

*. ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (340)

CRAWHALL AND CAMPBELL,
MACHINE AND TOOL MAKERS,
AND MILLWRIGHTS,
ELLIOT WORKS, FINNIESTON,
GLASGOW.

Manufacturers of Engineers' Tools of every description, Screwing Apparatus of standard gauge, Boring Grabs, &c. (303)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices. Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (378)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c. — Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments. (139)

TO BRASS-FOUNDERS, ENGINEERS, &c.**THE PATENT PLUMBAGO CRUCIBLE COMPANY**

having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, &c. 43

C. F. QUINTIN'S
PATENT BREAD MACHINE.

The Journeyman Baker's and Servant's Friend. It lightens their labour and makes our daily Food clean and pure.

Highly commended at the Royal Agricultural Show, Chester, 1858, the Royal Agricultural Show, Dublin, 18th and 14th April, 1859, and the Society of Arts, Adelphi, London.

C. F. QUINTIN'S Machines are constructed in various sizes, from Half-a-Peck to Ten Bushels.

Prices from 30s. to £20.

A SACK OF FLOUR MADE INTO DOUGH IN SIX MINUTES.

Manufactory—

1 ST. JAMES'S SQUARE, CHELTENHAM.
Numerous Testimonials can be seen. (246)

EDWIN JEWITT, ENGRAVER ON WOOD
AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (84)

New Publications of H. Bailliere.
ENGINEERING PRECEDENTS FOR STEAM MACHINERY; embracing the Performances of Steam Ships, Experiments with Propelling Instruments, Condensers, Boilers, accompanied by Analysis of the same; the whole being Original Matter. By E. F. ISHERWOOD, Chief Engineer of the U. S. Navy. 8vo, Plates, 6s.
MULLER'S PRINCIPLES OF PHYSICS AND METEOROLOGY; with 530 Woodcuts and Two Coloured Engravings. 8vo, 18s.
WEISBACH'S MECHANICS OF MACHINERY AND ENGINEERING. Two Vols., 8vo, with 900 Woodcuts, £1 18s.
KNAPP, RONALDS, AND RICHARDSON'S CHEMICAL TECHNOLOGY; or, Chemistry in its Applications to the Arts and Manufactures.—Fuel and its Applications. Vol. I., in 2 Parts, 8vo, most fully illustrated with 433 Engravings and 4 Plates. £1 16s.

(This is the Second Edition of Knapp's Technology.)
 Vol. II., 8vo, contains: Glass, Alum, Potteries, Cements, Gypsum, &c. With numerous Illustrations, £1 1s.
 Vol. III., 8vo., contains: Food Generally, Bread, Cheese, Tea, Coffee, Tobacco, Milk, Sugar. With numerous Illustrations and Coloured Plates, £1 2s.

QUEKETT'S (JOHN) PRACTICAL TREATISE ON THE USE OF THE MICROSCOPE. Third Edition, with 11 Steel and numerous Wood Engravings. 8vo., £1 1s.

GRAHAM'S ELEMENTS OF CHEMISTRY. including the Application of the Science in the Arts: Second Edition, with numerous Woodcuts. 2 vols., 8vo., £2.

NICHOL'S ARCHITECTURE OF THE HEAVENS. Ninth Edition, with 23 Steel Plates and many Woodcuts. 8vo., 16s.

MITCHELL'S (J.) MANUAL OF PRACTICAL ASSAYING. For the use of Metallurgists, Captains of Mines, and Assayers in general. Second Edition, much enlarged, with Illustrations, &c., £1 1s.

QUARTERLY (THE) JOURNAL OF THE CHEMICAL SOCIETY. Vol. XI., 8vo., 1859, 13s.

H. BAILLIERE having a house in France, America, and Spain, is enabled to supply all Foreign Scientific Publications as soon as published. He also begs to call attention to his Large Stock of Scientific works, of which a Catalogue will be sent on application.
 London: H. BAILLIERE, Publisher, 219 Regent-street. (136)

RANSOME'S PATENT IMPERISHABLE SILICEOUS STONE.—Chimney-Pieces, Ballustrades, Capitals, Trusses, Terminals, Fountains, Vases, Monuments, &c., of great beauty, at the most reasonable prices.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (147)

CAUTION.
TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princess-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalis, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.
IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery, London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Fary Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using *cross bands* that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lagging, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonmahure, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patents,

WHOLESALE DEALERS IN TOWN AND COUNTRY (20)

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

CHURCH WORK, Ireland.—For rebuilding the church of Killany, County Monaghan; for enlarging the churches of Knocknamuckly, County Down; Donahendry (Stewartstown) and Drumnakilly, County Tyrone; for fitting-up, &c., externally, the churches of St. Anne, County Dublin; Ballymoney, County Antrim; and Leixlip, County Dublin. For repairing the churches of Swift's Alley, City of Dublin; Clouleigh (Lifford), County Donegal; Cooltrain, County Fermanagh; and Cahir (Rathronan), County Tipperary. For repairing and painting externally the churches of Derrykeighan, County Antrim; Killilea, County Armagh; Urney (Cavan), County Cavan; and Trory, County Fermanagh; and for painting internally the churches of St. Mark, City of Dublin; and Cahir, County Tipperary.—Plans and specifications to be seen at the resident ministers of the parishes. Tenders to be addressed, "Proposal for.....the church of....."

"The Ecclesiastical Commissioners for Ireland,"
"No. 24 Upper Merrion-street, Dublin."

BARRACK WORKS, Ireland.—For constructing water-closets to A R K O and Q houses; and water-closets, servants' kitchens, to N and P houses, at Cahir barracks, in the Limerick district. Drawings, &c., Commanding Royal Engineer's Office, Lower Castle-yard, Dublin; or at the Royal Engineers' offices at Limerick and at Cahir barracks. Tenders to the Director of Contracts, War-Office, London, S. W., July 23.

CATHEDRAL WORK, Ireland.—For the roofing, slating, ceiling, glazing, and other works to be done in the new cathedral of St. Patrick's, Armagh, according to plans and specifications at the college adjoining. J. J. McCarthy, architect. Tenders to Henry Savage, Esq., Armagh, August 11.

ROADS, Rusholme.—For the repair and watering of the roads of the local borough for five years, and for the supply of the stone. Tenders, August 1, Mr. J. Law, 53 Piccadilly, Manchester.

PLANS, &c., FOR BATHS AND WASH-HOUSES, Altrincham.—Particulars, Messrs. Nicholls and Worthington, Solicitors, Altrincham.

STEAM ENGINE AND BOILERS, SLUICE VALVES, &c., Chester. At Wallasey, Contract No. 4, for the supply and erection of a steam engine and boilers of about 30 horse power, and pumps capable of lifting 30,000 gallons of water 200 feet high per hour; also a cast-iron water tank 45 feet square and 13 feet deep, with supply pipes, &c. Drawings may be examined, and the necessary papers obtained for £1 from Mr. J. T. Lea, resident engineer, at the offices of the Local Board, or at R. Rawlinson's, C.E., 34 Parliament-street, Westminster. Tenders 4 o'clock, July 20. The same in regard to time, place, and persons to be inquired of concerning a supply of sluice valves, hydrants, and other street fittings. Duplicate specifications, forms of tender, and schedules of prices for 10s.

ENGINE BOILER HOUSE, &c., Merthyr Tydfil Waterworks. Also depositing tanks, filter beds, two covered service reservoirs, two cottages, and other works in connection. Printed specifications, bills of quantities, forms of tender, price two guineas each set, from J. W. Russell, clerk to the Merthyr Tydfil local board, or Mr. Hawksley, C.E., 30 Great George-street, Westminster. Tenders, Mr. Russell, July 20.

POWDER MAGAZINE, Pembroke Dock.—And other buildings connected. Plans, &c., the Royal Engineer-office, Pembroke Dock, and copy of the form of tender, with terms of contract of E. F. Ford, Lieut.-Col. and Col.-Com. Royal Engineers, South Wales District. Tenders, July 25, to the Director of Contracts, War Department, Pall Mall.

ROAD, &c., Weymouth.—For works in road-making and drainage on the Conservative Land Society's Estate. The following are rough quantities, but parties tendering will have to take out quantities for themselves.

Earthwork in embanked roads.....	45,000 yds. cubic.
Ditto backways.....	8,000 "
Material for carriage ways and roads.....	4,800 "
Ditto footpaths.....	480 "
Sewer 3 ft. 6 ins. by 2 ft. 3 ins. (9' work).....	1,500 feet run.
15-inch glazed stone-ware pipes.....	1,200 "
12-inch ditto ditto.....	2,900 "
6-inch ditto ditto.....	5,000 "
Man-holes.....	15 in number.
Gully cesspools.....	51 "
Plans, &c., Mr. James Wilson, 33 Norfolk-st., Strand, London; and of Mr. Wm. Thompson, 11 Frederick-pl., Weymouth. Tenders July 21.	

NEW CHURCH, Winchester.—Plans, &c., except on July 18, Mr. Christian, 10 Whitehall-place, London. Tenders, to 10 a.m., July 20.

CHURCH TOWER, Kent.—For completing the tower of Leigh church, near Tonbridge. Plans, &c., Mr. Charles Bailey, 72 Gracechurch-street, London. Tenders to 1 o'clock, July 27.

CHURCH OF ENGLAND INSTITUTE, Sheffield.—Plans, &c., Messrs. Flockton and Son, architects, East-parade, Sheffield. Tenders, July 18.

WORKHOUSE, Sheffield.—Enlargement and alteration. Plans, &c., Mr. Cushin, architect, 16 Bank-street, Sheffield. Tenders, July 20.

CHELSEA VESTRY HALL.—Drawings, &c., at the office of the architect, Mr. W. W. Roebuck, 10 Trevor-terrace, Knightsbridge. Further particulars to be announced.

HOUSE ON VILLA, Penkridge.—Plans, &c., Littleton Arms, Penkridge, Staffordshire. Tenders, July 25.

RAILWAY CONTRACTORS.—Contractors are wanted for two colonial railways shortly to be brought forward by an English Company, and with a guarantee from the local governments. Applications from principals to Messrs. Bayley Bros., 3 Royal Exchange-buildings.

FARM BUILDINGS, Breydon, Wilts.—New farm buildings at the Home Farm, Breydon, Criclake. Plans, &c., Mr. W. Mantell, architect, Swindon. Tenders July 23.

COALS, Hanwell Laminar Asylum.—About 350 tons of Lambton's and 850 tons of Merthyr, during a twelve-month from July 21 inst., at which date, by noon, tenders must be sent to the Asylum, where blank forms may be had, or of Mr. Wright, clerk to the visitors, 6 John-street, Bedford-row.

COALS, Kensington Workhouse.—200 tons of Lambton's or Hetton Wallsend main, and 100 tons of furnace coal for the engine, to be supplied in quantities of not less than 20 tons. Tenders at the Board Room, July 21.

TO LAMP MANUFACTURERS.—Parties wanted to manufacture a new lamp, an improved form of hook and eye, and a hinge for doors and grates. Apply to Messrs. Wright, 42 Bridge-street, Blackfriars.

The Legislative Assembly of New South Wales have voted £1,000 as the premium for the best design for New Houses of Parliament and Government offices. The competition is to be open to all the world.

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 25 Bath Street, Liverpool. (187)

MR. WALTER HALL is prepared to Grant Licences, or to Dispose of his Patent for working Railway Breaks. Particulars to be had of Mr. HALL, who may be addressed by letter to the care of the MECHANICS' MAGAZINE, 166 Fleet-street, E.C. (217)

WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines. To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Tithefield-street, W.

* Price List of Gauge Fittings, &c., on application. (294)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE (273)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,
(ESTABLISHED A.D. 1778).

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.

STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY, 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

RAILWAY SLEEPERS, &c.

WE are prepared to sell, by Private Contract, about 100,000 Scotch Fir Sleepers, of the various dimensions in use.

Also, any quantity of Larch, and Scotch Fir Poles, Planks, Deals, Staves, and Pitwood.

Early applications will meet the best attention of

REID and FORBES.

45 High-street, Inverness, N.B. (282)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address, GEORGE RICHARDSON and CO.,
1 New Broad-street, E.C. (277)

BRASS ENGINE AND BOILER FITTINGS.

Water-Gauges for Glasses, 2 1/2, 3 1/2, 4 1/2 inch diam. 20, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260, 270, 280, 290, 300, 310, 320, 330, 340, 350, 360, 370, 380, 390, 400, 410, 420, 430, 440, 450, 460, 470, 480, 490, 500, 510, 520, 530, 540, 550, 560, 570, 580, 590, 600, 610, 620, 630, 640, 650, 660, 670, 680, 690, 700, 710, 720, 730, 740, 750, 760, 770, 780, 790, 800, 810, 820, 830, 840, 850, 860, 870, 880, 890, 900, 910, 920, 930, 940, 950, 960, 970, 980, 990, 1000, 1010, 1020, 1030, 1040, 1050, 1060, 1070, 1080, 1090, 1100, 1110, 1120, 1130, 1140, 1150, 1160, 1170, 1180, 1190, 1200, 1210, 1220, 1230, 1240, 1250, 1260, 1270, 1280, 1290, 1300, 1310, 1320, 1330, 1340, 1350, 1360, 1370, 1380, 1390, 1400, 1410, 1420, 1430, 1440, 1450, 1460, 1470, 1480, 1490, 1500, 1510, 1520, 1530, 1540, 1550, 1560, 1570, 1580, 1590, 1600, 1610, 1620, 1630, 1640, 1650, 1660, 1670, 1680, 1690, 1700, 1710, 1720, 1730, 1740, 1750, 1760, 1770, 1780, 1790, 1800, 1810, 1820, 1830, 1840, 1850, 1860, 1870, 1880, 1890, 1900, 1910, 1920, 1930, 1940, 1950, 1960, 1970, 1980, 1990, 2000, 2010, 2020, 2030, 2040, 2050, 2060, 2070, 2080, 2090, 2100, 2110, 2120, 2130, 2140, 2150, 2160, 2170, 2180, 2190, 2200, 2210, 2220, 2230, 2240, 2250, 2260, 2270, 2280, 2290, 2300, 2310, 2320, 2330, 2340, 2350, 2360, 2370, 2380, 2390, 2400, 2410, 2420, 2430, 2440, 2450, 2460, 2470, 2480, 2490, 2500, 2510, 2520, 2530, 2540, 2550, 2560, 2570, 2580, 2590, 2600, 2610, 2620, 2630, 2640, 2650, 2660, 2670, 2680, 2690, 2700, 2710, 2720, 2730, 2740, 2750, 2760, 2770, 2780, 2790, 2800, 2810, 2820, 2830, 2840, 2850, 2860, 2870, 2880, 2890, 2900, 2910, 2920, 2930, 2940, 2950, 2960, 2970, 2980, 2990, 3000, 3010, 3020, 3030, 3040, 3050, 3060, 3070, 3080, 3090, 3100, 3110, 3120, 3130, 3140, 3150, 3160, 3170, 3180, 3190, 3200, 3210, 3220, 3230, 3240, 3250, 3260, 3270, 3280, 3290, 3300, 3310, 3320, 3330, 3340, 3350, 3360, 3370, 3380, 3390, 3400, 3410, 3420, 3430, 3440, 3450, 3460, 3470, 3480, 3490, 3500, 3510, 3520, 3530, 3540, 3550, 3560, 3570, 3580, 3590, 3600, 3610, 3620, 3630, 3640, 3650, 3660, 3670, 3680, 3690, 3700, 3710, 3720, 3730, 3740, 3750, 3760, 3770, 3780, 3790, 3800, 3810, 3820, 3830, 3840, 3850, 3860, 3870, 3880, 3890, 3900, 3910, 3920, 3930, 3940, 3950, 3960, 3970, 3980, 3990, 4000, 4010, 4020, 4030, 4040, 4050, 4060, 4070, 4080, 4090, 4100, 4110, 4120, 4130, 4140, 4150, 4160, 4170, 4180, 4190, 4200, 4210, 4220, 4230, 4240, 4250, 4260, 4270, 4280, 4290, 4300, 4310, 4320, 4330, 4340, 4350, 4360, 4370, 4380, 4390, 4400, 4410, 4420, 4430, 4440, 4450, 4460, 4470, 4480, 4490, 4500, 4510, 4520, 4530, 4540, 4550, 4560, 4570, 4580, 4590, 4600, 4610, 4620, 4630, 4640, 4650, 4660, 4670, 4680, 4690, 4700, 9990, 10000.

With Guards, 2 1/2, 3 1/2, 4 1/2 inch diam. 20, 30, 35, 40, 45, 50, 60, 70, 80, 90, 100, 110, 120, 130, 140, 150, 160, 170, 180, 190, 200, 210, 220, 230, 240, 250, 260, 270, 280, 290, 300, 310, 320, 330, 340, 350, 360, 370, 380, 390, 400, 410, 420, 430, 440, 450, 460, 470, 480, 490, 500, 510, 520, 530, 540, 550, 560, 570, 580, 590, 600, 610, 620, 630, 640, 650, 660, 670, 680, 690, 700, 710, 720, 730, 740,

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description are supplied by us on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of such Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

MEDALS AWARDED TO THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ :
GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1856.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (293)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP

These Pumps are fitted with J. Warner and Son's Patent Bucket and Sucker, and cannot clog in action. The Barrel is of Galvanized Iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

WARNER'S SWING WATER-BARROW.
(To hold Thirty Gallons), £3 3s.

is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump is at a distance from the garden.

MUSICAL SHEEP BELLS, with Straps, in sets of 6, 19s.; ditto, in sets of 8, 25s.; ditto, in sets of 12, 38s.

BRASS STRONGS, from 9s. to 18s.
CONSERVATORY PUMP, No. 22, with Warner's Registered Spreader, 27s. 6d.

Galvanized Iron Tub GARDEN ENGINE, with Warner's Registered Spreader, is strongly recommended for durability and low price, viz., £2 19s., to hold Ten Gallons. Larger sizes, in either wood or iron.

WARNER'S CATTLE AND SHEEP BELLS,
in sets of 6, with Straps, 13s. per set.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c., cast for any size, note, or weight, singly or in peals. Tuned by machinery. Stocked and wheeled ready for fixing. Old Bells re-cast or taken in exchange.

The great 16-ton Bell, for the Houses of Parliament, was made by JOHN WARNER and SONS, 1856, under their Patent.

May be obtained of any Ironmonger or Plumber, in town and Country; or of the Patentees and Manufacturers, as above. (30)

VENTILATION WITHOUT FLUES.
KUKLA'S PATENT STOVES,

At 18s., 25s., and 50s.

KUKLA'S newly-invented Deflagrator—the first and only perfect GAS STOVE. Guaranteed to burn without flue—without dust, smell, or smoke, producing a great and pure heat with the least expenditure of Gas.—*Vide Society of Arts' Journal.*

Patronised by the English and French Government.

Scientific in Principle,
Simple in Construction,
Healthy and efficient in use.

The Deflagrator Stove is cheap, portable, and suited for every situation; and from the principle on which it is constructed (viz., expanding to a sixfold volume the gas used) is capable of warming any given space more quickly and more thoroughly than any other means: while its addition forms a sure remedy for any ill-warmed or ill-ventilated apartments.

The 25s. Deflagrator warms a room of 2,000 cubic feet at a cost of 3d. per day.

The 50s. Deflagrator warms 5 to 6,000 cubic feet at a cost of 6d. per day (twelve hours).

Also, the Greenhouse Stove at 18s.

Patentee and sole Manufacturer, F. X. KUKLA, 194 Pentonville-road, London.

Country orders promptly attended to. Carriage free to any Railway in London.

Post-office Orders should be made payable to FRANCIS XAVIER KUKLA, General Office.

N.B.—Every Stove separately tested before sent out.

The New Gas Cooking Stove for 10 persons, price £3.

LUND'S LONDON LEVER

FOR Drawing Corks is the most simple and efficacious Instrument ever offered to the public for removing the Corks from Bottles without disturbing the contents. The use of this Lever prevents the possibility of any injury to the hand by the accidental breaking of the neck of the Bottle.

Sold by all Cutlers and Ironmongers, and at the Patentee's Wholesale Warehouse, 23, 24, 25 Fleet Street, London. (178)

CHADBURN BROTHERS' PATENT METALLIC STEAM GAUGES

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand; Mr. Fenn, Newgate-street; Messrs. Dring and Page, Tooley-street; Messrs. Nigretti and Zambra, Holborn. (298)

ROYAL POLYTECHNIC INSTITUTION.

Patron, H.R.H. the PRINCE CONSORT.

ENTIRE CHANGE OF ENTERTAINMENT.

Mr. MALONE RAYMOND's Humorous Lecture entitled an "HOUR IN IRELAND AND OTHER LANDS," every Evening except Wednesdays, at a Quarter past Eight.

Illustrations of SCOTTISH BALLADS, by Mr. ARTHUR FAIRBAIRN and Miss M. A. BENNETT; Mondays, Wednesdays, and Fridays, at Three.

DISSOLVING VIEWS.—Scenes in ITALY, FRANCE, AUSTRIA, on the RHINE, &c.

LECTURES ON CHEMISTRY AND NATURAL PHILOSOPHY.

The OXY-HYDROGEN MICROSCOPE.

The St. GEORGE'S CHOIR every Wednesday Evening, at Eight. (310)

COTTON SUPPLY ASSOCIATION.

TRIAL OF COTTON GINS.

IMPROVEMENT upon the INDIAN CHURKA.—All persons intending to submit gins for competition at the above trial, must forward them to the offices of this Association on or before the 19th day of July next, after which day no gin will be received.

The trial will take place on Tuesday, the 28th day of July. Further particulars may be obtained by application at the offices of the Cotton Supply Association.

G. R. HAYWOOD, Secretary.

1 Newall's Buildings, Manchester. (300)

RANSOME'S PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c.

—By this process the softest and most friable Stone, Cement, or Stucco, can be rendered Impervious and Impenetrable decay, at once ARRESTED AND PREVENTED.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

MR. WALTER HALL is prepared to Grant Licences, or to Dispose of his Patent for working Railway Breaks. Particulars to be had of Mr. HALL, who may be addressed by letter to the care of the MECHANICS' MAGAZINE, 160 Fleet-street, E.C. (317)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty, "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne, "John Abbott and Co., Park Works, Gateshead, Durham,

"J. and E. Lumsden, Strand Iron Works, Sunderland,

"N. Hingley and Sons, Cradley and Netherton Iron Works,

"Procter and Taylor, Millbank Forge, Hartlepool,

"Henry Wood and Co., Goree Piazza, Liverpool,

"Wood Brothers, Chester, Wolverhampton, and Stourbridge,

"R. Wight and Sons, Iron Works, Sunderland and Seaham,

"Pow and Fawcett, 49 Lt. Shadwell, London, and North Shields,

"John Gilbert, Cradley Heath, Staffordshire.

DEPOTS,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (249)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 160 Fleet-street. (250)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week. (171)

WANTED, a Gentleman to assist in carrying out an Invention which is now in a state sufficiently advanced to prove almost an absolute certainty of profit; a considerable sum has been expended, and premises are in possession. A capital of £1,000 would be sufficient at commencement, but it would be desirable that an income should be able to command about £3,000 additional, to be introduced as the necessities of the business require it. The business is Colour Making.

Apply by letter to F. F., Messrs. Wm. Dawson and Sons, Booksellers, &c., 74 Cannon-street, City, E.C. (312)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.

SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER, 441 Strand, London, W. (302)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Trainings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

FOR SALE.

TWO SELF-ACTING PLANING MACHINES, nearly new, two feet stroke, working on eccentric wheels, with Top Driving Apparatus. Also, some 2½ inch Shafting, Banding, &c. Address, SCHAUB AND GODFREY, 129 Great Charles-street, Birmingham. (306)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New), beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857), 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY THURSDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858), 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS, Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application. 17, HIGH HOLBORN, LONDON, W.C. Agent at MANCHESTER—E. S. ROGERS, 55 Cannon Street. (321)

THE LONDON
WARMING AND VENTILATING COMPANY,
(LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(12)

JOHN HENDERSON PORTER,
ENGINEER AND CONTRACTOR,
PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,

IRON BUILDING AND ROOFING WORKS,
GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
Cast and Wrought Iron Columns, Stanchions, and Girders.
Ties, Straps, King-heads, Shoes, &c.
Iron Punt for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.
Iron Wheelbarrows, Cart Bodies, &c.
Hay Racks, Mangers, Sheep Cribs, and Cattle Troughs.
Rick Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.

Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C.

(272)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or **Mr. OLIVER, Farmer, Hatfield, Herts.**

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY.

(215)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND

SCOTT'S PATENT CARROT SEED BEARDING

AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, **J. SCOTT, 111 Drummond Street, Euston Square, London, N.W.**

(48)

WOOD- ENGRAVING.

TO THOSE ISSUING ILLUSTRATED CATALOGUES OR CIRCULARS.

C. STEVENS,

10 GOUGH-SQUARE, FLEET-STREET,

Undertakes the preparation of Illustrated Catalogues and Circulars, for Engineers, Agricultural Implement Makers, Ironmongers, Birmingham and Sheffield Warehousemen, and others; and from considerable experience in illustrating mechanical journals, can ensure accuracy of detail both in the Drawing and Engraving. This is secured by employing professed Mechanical Draughtsmen in the preparation of the Drawings on the Wood Blocks.

ESTIMATES FURNISHED.

ADDRESS,

C. STEVENS,
DRAUGHTSMAN & ENGRAVER ON WOOD,
10 GOUGH-SQUARE, FLEET-STREET. (208)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved **EQUILIBRIUM WATER COCK** or **VALVE**, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 106 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER,
SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Sent Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4 in., 4/4 in., 6/4 in., and 7/4 in. Substances, 1 lb. and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (244)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorises but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (238)

FUEL AND STEAM ECONOMY.—Apply to **Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C.** (243)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES. 13 DOCK-STREET, DUNDEE. (200)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his office, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. (264)

18th May, 1859.

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.

LONDON.

(15)

This Day is Published Price 9s.

A TREATISE ON HYDROSTATICS and HYDRODYNAMICS. By W. H. BESANT, M.A., Fellow and Assistant Tutor of St. John's College, Cambridge. Cambridge: DEIGHTON, BELL, and Co. London: BELL and DALDY. (310)

Now published, 8vo. cloth, Price 7s. 6d.

THE SHRAPNEL SHELL in ENGLAND and in BELGIUM, with some reflections on the use of this Projectile in the late Crimean War. An Historical-Technical Sketch, by Major-General BORMANN, Aide-de-Camp to his Majesty the King of the Belgians. London: TRUBNER and CO., 60 Paternoster-row. (280)

Third Edition. Price 1s. 6d., or on Black Rollers and Varnished, 3s. 6d.

A REDUCED ORDNANCE MAP of England and Wales, and the Southern Parts of Scotland; with all the Lighthouses, Sands, and Soundings round the Coast accurately laid down, and showing all the Railway and Mail Packet communications. Published by W. EVERETT and SON, 34 Boulevard Street, City, E.C. (179)

PATENT WEDGE and GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their Works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Incline-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow 146)

THE GENERAL PATENT COMPANY, LIMITED.—Capital, £50,000, in 5,000 Shares of £10 each. Calls not to exceed £2 10s. per Share for the first Year, and no subsequent call to be made without two months' notice. Deposit, 5s. per Share.

TEMPORARY OFFICES.

12 Pancras-lane, Cheapside, E.C., London.

The Company has been formed for the purpose of assisting Inventors, and its contemplated operations comprise—
The taking out of Patents and Registrations for Inventors, and when required, advancing the money for this purpose.

The advancing sums of Money on approved security to Inventors and Patentees, for the purpose of enabling them to develop and complete their Patents and Inventions.

The Purchase and Sale of Inventions and Patents.

The Selling of Patents and Inventions on Commission.

The investigation of the value and merits of Inventions, and the granting of Certificates thereof.

The devotion of a portion of the Company's Premises for the purpose of receiving Models and Drawings of Inventions and Patents.

The keeping a Registry of all Patents taken out by the Company, and the furnishing a Monthly List thereof to all Subscribers.

All information may be obtained at the Office, and the Deposit may be remitted to the Bankers or to the Secretary. (223)

166 FLEET STREET, LONDON, E.C. (16)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor.*

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected.

Every Variety of Gutta Percha Article

NOTICES.

The **MECHANICS' MAGAZINE** will be sent free by post to all subscribers of £1 ls. 8d., annually, payable in advance. Post Office Orders to be made payable to E. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements. To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

The demand for Mr. E. J. REED's paper—

ON THE MODIFICATIONS WHICH THE SHIPS OF THE ROYAL NAVY HAVE UNDERGONE DURING THE PRESENT CENTURY, IN RESPECT OF DIMENSIONS, FORM, MEANS OF PROPULSION, AND POWER OF ATTACK AND DEFENCE," has been so great that the Journal of the Society of Arts, the **MECHANICS' MAGAZINE**, and all other Scientific Journals in which it appeared in December last, are now out of print. The demand still continuing, it has been deemed desirable to reprint it in a separate form. An 8vo. edition of it, in large type, and on fine paper, has, therefore, been prepared, and may now be had at the Office of this Magazine, price 1s.

REMARKS.—Our Metal Market is this week quiet, with a slight reaction in some articles from the prices of last week. The most material fall is in Scotch Pig-iron, which has declined to 52s. 3d. for Mixed Numbers Warrants.

LAWRIE AND HAGGER, Metal Brokers.
33 Lombard-street, E.C.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

RAILWAY WORKS, India.—For the completion of the Bhore Ghaat Incline of the Great Indian Peninsula Railway (Contract No. 7), situated 60 miles from Bombay, at the end of the portion of the South Eastern line in the Concan, which is open for public traffic. Plans, &c., with engineer's estimate, 3 New Broad-street, London. Tenders, one o'clock July 29.

RECTOR, Llanfynydd, Denbighshire.—Plans, &c., Rev. R. Lloyd, Cifynbedd, near Wrexham, Tenders to the architect, Mr. Christian, 10 Whitehall-place, London, July 28.

RAILWAY, Border Union (North British).—For the whole works on the Main Line, the Gretna Branch, and a portion of the Langholm Branch, in separate Contracts as under:—1. The Hawick Contract, commencing at the Hawick Station of the North British Railway, and terminating near Shankend, in length about six miles and four furlongs. 2. The Whitrope contract, commencing near Shankend and terminating near Stayhill Hill, in length about four miles and five furlongs. The above includes a tunnel 1,160 yards in length. 3. The Riccarton Contract, commencing near Stayhill Hill, and terminating at Caldwell Syke, near Riccarton, in length about three miles and three furlongs. 4. The Hermitage Contract, commencing at Caldwell Syke and terminating at New Castleton, in length about six miles and six furlongs. 5. The New Castleton Contract, commencing at New Castleton and terminating where the line crosses Kershop Water, in length about three miles. 6. The

Penton Contract, commencing at the point where the line crosses the Kershop Water and terminating near the Riddings Farm-house, in length about six miles and six furlongs. 7. The Netherby Contract, commencing near the Riddings Farm-house and terminating on the main line near Longtown, in length about four miles and five furlongs; and the Canobie Coal Pits Branch, in length about three furlongs. The total length of the contract being about seven miles and one furlong. 8. The Carlisle Contract, commencing near Longtown and terminating by a junction with the Port Carlisle Railway, near Carlisle, in length about eight miles and four furlongs. 9. The Gretna Branch Contract, commencing at a point on the main line near Longtown, and terminating by a junction with the Caledonian Railway at the Gretna Station on that line, in length about three miles and one furlong. The rails, chairs, &c., will be supplied by the Railway Company. Tenders must be given for each contract separately. The plans, sections, specifications, and draft contract-deeds may be seen at the North British Railway office, Canal-street, Edinburgh, or at the offices of the engineers, Mr. Chas. Jopp, 118 George-street, Edinburgh, and Mr. John E. Tene, 21 Market-street, Newcastle-upon-Tyne, from whom schedules of measurements and forms of tender may be obtained. Copies of the parliamentary plans may be seen at the offices of John Hawkshaw, Esq., C.E., Great George-street, Westminster. Tenders at the offices, Canal-street, Edinburgh, noon, August 17, when contractors or their agents must attend.

RAILWAY, Findhorn, Scotland.—For the construction of the whole works, including supply of rails, chairs, sleepers, &c. Plans, &c., Messrs. Bruce and Cunningham, C.E., 21 Castle-street, Edinburgh. Tenders, John D. Davidson, writer, Forres, August 4.

RAILWAY STATIONS, North Eastern.—For the conversion of the old passenger-station at Durham into a goods-station. Plans, &c., Mr. Prosser, Central Station, Newcastle-upon-Tyne. Tenders, August 3; when also tenders for a station and dwelling-house at the Tyne Dock Station, near South Shields; and for the erection of workshops with iron roof, and other buildings at Tyne Dock. Three contracts.

LANDING PLACE, Portsea.—For reconstructing the hard and landing-place at the Anchor-gate. Drawings, &c., and information, Messrs. Houghton and Son, civil engineers, Union-passage, Portsea. Tenders, July 25.

LONDON MAIN DRAINAGE, Acton Branch.—For main brick and iron sewers, 7,350 ft. in length, with other works in connection therewith, in the Uxbridge-road and at Kensington and Hammersmith. Plans, &c., to the 28th inst. at the office of the Metropolitan Board of Works, 1 Greek-street, Soho.

BREAKWATER, Granton Harbour, near Edinburgh.—Contractors are wanted for the prolongation of the Eastern Stone Breakwater, about 700 yards. Plans, &c., Mr. J. Howkins, engineer, Granton Harbour. Tenders to Messrs. Gibson, W.S., 12 Charlotte-street, Edinburgh, Aug. 13.

WATER-WORKS, Merthyr Tydfil.—Extension of Time.—Engine and boiler-house, depositing-tanks, filter beds, two covered service reservoirs, two cottages, and other works connected. Specifications, &c., Mr. Hawksley, C.E., 30 Great George-street, Westminster. Tenders to J. W. Russell, Clerk to Local Board, Merthyr Tydfil, July 27.

SEWERAGE, Gateshead.—In the western part of the Borough, comprising the excavation of the ground, the laying of the sewer pipes, the providing and setting street gullies, grates, sewer bottoms, and all other necessary works (except sewer pipes and junction blocks, which are included in a separate tender). Particulars, Town Surveyor. Tenders, August 4.

DRAINAGE PIPES AND JUNCTION BLOCKS, Gateshead.—Particulars, Town Surveyor. Tenders, August 4.

CHURCH, Notts.—Restoring and refitting East Markham Church, near Tuxford. Drawings, &c., Rev. G. H. Bramwell, Vicarage, East Markham; to whom tenders August 1. Further information, Mr. G. G. Scott, 20 Spring-gardens, London.

UNITARIAN CHAPEL, Aberdare.—Plans, &c., Mr. W. G. Faulk, 3 St. Mary-street, Cardiff, on and after July 25. Tenders noon, August 2.

SCHOOL, Salisbury.—For building St. Edmund's School and School Residence. Tenders, August 1. Plans, &c., to July 23, St. Edmund's Vestry Room.

REBUILDING AND REPAIRING DYKES, &c., Crown Lands, Stirling.—Plans, &c., H. M.'s Works, Edinburgh; or with Mr. Dewar, farmer, King's-park, Stirling. Tenders, July 26.

ROADS, Hanley Cemetery.—For making terrace roads, paths, surface-draining, cesspools, and laying out and levelling the new public cemetery at Hanley. Plans and specifications at the Borough Surveyor's office, Hanley, the 26th inst. Tenders, Town Clerk, August 3. Bills of quantities on the 28th, the architects, Messrs. Bellamy and Hardy, 30 Broadgate, Lincoln, for 5s. 6d.

ROADS, Rusholme.—For the repair and watering, and supply of stone for five years. Tenders, John Hall, law-clerk to the Board, 53 Piccadilly, Manchester.

COAL, Bilston Gas Company.—4,000 tons. In quantities. The whole by April 1, 1860. Tenders July 28, Gas-works, Moxley, near Wednesbury, Staffordshire.

SOUTH WALES COALS, Nary.—3,000 tons to be delivered at Ascension; 2,000 tons at St. Paul de Loando; and 5,000 tons at the Cape of Good Hope. Conditions, &c., Store-keeper General, Somerset-place. Tenders, two o'clock, July 26.

SLEEPERS, Edinburgh, Perth, and Dundee Railway.—For the supply of from 8,000 to 12,000 sleepers of Scotch fir, each not less than 9 ft. x 10" x 5" or 8" x 5". To be of

a superior quality, and delivered at the Creosoting Works at Perth or Leith within six months after acceptance. Tenders with Secretary, August 1.

MINERAL BLACK FOR PAINT.—For H.M.'s Dockyard, Chatham. Sample, &c., of the Navy Storekeeper General, Somerset-place. Tenders, Aug. 2, at two o'clock.

SURVEYOR, Dorchester.—To devote himself to the carrying out of the private improvements for the drainage and water supply of the borough, under the Public Health Act, 1848. Applications, stating qualifications and salary required, at the Town Clerk's office, August 1.

FOREMAN BOILERMAKER.—Address, stating age, experience, where last employed, and salary expected, "A. B.," Post-office, Ashton-under-Lyne.

GAS-WORKS MANAGER, Callander.—Working Manager, and to take entire charge of the works. Applicants to state salary in own writing to Walter Buchanan, writer, Callander, July 27.

PAPER MILL MANAGER, Scotland.—Where newspaper and printing sorts will be made. Good salary. No. 607 North British Advertiser office, Edinburgh.

ELECTRO-PLATER.—One to take the management of the plating department. Competent to deposit on various metals. M., 43 Birmingham Journal office.

FILERS.—Several hinge filers, and odd work and castor fitters. Apply to J. and J. Siddons, Hill-top New Foundry, Westbromwich.

EXCAVATORS AND LABOURERS.—100. Apply to foreman on the works, Commandale contract, from Kildall to Castleton, near Stokesley, Yorkshire. Working hours, 7 to 6.

A ROLL TURNER.—Albion Iron-Works, Westbromwich.

SHINGLES.—Two, capable of working Condle's steam-hammer. Permanent. Box, 41 Post-office, Swansea.

STOCKERS, SCREWERS-TOGETHER, AND FINISHERS.—For the military trade. 63 Legge-street, Birmingham.

RAILWAY CLERK, India.—Great Indian Peninsula. Competent to take charge under the Accountant of the Audit Office, Bombay. Salary £360 per annum. Applications to Secretary, 3 New Broad-street, July 27.

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by Daw, of Broad-street. (277)

TO WIRE ROPE MAKERS.—ARCHIBALD

SMITH is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 69 Princes-street, Leicester-square, W. (198)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)
15 Wellington-street North, Strand, London, W.C. (270)

RAILWAY AXLE-BOX COMPANY con-

tinue to grant Licenses to manufacture and use AXLE-BOXES under their PATENTS, which include those of Messrs. ADAMS and RICHARDSON, WRIGHTON, NORMANVILLE, VIGURS, and others.

These are the only AXLE-BOXES that effectually EXCLUDE DUST, and prevent the escape of grease, by which an important saving is effected in the wear and tear of the JOURNALS and BEARINGS and the CONSUMPTION OF GREASE.

Further particulars and Licenses may be obtained of P. M. PARSONS, Manager.
9 Arthur-street West, London-bridge, E.C. (283)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

• **THE RAILWAY CARRIAGE COMPANY,**
OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE--34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description of

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE (273)

IMPORTANT TO MILLERS AND OTHERS.

HUGHES AND SONS, MILLSTONE MAKERS,
Great Dover-street and Swan-street, Borough, London, S.E.

BEG to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs, of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kilns, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-Iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

• ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (240)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED
BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address, **GEORGE RICHARDSON and CO.,**

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croft than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 3 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,**PATENT DRY GAS-METER MANUFACTURER,**

SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C.
(293)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.**How's Patent Steam Engine Counters, can be read at sight.**

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED.
(89)**THE IMPERIAL IRON TUBE COMPANY,**

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,

BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,

FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.
(193)**VINEGAR.**—Patronised by Her Majesty's Government.**CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.**

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars'-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTORS and ENGINEERS.

2 John-Street, Minorities, London, E.C.
Are prepared to ESTIMATE FOR AND CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (190)

FOR INVALIDS.—INDIA-RUBBER

WATER BEDS, PILLOWS, and CUSHIONS. Also Inflating Bed-chairs, Air Beds, Pillows, Bolsters, and Air Cushions made any size or design. Price Lists post free on application.—JAMES LYNE HANCOCK, Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (257)

SPIRAL TUBE BRUSHES made with Wire or Whalebone for Tubes of

1½ 1¼ 2 2½ 2¾ 3 3½ 4 4½ 5 ins. diam.
24, 25, 26, 28, 30, 32, 35, 38, 42, 46, 50 per doz
Quantities of Two Dozen and upwards delivered in London.

WILLIAM WALLER, Uddingston, by Glasgow. (313)

VOKINS & HURD,

SEYMOUR HOUSE, JUBILEE PLACE, CHELSEA.

HOT-HOUSE BUILDERS**Hot-Water Apparatus Manufacturers.**

Plans and Estimates forwarded on Application. (149)

CHUBB'S LOCKS, FIREPROOF SAFES, CASH AND DEED BOXES.

PRIZE PORTABLE and FIXED STEAM ENGINES,
 SMITH'S PATENT STEAM PLOUGHS,
 PATENT PRIZE COMBINED THRASHING MACHINES,
 containing R. P. and Co.'s New PATENT CORN
 CLEANER,
 SAWING MACHINERY, CIRCULAR and VERTICAL of all
 Sizes,
 MILLS of all kinds, FIXED and PORTABLE, for Grind-
 ing Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(34)

TRACTION ENGINES,

(BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,

ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and South America, may now be seen, complete and in course of construction at the above works. BOYDELL'S TRACTION ENGINES AND ENDLESS RAILWAY will draw heavier loads over good roads than any other traction engine, and on soft and bad roads will draw heavy loads where no other traction engine can move itself. All objection to the wear and tear of these Engines is entirely removed by the use of Charles Burrell's improved patent Wrought Iron Wheels, fitted with Rails and Tyre, as well as all the wearing parts, of Steel.

47 Apply also to Mr. Hemming,
 Mark Lane, E.C.

(40)

Important to every man who keeps

THORLEY'S FOOD FOR CATTLE,
 77, NEWGATE STREET, LONDON
 Price 50s. per Cask, containing 448 Feeds
 Carriage paid to any Station.
 A Pamphlet, Post-free, on application.

(133)

**NO ADJUSTMENT RE-
 QUIRED.**—You have only to
 place one of

**LUND'S
 LONDON RACK CORK
 SCREWS**

on the neck of a bottle, and it is ready
 for use. Some of these Cork Screws
 are fitted with Patent Spring Ends to
 embrace the neck of the bottle, and so
 direct the worm through the centre of
 the cork.

Sold by the Patentee at 56 and 57
 Cornhill, and 23 and 24 Fleet-street,
 London; and may be had at all Cutlers'
 and Ironmongers'.

(254)

**HORIZONTAL HIGH-PRESSURE
 STEAM ENGINES FOR SALE.**

One of 8-horse power, 8in. cylinder, and 18in. stroke.
 One of 10-horse power, 10in. cylinder, and 24in. stroke.
 Two of 12-horse power, 12in. cylinder, and 24in. stroke.
 One of 14-horse power, 12in. cylinder, and 36in. stroke.
 Two of 14-horse power, 14in. cylinder, and 24in. stroke.
 One of 16-horse power, 14in. cylinder, and 36in. stroke.
 Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufac-
 ture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street,
 London, E.C.

(284)

**CHADBURN BROTHERS'
 PATENT METALLIC STEAM GAUGES.**

THESE GAUGES have been in use more than three years,
 and have given general satisfaction. Those first fixed are
 now in as good working condition as ever. Testimonials,
 &c., may be seen at CHADBURN BROS.' Works, Sheffield.
 The Gauges may be had of Messrs. Elliott Bros., Strand;
 Mr. Fenn, Newgate-street; Messrs. Dring and Page,
 Toolcy-street; Messrs. Nigretti and Zambra, Holborn.

(286)

**CRAWHALL AND CAMPBELL,
 MACHINE AND TOOL MAKERS,
 AND MILLWRIGHTS,
 ELLIOT WORKS, FINNESTON,
 GLASGOW.**

Manufacturers of Engineers' Tools of every description,
 Screwing Apparatus of standard gauge, Boring Crabs, &c.

(303)

BY HER MAJESTY'S ROYAL LETTERS PATENT.
**PATENT SPHERICAL SELF-ADJUSTING
 BEARINGS,** which do not heat in work. The ad-
 vantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be
 put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and,
 therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the
 Patentees.

WALLIS & HASLAM,

Engineers and Iron Founders, North Hants Iron Works,
 Basingstoke.

(171)

TO BRASS-FOUNDERS, ENGINEERS, &c.

**THE PATENT PLUMB-
 BAGO CRUCIBLE COMPANY**
 having completed the enlargement
 of their premises, beg to call the
 attention of all users and shippers
 of Melting Pots to the great supe-
 riority of the PATENT CRUCI-
 BLES, which have been used dur-
 ing the last three years by some
 of the largest melters in England
 and abroad. In addition to their
 capabilities of melting an average
 of from thirty-five to forty pour-
 ings, they are unaffected by change
 of temperature, never crack, but
 can be used till worn out, requiring only one anneal-
 ing for several days' work, and become heated much
 more rapidly than ordinary pots, effecting thereby
 a saving of more than fifty per cent. in time, labour, fuel,
 and waste. The Patent Plumbago Crucible Company also
 manufacture and import clay crucibles, muffles, portable
 furnaces, sublimate pans and covers, glass-pots, all descrip-
 tions of fire-standing goods, and every requisite for the
 assayer and dentist. For Lists, Testimonials, &c., apply
 to Battersea Works, London, &c.

ROYAL POLYTECHNIC INSTITUTION.

Patron, H.R.H. the PRINCE CONSORT.

ENTIRE CHANGE OF ENTERTAINMENT.

Mr. MALONE RAYMOND'S Humorous Lecture entitled an "HOOR in IRELAND and OTHER LANDS," every Evening except Wednesdays, at a Quarter past Eight.

Illustrations of SCOTTISH BALLADS, by Mr. ARTHUR FAIRBAIRN and Miss M. A. BENNETT; Mondays, Wednesdays, and Fridays, at Three.

DISSOLVING VIEWS.—Scenes in ITALY, FRANCE, AUSTRIA, on the RHINE, &c.

LECTURES ON CHEMISTRY and NATURAL PHILOSOPHY.

The OXY-HYDROGEN MICROSCOPE.

The St. GEORGE'S CHOIR every Wednesday Evening, at Eight. (310)

KENNINGTON AGRICULTURAL and CHEMICAL COLLEGE, Lower Kennington-lane, near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL and ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Crushers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

STEAM HUSBANDRY.—NOTICE IS HEREBY GIVEN, for the information of AGRICULTURAL IMPLEMENT MAKERS, that the Government of the Colony of British Guiana offers a premium of 5,000 dollars (about £1,000) for the successful introduction of a STEAM PLOUGH into that Colony; and that a similar premium of 5,000 dollars will also be given for the successful introduction of a STEAM DIGGING or GRUBBING MACHINE.

Further particulars of the work to be done may be learned on application to the Chairman of the West India Association of Glasgow, London, or Liverpool. (317)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c." (Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

- Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.
- John Abbott and Co., Park Works, Gateshead, Durham.
- J. and E. Lumsden, Strand Iron Works, Sunderland.
- N. Hingley and Sons, Cradley and Netherton Iron Works.
- Proctor and Taylor, Millbank Forge, Hartlepool.
- Henry Wood and Co., Goree Piazas, Liverpool.
- Wood Brothers, Chester, Wolverhampton, and Stourbridge.
- R. Wight and Sons, Iron Works, Sunderland and Seaham.
- Pow and Fawcett, 49 Lr. Shadwell, London, and North Shields.
- John Gilbert, Cradley Heath, Staffordshire.

Depôts,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazas, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (349)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, and OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of these having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (350)

HART & SON, MALLEABLE IRON FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week. (77)

WANTED, a Gentleman to assist in carrying out an Invention which is now in a state sufficiently advanced to prove almost an absolute certainty of profit; a considerable sum has been expended, and premises are in possession. A capital of £1,000 would be sufficient at commencement, but it would be desirable that an income should be able to command about £3,000 additional, to be introduced as the necessities of the business require it. The business is Colour Making.

Apply by letter to F. F., Messrs. Wm. Dawson and Sons, Booksellers, &c., 74 Cannon-street, City, E.C. (312)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London. (316)

TO ENGINEERS.—Subsoil Pulverizer.—A

PREMIUM OF TWENTY GUINEAS is offered by the undersigned for an approved draft design (accompanied by a written explanation) of a MACHINE, to consist of a series of augers, for the general pulverization, to a depth of 3 or 4 feet, of a marly soil, free from all obstructions but occasional small pieces of limestone; to be worked by a portable steam engine of 6 horse power, the augers to admit of expeditious liberation from the soil; but their number, shape, position (whether in one or two rows), and distance from each other, are matters left to the judgment of competitors. It is almost needless to add that no existing invention (Fowler's or any other) could effect so deep a pulverization as that considered essential to the efficient cultivation of the Vine in our Australian Colonies. Designs to be sent in on or before the 15th of August.—H. S. WILLS, 10 Queen's-terrace, Queen's-road, Bayswater. (319)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS

and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS.

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

EMIGRATION TO NEW YORK, CANADA,

AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (181)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at OHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Threshing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.

STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

Manufacturers of every Description c.

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE (273)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, &c. 45

EDWIN JEWITT, ENGRAVER ON WOOD
AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (84)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

CRAWHALL AND CAMPBELL, MACHINE AND TOOL MAKERS,

AND MILLWRIGHTS,

ELLIOT WORKS, FINNISLETON, GLASGOW.

Manufacturers of Engineers' Tools of every description, Screwing Apparatus of standard gauge, Boring Grabs, &c. (303)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)

15 Wellington-street North, Strand, London, W.C. (270)

RAILWAY AXLE-BOX COMPANY continue to grant Licenses to manufacture and use AXLE-BOXES under their PATENTS, which include those of Messrs. ADAMS and RICHARDSON, WRIGHTON, NORMANVILLE, VIGORS, and others.

These are the only AXLE-BOXES that effectually EXCLUDE DUST, and prevent the escape of grease, by which an important saving is effected in the wear and tear of the JOURNALS and BEARINGS and the CONSUMPTION OF GREASE.

Further particulars and Licenses may be obtained of

P. M. PARSONS, Manager.
9 Arthur-street West, London-bridge, E.C. (285)

ENGINEERS' TOOLS FOR SALE.—A Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 8 in. plates. Two Ditto for 3 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALET'S and other LIFTING JACKS; RACHET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C. London. (285)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by Daw, of Broad-street. (287)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Be respectful to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (314)

FARRAR'S PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

By J. COOPER. Also, a MAP of the BRITISH ISLES, 5 ft. 6 in. by 5 ft., mounted on Mahogany Rollers and Varished, price 30s. The same Map, on Black Rollers and Varished, 25s.
Published by W. EVERETT and SON, 34 Bouverie Street, City, E.C. (179)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines.

To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

•• Price List of Gauge Fittings, &c., on application. (9a)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY, 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princes-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

RANSOME'S PATENT STONE FILTERS.—Of every description for Domestic purposes, for Manufactories, Public Companies, Shipping, &c.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

MR. WALTER HALL is prepared to Grant Licences, or to Dispose of his Patent for working Railway Bricks. Particulars to be had of Mr. HALL, who may be addressed by letter to the care of the MECHANICS' MAGAZINE, 166 Fleet-street, E.C. (217)

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery, London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonechurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Busses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

**PATENT BRASS LIFT AND
FORCE PUMP,** on Plank, for House
purposes, supply of Cisterns, &c.

2½ inch	£ s.
3 "	6 0
3½ "	7 5
4 "	8 0

A lighter Pump of 3 inches
diameter, can be supplied if
required 5 15

**IMPROVED LIQUID MANURE
OR GENERAL PORTABLE PUMP.**

These Pumps are fitted with J. Warner and Son's Patent Bucket and Sucker, and cannot clog in action. The Barrel is of Galvanised Iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

4½ in. Liquid Manure Pumps, with legs, £3 3s.; 1½ in. Gutta Serena Suction Pipe, 1s. 10d. per foot; 3 in. Flexible Rubber and Canvas Suction Pipe, on Wires, 3s. 3d. per foot. The Barrel is 27½ inches long, and the legs are 5 feet high. Larger sizes of the above if required.

BRASS STRINGERS, from 9s. to 18s.
CONSERVATORY PUMP, No. 27, with
Warner's Registered Spreader, 27s. 6d.

Galvanized Iron Tub GARDEN ENGINE, with Warner's Registered Spreader, is strongly recommended for durability and low price, viz., £3 10s., to hold Ten Gallons. Larger sizes, in either wood or iron.

WARNER'S SWING WATER-BARROW.
(To hold Thirty Gallons), £3 3s.,

is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump is at a distance from the garden.

MUSICAL SHEEP BELLS, with Straps, in sets of 6, 19s.; ditto, in sets of 8, 25s.; ditto, in sets of 12, 33s.

**WARNER'S CATTLE
AND SHEEP BELLS,**
in sets of 6, with Straps,
13s. per set.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c., cast for any size, note, or weight, singly or in peals. Tuned by machinery. Stocked and wheeled ready for fixing. Old Bells re-cast or taken in exchange.
The great 16-ton Bell, for the Houses of Parliament, was made by JOHN WARNER and SONS, 1856, under their Patent.

May be obtained of any Ironmonger or Plumber, in town and Country; or of the Patentees and Manufacturers, as above. (30)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam. The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it. The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place. These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes. Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY.

(215)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of
VULCANIZED INDIA-RUBBER,
SHEETS, WASHERS,
HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1/2, 1, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (244)

**CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT,**

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (288)

FUEL AND STEAM ECONOMY.—Apply to Mr. LES STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON and CO.,**
New Broad-street, E.C. (277)

HIGH-PRESSURE VALVE-COCKS
LAMBERT'S PATENT.

Equilibrium Ball Valve.

Cottage Closet Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

THOMAS LAMBERT and SON,
Brass Founders, Short-street, New-cut, Lambeth. (30)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

D. HULETT & CO.

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

INVITE the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTERS, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batswings, &c.;
IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS,
AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s. (294)

MEDALS AWARDED TO**THOMAS GLOVER'S PATENT DRY GAS-METERS.**

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER.**PATENT DRY GAS-METER MANUFACTURER,**

SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (293)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.**How's Patent Steam Engine Counters, can be read at sight.**

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED. (89)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,**BIRMINGHAM,****Manufacturers of Wrought Iron Tubes & Fittings,**

FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

**VINEGAR.**—Patronised by Her Majesty's Government.**CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.**

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPELLEN, 14 York-street Blackfriars'-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles. Also Machinery for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTORS and ENGINEERS.

2 John-Street, Minories, London, E.C.

Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (199)

FOR DRIVING MACHINERY, MILLS, &c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from
PERENNIAL AND ITALIAN RYE-GRASS, &c.,
 AND
SCOTT'S PATENT CARROT SEED BEARDING.

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
 which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admitted the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer.

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, **J. SCOTT, 111 Drummond Street, Euston Square, London, N.W.**

(48)

GRESHAM'S

RECORD

PATENT

BUOY.

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to DISTINGUISH IT FROM ANY OTHER FLOATING SUBSTANCE, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within, it has RAISED CONSPICUOUSLY UPON ITS SURFACE A SILVERED GLOBE, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make SPECIAL RECOGNITION OF THEM UNDOUBTED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has Patented his Invention, and has arranged with the old-established Firm of

GEORGE AND JOSEPH OLIVER,
286 WAPPING, LONDON, E.,
 TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD
 BE ADDRESSED.

(302)

BRASS ENGINE and BOILER FITTINGS.—

Water-Gauges for Glasses, $\frac{1}{2}$, $\frac{3}{8}$, $\frac{1}{4}$ inch diam.
 With Guards, $\frac{26}{32}$, $\frac{30}{32}$, $\frac{33}{32}$, $\frac{37}{32}$ each.

LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parie Français, Italien, Allemand, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 3s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 15s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two ddbts from Cheapdale.—No charge for the Dies. (323)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 25 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1858, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (341)

HART & SON, MALLEABLE IRON FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week. (77)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B. MECHANICS' MAGAZINE Office, 166 Fleet-street, London. (316)

TO ENGINEERS.—Subsoil Pulverizer.—A

PREMIUM OF TWENTY GUINEAS is offered by the undersigned for an approved draft design (accompanied by a written explanation) of a MACHINE, to consist of a series of augers, for the general pulverization, to a depth of 3 or 4 feet, of a marly soil, free from all obstructions but occasional small pieces of limestone; to be worked by a portable steam engine of 6 horse power, the augers to admit of expeditious liberation from the soil; but their number, shape, position (whether in one or two rows), and distance from each other, are matters left to the judgment of competitors. It is almost needless to add that no existing invention (Fowler's or any other) could effect so deep a pulverization as that considered essential to the efficient cultivation of the Vine in our Australian Colonies. Designs to be sent in on or before the 15th of August.—H. S. WILLS, 10 Queen's-terrace, Queen's-road, Baywater. (312)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSES. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUND, (established 1856,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (304)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS, Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application. 127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 23 Cannon Street. (331)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Reapers, Post Mills, Pumps, Weighing Machines, Corn Binns, their Patent Self-Adjusting Scythes, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. L., 9 Parliament-street, Westminster. (304)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, of CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
 FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
 PRIZE OF £10 FOR FIXED STEAM ENGINE.
 FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
 And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
 PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
 IMPROVED CIRCULAR-SAW BENCHES,
 CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
 PATENT CORN-DRESSING MACHINES AND BLOWERS,
 CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 300 Money Prizes, of £1,400 value, and 31 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gera, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Threshing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (215)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (216)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, &c. 45

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
 One of 10-horse power, 10in. cylinder, and 24in. stroke.
 Two of 12-horse power, 12in. cylinder, and 24in. stroke.
 One of 14-horse power, 12in. cylinder, and 36in. stroke.
 Two of 14-horse power, 14in. cylinder, and 24in. stroke.
 One of 16-horse power, 14in. cylinder, and 36in. stroke.
 Two of 30-horse power, 30in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,

to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (250)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALAN NEWLAND."

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor.*

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

NOTICES.

BOAT-LOWERING APPARATUS.—We are reluctantly compelled to defer the publication of a long letter, received from Mr. Charles Clifford, until next week.

The *MECHANICS' MAGAZINE* will be sent free by post to all subscribers of £1 ls. 8d., annually, payable in advance. Post Office Orders to be made payable to R. A. Broome, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements. To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

THE demand for Mr. E. J. REED's paper—

ON THE MODIFICATIONS WHICH THE SHIPS OF THE ROYAL NAVY HAVE UNDERGONE DURING THE PRESENT CENTURY, IN RESPECT OF DIMENSIONS, FORM, MEANS OF PROPULSION, AND POWER OF ATTACK AND DEFENCE.

has been so great that the *Journal of the Society of Arts*, the *MECHANICS' MAGAZINE*, and all other Scientific Journals in which it appeared in December last, are now out of print. The demand still continuing, it has been deemed desirable to reprint it in a separate form. An 8vo. edition of it, in large type, and on fine paper, has, therefore, been prepared, and may now be had at the Office of this Magazine, price 1s.

REMARKS.—Prices of Metals are steady, with a moderate business doing.

LAWRIE AND HAGGER, Metal Broker.

33 Lombard-street, E.C.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

RAILWAY, Scotland.—For the construction of the Wilson Town Branches of the Caledonian, to the Wilson Town Mineral Fields, a distance of 2½ miles, including earth-work, masonry, &c. Plans, &c., Mr. G. Graham, Engineer, Buchanan-street Station, Glasgow, to August 16, where tenders to the Secretary, 302 Buchanan-street.

SEWERS, Limehouse District.—Certain intended brick and pipe sewers, and maintenance for 13 months. Plans and forms, Board-office, White Horse-street, Commercial-road East. Tenders August 16.

CHURCH, Maidstone.—For the erection of the new district church of St. Paul's. Drawings at offices of Messrs. Pack and Stephens, High-street, Maidstone. Tenders to August 22.

CHURCH, Chew Magna, near Bristol.—For the restoration and re-seating of Chew Magna church. Plans at the vestry-room. Tenders to August 13th.

CATHEDRAL, Armagh.—For the roofing, slating, ceiling, glazing, &c. Plans at the college. Tenders to August 11th.

MARLBOROUGH CASTLE, near Glasbury, Radnorshire.—For erecting an eastern wing, stabling, coach house, &c. Plans at offices of Mr. Rawson, Glasbury, near Glasbury, and of Mr. T. Nicholson, Architect, Hereford. Tenders to August 10th.

POLICE STATIONS at Handsworth and Smethwick.—Plans, &c., office of Mr. C. Trubshaw, County Surveyor. Tenders to Clerk of the Peace's office, Stafford, 20th August.

PAROCHIAL MEETING-HOUSE, Forgue, Aberdeenshire.—For the masons', carpenters', slaters', and other work. Plans, &c., at the Manse. Tenders to August 12th.

FARM BUILDINGS, Milton of Kinmay, Aberdeenshire.—For the masons', carpenters', and slaters' works of additions on the farm of Milton of Kinmay. Plans, &c., Mr. A. Leslie, Land Steward, Kinmay, Aberdeen. Tenders to August 10th.

COLLIERS' COTTAGES, near Morpeth, Newcastle-upon-Tyne.—For twenty-five cottages at Howard's West Hartley colliery. Particulars at the Colliery Office, and a specimen cottage at the colliery. Tenders to the 8th instant.

LEONMONGERY, East India Company.—Conditions at the Secretariat office; where proposals at eleven on the 12th instant.

BROKEN GUERNSEY GRANITE, Limehouse District.—To be delivered on the roads and streets of the district. Particulars and forms, Offices, White Horse-street, Commercial-road East, August 15.

FOREMAN MOULDER.—Accustomed to first-class engine and tool work. Box 32, Post-office, Manchester.

A MILLWRIGHT.—To take charge of the machinery of a works in Staffordshire. Liberal wages to a good man. "T." Post-office, Tipton.

GLASS CUTTERS.—Twelve first-class workmen. Messrs. Cole and Co., Falcon Flint-glass Works, Shelton, Staffordshire.

CIVIL ENGINEERS AND CONTRACTOR'S AGENTS.—Wanted several well-qualified engineers to assist in making a railway in Berar, in India. Salary £800 a-year, and passage paid out. Apply by letter, with certificates, to A. H. Lee, Esq., the College, Edinburgh.

GAS MANAGER.—Immediately by the Gibraltar Gas Company. Salary £150 per annum, with free house, coal, and gas. Apply to K. Laidlaw and Son, Gas Engineers, Glasgow.

STONE BREAKWATER, Scotland.—For the prolongation of the Eastern Stone Breakwater, from the present termination of the outer arm to the shore, a distance of 700 yards, at the Granton Harbour, near Edinburgh. Plans, &c., Mr. J. Hawkins, Engineer, Granton Harbour. Tenders to Messrs. Gibson, W. S., 12 Charlotte-street, Edinburgh, August 13. Proprietor, the Duke of Buccleuch and Queensbury.

PATENT WEDGE AND GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Inclined-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow. 146

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

A VALUABLE PATENT to be DISPOSED OF.—The Patentee will either dispose of the Patent or grant Licences to any party wishing to manufacture, or would join a person with capital to carry out the Patent. Address, A. Z., *MECHANICS' MAGAZINE* Office, 166 Fleet-street. (163)

TO BRASS FOUNDERS.
TO BE SOLD, the Patent-right of a New and Highly-approved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., *MECHANICS' MAGAZINE* Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

WILLIAM WARNE & CO.,
Manufacturers of all descriptions of
VULCANIZED INDIA-RUBBER, SHEETS, WASHERS, HOSE-PIPES, TUBINGS, ETC.;
Sole Manufacturers of
WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of
WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,
Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1, 2, and thicker if required. Length, 20 to 25 yards. Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil. Warehouse, 9 Graham-street West, E.C. Mills, Tottenham, N. (244)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT.

Not only Deodorises but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty oaks, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (238)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. 243

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES. 13 DOCK-STREET, DUNDEE. (280)

BRASS AND COPPER TUBES.
MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address GEORGE RICHARDSON and CO., New Broad-street, E.C. (277)

HIGH-PRESSURE VALVE-COCKS LAMBERT'S PATENT.
Equilibrium Ball Valve. Cottage Closet Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

METAL PROVER

OF HALF A
CENTURY.HUGHES AND SONS, MILLSTONE MAKERS,
Great Dover-street and Swan-street, Borough, London, S.E.

BEG to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kilns, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

* ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (240)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

RICHARD GARRETT AND SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

**NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING,
THRASHING, AND DRESSING MACHINES.**

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.

2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.

3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.

4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (214)

YORKSHIRE TYRE & AXLE WORKS,
ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (275)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (276)

RANSOME'S PATENT IMPERISHABLE SILICEOUS STONE.—Chimney-Pieces, Balustrades, Capitals, Trusses, Terminals, Fountains, Vase Monuments, &c., of great beauty, at the most reasonable prices.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (147)

VULCANISED INDIA-RUBBER MACHINE
BANDING is NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

THORLEY'S FOOD FOR CATTLE,
77, NEWGATE STREET, LONDON

Price 50s. per Cask, containing 448 lbs. Food.

Carriage paid to any Station.

A Pamphlet, Post-free on application. (133)

NO ADJUSTMENT REQUIRED.—You have only to place one of

**LUND'S
LONDON RACK CORK
SCREWS**

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlers' and Ironmongers'. (254)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS.

For Swing Doors, are stamped with Name and Address, thus—

**SMITH, PATENTEE, 69 PRINCES STREET,
LEICESTER SQUARE, LONDON,**

and that Springs thus marked are warranted.

**SMITH'S PATENT WEATHER-TIGHT CASEMENT
FASTENING AND BILL-BARS**

are admitted by all to be the most perfect invention for the purpose: Diagrams and List of Prices on application. (101)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.
These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.
By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.
This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.
This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.
Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED. (89)

MEDALS AWARDED TO THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:
GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.
THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croil than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (203)

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invite the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTERS, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cones, Albert, Shadowless, and every description of Burner, Union Jets, Bathings, &c.;

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin, 18th May, 1859. (264)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

ATLANTIC CABLE.—To Inventors, Patentees, and Manufacturers of Submarine Cables.

All persons having any specimens or plans of Submarine Cables calculated for laying across the Atlantic, are hereby invited to send the same to the Secretary of this Company, together with any description they may desire to append to them, as soon as possible, in order to their being immediately submitted to the Officers of the Company, and by them to the Consulting Committee, for the purpose of examination, testing, and experiment.

By order,

G. SAWARD, Secretary.
Atlantic Telegraph Company, 22 Old-Broad-street, E.C., London, July 29, 1859. (323)

TO PARENTS AND GUARDIANS.—MECHANICAL ENGINEERING.

—There is a Yacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London. (816)

TO ENGINEERS.—Subsoil Pulverizer.—A

PREMIUM of TWENTY GUINEAS is offered by the undersigned for an approved draft design (accompanied by a written explanation) of a MACHINE, to consist of a series of augers, for the general pulverization, to a depth of 3 or 4 feet, of a marly soil, free from all obstructions but occasional small pieces of limestone; to be worked by a portable steam engine of 6 horse power, the augers to admit of expeditious liberation from the soil; but their number, shape, position (whether in one or two rows), and distance from each other, are matters left to the judgment of competitors. It is almost needless to add that no existing invention (Fowler's or any other) could effect so deep a pulverization as that considered essential to the efficient cultivation of the Vine in our Australian Colonies. Designs to be sent in on or before the 15th of August.—H. S. WILLS, 10 Queen's-terrace, Queen's-road, Bayswater. (319)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS.

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.

Address, M. E., 9 Parliament-street, Westminster. (304)

THORLEY'S FOOD FOR CATTLE.—Every

person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY, 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £50 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (215)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to
ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or **Mr. OLIVER, Farmer, Hatfield, Herts.**

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (215)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description of:

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrations of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (20)

FABRAE'S PATENT FOR MAKING STEEL,

IN THREE HOURS IN THE CRUCIBLE, WITHOUT CEMENTATION.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but

can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentists. For Lists, Testimonials, &c., apply to Battersea Works, London, &c. 43

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 30in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 30in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (234)

ENGINEERS' TOOLS FOR SALE.—A
Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 3 in. plates. Two Ditto for 3 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALET'S and other LIFTING JACKS; RATCHET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (235)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LEITCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street. (221)

TO INVENTORS.

INDIA-RUBBER APPARATUS OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE
BANDING IS NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (300)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

Ploughs purchased for Steam Ploughing can also be used for any other operation the Farmer wish. They are all made to move themselves by Steam from field to field, or place to place, being pulled by one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

THE LONDON WARMING AND VENTILATING COMPANY, (LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—MR. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(12)

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER,

SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1/2, 1, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. (244)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (238)

FUEL AND STEAM ECONOMY.—

Now published, 8vo. cloth, Price 7s. 6d.

THE SHRAPNEL SHELL in ENGLAND and in BELGIUM, with some reflections on the use of this Projectile in the late Crimean War. An Historico-Technical Sketch, by Major-General BORMANN, Aide-de-Camp to his Majesty the King of the Belgians. London: TRUBNER and CO., 60 Paternoster-row. (289)

Third Edition. Price 1s. 6d., or on Black Rollers and Varnished, 2s. 6d.

A REDUCED ORDNANCE MAP of England and Wales, and the Southern Parts of Scotland; with all the Lighthouses, Sands, and Soundings round the Coast accurately laid down, and showing all the Railway and Mail Packet communications. By J. COOPER. Also, a MAP of the BRITISH ISLES, 5 ft. 6 in. by 5 ft., mounted on Mahogany Rollers and Varnished, price 50s. The same Map, on Black Rollers and Varnished, 35s. Published by W. EVERETT and SON, 34 Boulevard Street, City, E.C. (179)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (250)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Barge Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

166 FLEET STREET, LONDON, E.C. (16)

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalis, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery, London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Furry Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavored to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY. MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOBS, Lots, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1856,) 23 and 24 MARLBOROUGH ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (304)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

RANSOME'S PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c. By this process the softest and most friable Stone, Cement, or Stucco, can be rendered impervious and imperishable DECAT, AT ONCE ARRESTED AND PREVENTED. For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Can non-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (175)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princess-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (148)

INDIA RUBBER TUBING, for Watering Gardens, Greenhouses, &c., all sizes. Also Brass Spreaders and Union Joints, for connecting the Hose to Cisterns. Illustrated price lists post free. JAMES LYNE HANCOCK, Vulcanised India Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (255)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agri cultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Bruisers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

RICHARD GARRETT AND SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (314)

HUGHES AND SONS,
GREAT DOVER-STREET AND SWAN-STREET, BOROUGH, LONDON, S.E.

H. & SONS beg to call particular attention to their having always on hand a Large Assortment of Improved Screwsocket Rivets, varying in size, from 1/4-inch upwards, for fastening Mill Bands, Elevator Cups, &c., also White and Brown Leases. (206)

JOHN HENDERSON PORTER,
ENGINEER AND CONTRACTOR,
PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,
IRON BUILDING AND ROOFING WORKS,
GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
Cast and Wrought Iron Columns, Stanchions, and Girders.
Ties, Straps, King-heads, Shoes, &c.
Iron Punties for Sugar Estates, &c., &c.
Tanks, Casks, and Barrels.
Iron Wheelbarrows, Cart Bodies, &c.
Hay Racks, Manglers, Sheep Cribes, and Cattle Troughs.
Rick Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.
Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND
SCOTT'S PATENT CARROT SEED BEARDINGAND
CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square, London, N.W. (288)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.

LONDON.

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.

STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invite the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTRES, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;

Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batswings, &c.;

IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS, AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s. (294)

MEDALS AWARDED TO

THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he has ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (336)

VINEGAR.—Patronised by Her Majesty's Government.

**CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.**

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars'-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

**GLADSTONE & Co., CONTRACTOR
and ENGINEERS.**

2 John-Street, Minories, London, E.C.
Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (199)

LUND'S LONDON LEVER

FOR Drawing Corks is the most simple and efficacious Instrument ever offered to the public for removing the Corks from Bottles without disturbing the contents. The use of this Lever prevents the possibility of any injury to the hand by the accidental breaking of the neck of the Bottle.

Sold by all Cutlers and Ironmongers, and at the Patentee's Wholesale Warehouse, 23, 24, 25 Fleet Street, London. (178)

INDIA-RUBBER MANUFACTURES
WITH ALL
RECENT IMPROVEMENTS.

Warehouses, 3 and 4 Bishopsgate Within, E.C. (145)

**ISCA FOUNDRY COMPANY, OLD
BARRACKS, NEWPORT, MON.**
ENGINEERS, AND RAILWAY WAGON BUILDERS.
Manufacturers of Switches, Points, and Crossings,
Chairs, Spikes, Bolts, and General Railway Fittings.

IMPORTANT TO MILLERS AND OTHERS.

HUGHES AND SONS, MILLSTONE MAKERS,

Great Dover-street and Swan-street, Borough, London, S.E.,

BEG to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kils, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-Iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

•• ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (210)

GRESHAM'S

RECORD

PATENT

BUOY.

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to DISTINGUISH IT FROM ANY OTHER FLOATING SUBSTANCE, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within, it has RAISED CONSPICUOUSLY UPON ITS SURFACE A SILVERED ORION, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make SPECIAL RECOGNITION OF THESE UNBOTTLED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has Patented his Invention, and has arranged with the old-established Firm of

GEORGE AND JOSEPH OLIVER,
286 WAPPING, LONDON, E.,

TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD BE ADDRESSED. (212)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,
BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,
FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

LAP-WELDED IRON BOILER TUBES. (198)

CHADBURN BROTHERS' PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand; Mr. Fenn, Newgate-street; Messrs. Dring and Fagg, Tooley-street; Messrs. Nigretti and Zambra, Holborn. (206)

HIGH-PRESSURE VALVE-COCKS LAMBERT'S PATENT.

Equilibrium Ball Valve.

Cottage Closet Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

OF ART, at South Kensington, for Male and Female Students, and METROPOLITAN SCHOOLS OF ART, at 37 Gower-street, for Female Classes only, and at Spitalfields, Crispin-street; Finsbury, William-street, Wilington-square; St. Thomas Charterhouse, Goswell-street; Rotherhithe, Grammar-school, Deptford-road; St. Martin's-in-the-Fields, Castle-street, Long-acre; Lambeth, St. Mary's, Princes-road; Hampstead, Dispensary-building; Christchurch, St. George's-in-the-East, Cannon-street, will re-open on the 1st of October.

Application for admission, prospectuses, or any other information, to be made at the Schools in each district, and at South Kensington.

By authority of
The Committee of Council on Education. (325)

EXAMINATIONS IN SCIENCE.

Teachers wishing to attend the Examinations of the Science and Art Department in, 1, Practical and Descriptive Geometry, with Mechanical and Machine Drawing, and Building Construction; 2, Physics; 3, Chemistry; 4, Geology and Mineralogy (applied to Mining); 5, Natural History, for the purpose of obtaining augmentation grants to their salaries, must send their names, addresses, and present occupation to the Secretary of the Department, South Kensington, on or before the 31st October, 1859. The Examinations will be held in the Metropolis in the last week of November. Certificates of three Grades will be granted in each subject, giving the holder an augmentation grant of £10, £15, or £20 a year on each certificate, while giving instruction to a class of operatives in that subject. These payments will be in addition to the value of any certificates of competency for giving primary instruction which the Teacher may have already obtained from the Committee of Council on Education.

By authority of
The Committee of Council on Education. (326)

FUEL AND STEAM ECONOMY.

Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. 413

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne,

John Abbott and Co., Park Works, Gateshead, Durham,

J. and E. Lumsden, Strand Iron Works, Sunderland,

N. Hingley and Sons, Cradley and Netherton Iron Works,

Proctor and Taylor, Milbank Forge, Hartlepool,

Henry Wood and Co., Goree Piazza, Liverpool,

Wood Brothers, Chester, Wolverhampton, and Stourbridge,

R. Wight and Sons, Iron Works, Sunderland and Seaham,

Pow and Fawcus, 49 Lr. Shadwell, London, and North Shields,

John Gilbert, Cradley Heath, Staffordshire.

DEPOTS,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN,
PATENTEE, 42 CORNHILL, LONDON. (249)

THE ADVERTISER is desirous of an

Engagement as CLERK in a Patent and Designs Office. Having devoted some years to such a Business, and from an extensive acquaintance with Inventors and Inventive, he is qualified to prepare all papers, titles, and ordinary Specifications pertaining to Provisional and Complete Protection, and to discharge the duties of a Patent Agent in the absence of the Principal.

Address—"TRURO," Post-office, Birmingham. (327)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL,
104 ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

HART & SON, MALLEABLE IRON.

FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

ATLANTIC CABLE.—To Inventors, Patentees, and Manufacturers of Submarine Cables.

All persons having any specimens or plans of Submarine Cables calculated for laying across the Atlantic, are hereby invited to send the same to the Secretary of this Company, together with any description they may desire to append to them, as soon as possible, in order to their being immediately submitted to the Officers of the Company, and by them to the Consulting Committee, for the purpose of examination, testing, and experiment.

By order,

G. SAWARD, Secretary.

Atlantic Telegraph Company, 22 Old-Broad-street, E.C., London, July 29, 1859. (323)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANIC'S MAGAZINE Office, 168 Fleet-street, London. (316)

KENNINGTON AGRICULTURAL AND

CHEMICAL COLLEGE, Lower Kennington-lane, near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS,

OIL MERCHANTS.

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.

Address, M. F., 9 Parliament-street, Westminster. (304)

CONDY'S PATENT FLUID or NATURAL

DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (328)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Giers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Searrider, Times or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (315)

THE RAILWAY CARRIAGE COMPANY,

OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER.

Manufacturers of every Description of:

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.

Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (30)

FARRAR'S

PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,

BATTERSEA WORKS, LONDON, S.W. (313)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY

having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but

can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and distiller. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER, 441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE

BANDING IS NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late Dodds, Bacon, and Co., 44 St. Paul's Churchyard, London, E.C. (306)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Wataring the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

HOROLOGY, Theoretical and Practical;
 By JAMES FERGUSON COLE.
 Prospectus of Papers, in Twelve Sections, on the above
 subject, proposed to be published by Subscription.

CONTENTS:—
 PAPER No. 1.—Introductory Observations on the General
 Principles and Construction of Chronometers, Pocket
 Watches, and other Timekeepers; containing also a de-
 scription of the principles of the Detached Lever Escape-
 ment (from which the Horological Lecture, delivered June
 7, 1850, was chiefly extracted); together with rules for
 finding the proper proportions and places of the respective
 parts of the escapement; with the usual mode, and an
 original principle of determining the value of pallet angles
 for any required arc of motion.

PAPER No. 2.—Notes in reference to Paper No. 1.
 PAPER No. 3.—Description of the principles of the Resil-
 lent Lever Escapement in various modes of adaptation, as
 a remedy for the banking error of Lever Pocket Watches.

PAPER No. 4.—Description of the Chronometer Detached
 Escapement in its usual form, and with an improved
 arrangement of the locking and discharging springs.

PAPER No. 5.—Description of a Chronometer Detached
 Escapement, with compulsory locking.

PAPER No. 6.—Description of an original principle of
 Chronometer Detached Escapement, with rotary lockings.

PAPER No. 7.—Description of a Chronometer Detached
 Escapement with abutment lockings.

PAPER No. 8.—Description of the Duplex Escapement.

PAPER No. 9.—Description of Double Rotary or Non-
 repetition Escapements for preventing the detrimental
 effects of external motion on Chronometers and Duplex
 Watches.

PAPER No. 10.—On the principles of the Chronometer
 Balance in its usual form, with the usual mode of adjust-
 ment for temperature and positions.

PAPER No. 11.—Observations referring to other prin-
 ciples of Compensation.

PAPER No. 12.—On the isochronal principles of the
 Balance Spring, with theoretical observations, and prac-
 tical rules for isochronal adjustments.

This small Treatise, having for its object the elucidation
 of principles relating to the Construction of Timekeepers,
 is addressed to the Watch Manufacturing trade, and is
 intended to explain in a concise and intelligible manner the
 various principles treated on as bearing on Horological
 Science, and its practical application, avoiding the rep-
 etition of historical, biographical, and much of the early
 subject matter contained in other voluminous works. This
 work will be comprised in not less than 100 pages octavo,
 with numerous Engravings, carefully drawn to a scale of
 correct working proportions; the whole will be executed
 in the best manner, forming a small volume, at 10s. 6d. per
 copy. The Contents, it is presumed, will be also of utility
 in directing the attention of purchasers to the points of
 construction on which the correct performance of Watches
 and Chronometers materially depends. The publication
 will commence immediately on subscribers' names for 250
 copies being secured, of which number upwards of 150 are
 already obtained.

Intending subscribers are respectfully requested to com-
 municate with the Author, 29 Devonshire-street, Queen
 Square, London, W.C. A List for the reception of
 Subscribers' Names and Addresses is by permission placed
 in the office of the British Horological Institute, 35
 Northampton Square, E.C.
 London, August 1, 1859. (324)

GREAT REDUCTION IN THE COST OF STEAM
POWER.

THE temperature of the products of burnt
 fuel escaping into the Smoke-boxes of Locomotive
 and Portable Engines is upwards of 800°. DUNCAN,
 GWYNNE, and C. WYE WILLIAM'S PATENT HEAT
 DIFFUSERS, placed in the Tubes, will utilize about 400°
 of the heat, convert it into an equivalent of working steam,
 and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part
 of the value of the fuel saved by the use of their simple
 appliances.

Every information may be had on application to the
 Manufacturers, GWYNNE & CO., Engineers, Essex-street
 Wharves, Strand, W.C., London. (251)

"The above engraving represents accurately a section
 of a leaden pipe, which was employed for a short time in
 conveying water from a well on the grounds of Mr. Dick,
 of Bonchurch, Isle of Wight. The water has cut these
 deep pits almost through the pipe, and not only upon the
 portion which we have illustrated, but has formed similar
 chasms throughout the entire length."—*Expositor.*

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the
following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious
 or destructive to the health of the community than the use
 of leaden pipes for the conveyance of water. The poisonous
 salts of lead thereby communicated are most insidious and
 subtle. I hail with gratitude the substitution of Gutta
 Percha Tubing. I have had the leaden pipe of my own
 house removed, and its place supplied with one of Gutta
 Percha. Nothing can be better. I have also recommended
 it to others, who have adopted the expedient."

Resistance of Frost.

The Gutta Percha Company have been favoured with the
following Letters in reference to the non-conducting
properties of Gutta Percha Tubing, in the
resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your
 Gutta Percha Tubing some five or six years ago, has never
 required the slightest attention; and previously, there
 was no winter passed that we were not deluged in con-
 sequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works,
 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting
 properties of the Gutta Percha Piping. On our premises
 we have a leaden Pipe and a Gutta Percha one lying side
 by side. The leaden one has been completely frozen up at
 least ten days, and the Gutta Percha one is still unaffected."

Every Variety of Gutta Percha Article.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

DESIGNS FOR GUILDHALL, AND OTHER PUBLIC BUILDINGS, Cambridge.—At a cost not exceeding \$5,000, and \$300 for the best design, and £100 for the second best. The designs selected to be the property of the Council. Printed particulars at the office of Mr. C. W. Cooper, Town Clerk, Guildhall, Cambridge. Designs, with mottoes only, to 31st October.

STEAM ENGINE, &c., Londonderry.—For a steam-engine and pumping apparatus for Londonderry Graving Dock, conformable to terms to be seen on application to Mr. A. H. Stewart, Clerk to the Harbour Commissioners, Londonderry, or Messrs. D. and T. Stevenson, civil engineers, Edinburgh. Tenders to Mr. Stewart, September 15.

RAILWAY, North-Eastern.—For the construction of a branch (about 1½ miles in length) from the North Yorkshire and Cleveland line to Rosedale, in the North Riding of the County of York. Plans, sections, and specifications, at the Engineer's Office, Central Station, Newcastle, on and after the 1st day of September next. Tenders to J. Cleghorn, York, secretary, marked "Tenders for Rosedale branch," to be sent not later than 9 a.m., September 23rd next.

GUARD HOUSE, WITH CELLS, &c., Dover.—Bill of quantities, on payment of half-a-guinea, at Royal Engineer Office, Dover. Tenders to the Director of Contracts, War-office, Pall-mall, London, S.W., to September 5th.

SEWERING STREET, Crumpton.—Plans for the sewerage of Tyson-street (length 250 yards) of Mr. Bell, surveyor, 51 King-street, Manchester. Tenders to J. Knott, Esq., Overseer's offices, Crescent-road, Crumpton, to September 10th.

MILITARY STORE, Aldershot.—Plans, &c., Royal Engineer's office, Aldershot. Surveyor chosen on the 11th. Copy of the bill of quantities required. Tenders, noon, August 29.

THREE SCHOOL ROOMS, AND MASTER'S RESIDENCE, Pen-snell, near Dudley.—Plans, &c., of the Architect, Mr. W. Bourne, Tower-street, Dudley. Tenders to Church-wardens, August 27th.

TO ENGINEERS, MACHINE-BUILDERS, AND OTHERS.—One of the directors of the Technical office of St. Petersburg, being now in London, invites engineers and others who can supply machinery, steamboats, rails, railway plant, boiler-plates, &c., agricultural and all other implements, of the most improved make, to deposit their prospectuses and price current, with terms of discount, addressed Mr. Havett, care of Grierison, Tweeddale, and Co., La Princes-street, Bank, E.C.

CHURCH, St. Paul's, Maidstone.—Drawings at the office of Messrs. Peck and Stephens, High-street, Maidstone. Tenders to Rev. H. W. Dearden, Boxley-road, Maidstone, to August 22.

SCHOOL-ROOM AND COOKING KITCHEN, WITH LATRINES FOR CHILDREN, ABLUTION-ROOM, &c., at Hilda Barracks, near Portsmouth, Hants.—Plans, &c., Royal Engineer Office, Portsmouth. Tenders to Director of Contracts, War-office, Pall-mall, London.

ENLARGING CORN EXCHANGE, Braintree.—Plans, office of Messrs. Velej and Cannington, solicitors, Braintree. Tenders to Messrs. Beadle, Son, and Chancellor, Chelmsford, August 23rd.

POLICE STATION, Worksop.—Plans, &c., at office of Mr. Goddard, architect, Lincoln. Tenders to office of Messrs. Brodhurst and Hodding, solicitors, Worksop.

DRAINS, Enfield Local Board of Health.—For the making and constructing of a glazed stoneware pipe-drain from the outfall works of the Board to the new cut and sewer of the East London Water Works Company at Ponder's End, on the east side of the Eastern Counties Railway. Plans and specifications at the office of the Board in Enfield town, up to August 25, when and where tenders.

CHURCH, Ireland.—For repairing the Church of Dungarvon, County Kilkenny. The specifications to be seen in the hands of the resident minister of the parish. Tenders to the Ecclesiastical Commissioners of Ireland.

TIN-PLATERS' WARES.—For supplying Her Majesty's Dockyards with tin-platers' wares, under a contract for 13 months certain. Patterns, form of tender, schedule, and conditions, at Somerset-place. Tenders, September 6th.

INSPECTOR OF STEAM BOILERS, For the Steam Boiler Assurance Company.—Must have a thorough practical knowledge of the construction of steam-boilers and engines, and experience in indicating and in mechanical drawing. Apply by letter to Mr. R. B. Longridge, No. 1 New Brown-street, Manchester.

ENGINEER'S FOREMAN.—One who thoroughly understands working drawings, to superintend the making of switches and crossings, turntables, &c., in an engineering establishment. State wages required, and where last employed. P. 18, of the Printer of the *Manchester Guardian*.

TURNERS AND FITTERS.—Wanted, two really first-class, accustomed to general engine and piston work. Address, stating age, experience, and wages. X. Y., Post-office, Openshaw, Manchester.

DRAUGHTSMAN.—Competent to take charge of a drawing-office, and thoroughly acquainted with the locomotive work. A knowledge of marine work also desirable, and would ensure the preference of applications. Box 4, Post-office, Birkenhead.

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE & LLOYD & CO.)

BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,

FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

(195)

GENERAL PATENT COMPANY, LIMITED.—Established for the purpose of assisting Inventors and Patentees in patenting, completing, and developing their Inventions.

PATRONS.

WM. FAIRBAIRN, Esq., C.E., F.R.S., F.G.S., &c., &c.
F. S. POWELL, Esq., Horton Hall, Bradford.

Owing to the increase in the business of this Company, it has removed to more commodious offices at 71 Fleet-street, E.C., where in future the Company will carry on every description of business connected with Patents and Inventions, in the disposal and working of which the Directors are enabled to offer unusual and economical facilities in consequence of their having agents in every large town.

The Company's Engineer, Mr. C. W. Orford, C. and M. E., attends at the offices every Tuesday and Friday, for the purpose of advising with applicants on their Inventions. Special appointments can be made for any day. Applications to be addressed to

ROBERT M. LATHAM, Esq.,

SECRETARY,

71 FLEET STREET, E.C.

Office hours 10 to 4. Saturdays, 10 to 2.

* Applications for shares still received.

(230)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)

15 Wellington-street North, Strand, London, W.C.

(270)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 25 Bath Street, Liverpool. (187)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c.—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY AND DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments. (139)

WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company. These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines. To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

* Price List of Gauge Fittings, &c., on application.

(98)

PATENT WEDGE AND GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their Works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Incline-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow

(146)

FOR CORRECT FAMILY ARMS, CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parle Français, Italien, Allemand, et Hollandais.

—The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheapside.—No charge for the Die. (322)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

RICHARD BAIRD, GENERAL COMMISSION AGENT, AND CONTRACTOR for all descriptions of RAILWAY PLANT and STORES. 13 DOCK-STREET, DUNDEE. (280)

FOR DRIVING MACHINERY, MILLS, &c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

JAMES LYNE HANCOCK, Vulcanised India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (256)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS.

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET, LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (195)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.

2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.

3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.

4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (314)

HUGHES AND SONS,

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.

Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND
SCOTT'S PATENT CARROT SEED BEARDING
AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer.

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square London, N.W. 4

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on Every Tuesday, at One o'clock, and for the present at the BUILDERS' SALE GROUNDS, (established 1856,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S
LONDON RACK CORK
SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and to direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlers' and Ironmongers'. (254)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Bruisers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-approved **EQUILIBRIUM WATER COCK** or **VALVE**, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 106 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY
(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (278)

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER, SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleaned by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1 lb. and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—the only Rubber not affected by Oil.

Warehouse, 9 Greenham-street West, E.C. Mills, Tottenham, N. (244)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.	} From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.
SELF-PROPELLING AND TRACTION ENGINES.	
STONE GRINDING MILLS.	
MORTAR AND PUG MILLS.	
MILLWRIGHTS' WORK of all kinds.	
SAWING MACHINERY, from 4 to 20 Horse Power.	
BRICK AND TILE MACHINES.	

IMPROVED SETS OF FARM MACHINERY, for Large Occupations,
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

D. HULETT & CO.,

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s. (294)

MEDALS AWARDED TO

THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent, and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,

PATENT DRY GAS-METER MANUFACTURER,

SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (293)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SHELLEY, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 3 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principle. Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (144)

GLADSTONE & Co., CONTRACTOR
and ENGINEERS.

2 John-Street, Minories, London, E.C.
Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (139)

IMPORTANT TO MILLERS AND OTHERS.

HUGHES AND SONS, MILLSTONE MAKERS,

Great Dover-street and Swan-street, Borough, London, S.E.,

BEG to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kilns, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

*• ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (240)

TRACTION ENGINES,

(BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,

ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and South America, may now be seen, complete and in course of construction at the above works. BOYDELL'S TRACTION ENGINES AND ENDLESS RAILWAY will draw heavier loads over good roads than any other traction engine, and on soft and bad roads will draw heavy loads where no other traction engine can move itself. All objection to the wear and tear of these Engines is entirely removed by the use of Charles Burrell's improved patent Wrought Iron Wheels, fitted with Rails and Tyre, as well as all the wearing parts, of Steel.

47 Apply also to Mr. Hemming, Mark Lane, E.C.

(40.)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

CHADBURN BROTHERS' PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand; Mr. Fenn, Newgate-street; Messrs. Dring and Page, Tooley-street; Messrs. Nigretti and Zambra, Holborn. (208)

HIGH-PRESSURE VALVE-COCKS LAMBERT'S PATENT.

Equilibrium Ball Valve. Cottage Cistern Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

RAFFAELLE DRAWINGS, belonging to the University of Oxford, with Photographs of Raffaele Cartoons, and other Drawings, will be Exhibited at the South Kensington Museum during the month of August. (321)

THE CENTRAL TRAINING SCHOOL OF ART, at South Kensington, for Male and Female Students, and **METROPOLITAN SCHOOLS OF ART**, at 37 Gower-Street, for Female Classes only, and at Spitalfields, Crispin-street; Finsbury, William-street, Wilmington-square; St. Thomas Charterhouse, Goswell-street; Rotherhithe, Grammar-school, Deptford-road; St. Martin's-in-the-Fields, Castle-street, Long-acre; Lambeth, St. Mary's, Prince's-road; Hampstead, Dispensary-building; Christchurch, St. George's-in-the-East, Cannon-street, will re-open on the 1st of October.

Application for admission, prospectuses, or any other information, to be made at the Schools in each district, and at South Kensington.

By authority of
The Committee of Council on Education. (325)

EXAMINATIONS IN SCIENCE.

Teachers wishing to attend the Examinations of the Science and Art Department in, 1, Practical and Descriptive Geometry, with Mechanical and Machine Drawing, and Building Construction; 2, Physics; 3, Chemistry; 4, Geology and Mineralogy (applied to Mining); 5, Natural History, for the purpose of obtaining augmentation grants to their salaries, must send their names, addresses, and present occupation to the Secretary of the Department, South Kensington, on or before the 31st October, 1859. The Examinations will be held in the Metropolis in the last week of November. Certificates of three Grades will be granted in each subject, giving the holder an augmentation grant of £10, £15, or £20 a year on each certificate, while giving instruction to a class of operatives in that subject. These payments will be in addition to the value of any certificates of competency for giving primary instruction which the Teacher may have already obtained from the Committee of Council on Education.

By authority of
The Committee of Council on Education. (326)

WATER GLASS, or SOLUBLE SILICATES OF SODA or POTASH, in large or small quantities, and either solid or in solution, at **ROBERT RUMNEY'S**, Ardwick Chemical Works, Manchester. (235)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane, near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c. Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT. Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

AN ENGINEER, of First-rate References, wants an Engagement as Manager of a Manufacturing Establishment. Apply, "E. C.," MECHANICS' MAGAZINE, 166 Fleet-street. (231)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their **FINE POWDERED PURE FLOUR PLUMBAGO**, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity. For ordinary polishing purposes it will be found superior to any Black Leads offered. Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

THE PATENT PLUMBAGO CRUCIBLE COMPANY, Battersea Works, London, S.W. (284)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Ayles, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne,

R. Wight and Sons, Iron Works, Sunderland and Seaham,

Pow and Fawcett, 49 Lr. Shadwell, London, and North Shields,

John Gilbert, Cradley Heath, Staffordshire.

Darby,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (340)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week. (77)

TO ENGINEERS, IRON-SHIP AND BRIDGE BUILDERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS, GAS AND RAILWAY COMPANIES, &c.

WARNER'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks, and Repairs of Marine, Locomotive, and other Boilers, indestructible by Fire, Steam, Water, or Gas. Of instant and ready application, it involves great economy of time and labour in making Joints, in place of the ordinary Iron Cement. For Permanent Joints, it can be made to set as hard as iron, and will expand and contract in the same ratio as the metal itself; while for other Joints it can be made sufficiently elastic to answer the purposes of India-rubber or other Packing.—Further Particulars and Prices to be had of W. WARNER and Co., Sole Manufacturers, No. 9 Gresham-street West, E.C., and Mills, Tottenham, N. (230)

ATLANTIC CABLE.—To Inventors, Patentees, and Manufacturers of Submarine Cables.—All persons having any specimens or plans of Submarine Cables calculated for laying across the Atlantic, are hereby invited to send the same to the Secretary of this Company, together with any description they may desire to append to them, as soon as possible, in order to their being immediately submitted to the Officers of the Company, and by them to the Consulting Committee, for the purpose of examination, testing, and experiment.

By order,

G. SAWARD, Secretary.

Atlantic Telegraph Company, 22 Old-Broad-street, E.C., London, July 29, 1859. (323)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London. (318)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS,

Particularly invite attention to their **PATENT ARGAND LAMP OIL**, for Railway Roof and Signal Lamps; also to their **EXTRA-REFINED ENGINE OIL**, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (281)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter to M. E., MECHANICS' MAGAZINE Office, 166 Fleet-street. (360)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, of

(CHESTER):—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE,
ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINE,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 31 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Searrider Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (315)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description of:

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (373)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED: (39)

FARRAR'S

PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

BATTERSEA WORKS, LONDON, S.W. (313)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY

having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 45

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE

BANDING IS NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR; also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (300)

THE LONDON
WARMING AND VENTILATING COMPANY,
(LIMITED.)
26 GREAT GEORGE STREET, Westminster, S.W.
(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldworthy Gurney in both Houses of Parliament.
Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.
The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathes-straips, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, greases, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MEDALS AWARDED TO THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER, PATENT DRY GAS-METER MANUFACTURER,
SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (263)

GENERAL PATENT COMPANY, LIMITED.—Established for the purpose of assisting Inventors and Patentees in patenting, completing, and developing their Inventions.

PATRONS.

WM. FAIRBAIRN, Esq., C.E., F.R.S., F.G.S., &c., &c.
F. S. POWELL, Esq., Horton Hall, Bradford.
Owing to the increase in the business of this Company, it has removed to more commodious offices at 71 Fleet-street, E.C., where in future the Company will carry on every description of business connected with Patents and Inventions, in the disposal and working of which the Directors are enabled to offer unusual and economical facilities in consequence of their having agents in every large town.

The Company's Engineer, Mr. C. W. Orford, C. and M. E., attends at the offices every Tuesday and Friday, for the purpose of advising with applicants on their Inventions. Special appointments can be made for any day. Applications to be addressed to

ROBERT M. LATHAM, Esq.,

SECRETARY,

71 FLEET STREET, E.C.

Office hours 10 to 4. Saturdays, 10 to 2.

* Applications for shares still received. (230)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

THE ADVERTISER is desirous of an Engagement as CLERK in a Patent and Designs Office. Having devoted some years to such a Business, and from an extensive acquaintance with Inventors and Inventions, he is qualified to prepare all papers, titles, and ordinary Specifications pertaining to Provisional and Complete Protection, and to discharge the duties of a Patent Agent in the absence of the Principal.

Address—"Tavro," Post-office, Birmingham. (327)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (288)

WATER GAUGES—WATER GAUGES.

Any, We find your German Gauge Tube superior to other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines. To be had only of E. MOORE, 35 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

* Price List of Gauge Fittings, &c., on application. (294)

HIGH-PRESSURE VALVE-COCKS

LAMBERT'S PATENT.

Equilibrium Ball Valve. Cottage Close Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

THOMAS LAMBERT and SON,

Brass Founders, Short-street, New-cut, Lambeth. (80)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.

13 DOCK-STREET, DUNDEE. (290)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY VALLEY, S.E.

LONDON.

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Reg respectfully to call attention to their.

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (314)

HUGHES AND SONS,

H. & SONS beg to call particular attention to their having always on hand a Large Assortment of Improved Screw-socket Rivets, varying in size, from 1/2-inch upwards, for fastening Mill Bands, Elevator Cups, &c., also White and Brown Laces. (206)

JOHN HENDERSON PORTER,

ENGINEER AND CONTRACTOR,
PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,
IRON BUILDING AND ROOFING WORKS,
GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.
Cast and Wrought Iron Columns, Stanchions, and Girders.
Ties, Straps, King-heads, Shoes, &c.
Iron Punt for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.
Iron Wheelbarrows, Cart Bodies, &c.
Hay Racks, Mangers, Sheep Cribbs, and Cattle Troughs.
Rick Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.
Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

SCOTT'S

PATENT GRASS SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND

SCOTT'S PATENT CARROT SEED BEARDING

AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at Work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square London, N.W. 4

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 6s. 6d.; Carpenters' Rules from 1s. (148)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARKLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Cut Bruiers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

TO BRASS FOUNDERS.

TO BE SOLD, the Patent-right of a New and Highly-improved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.

Address H., MECHANICS' MAGAZINE Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY, 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princess-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

FOR INVALIDS.—INDIA-RUBBER WATER BEDS, PILLOWS, and CUSHIONS. Also Inflating Bed-chairs, Air Beds, Pillows, Bolsters, and Air Cushions made any size or design. Price Lists post free on application.—JAMES LYNE HANCOCK, Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (257)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate. Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

RUSTON, PROCTOR, AND CO.,
LINCOLN; AND KENNET WHARF, 67 UPPER THAMES STREET, LONDON;
AGRICULTURAL ENGINEERS AND MILLWRIGHTS.

MANUFACTURE

PRIZE PORTABLE and FIXED STEAM ENGINES,
 SMITH'S PATENT STEAM PLOUGHS,
 PATENT PRIZE COMBINED THRASHING MACHINES,
 containing R. P. and Co.'s New PATENT CORN
 CLEANER,
 SAWING MACHINERY, CIRCULAR and VERTICAL of all
 Sizes,
 MILLS of all kinds, FIXED and PORTABLE, for Grinding
 Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(24)

GRESHAM'S

PATENT

RECORD

BUOY.

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to distinguish it from any other floating substance, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within. It has RAISED CONSPICUOUSLY UPON ITS SURFACE A SILVERED GLOBE, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make SPECIAL RECOGNITION OF THESE UNDOUBTED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has patented his Invention, and has arranged with the old-established Firm of

GEORGE AND JOSEPH OLIVER,
286 WAPPING, LONDON, E.

TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD
 BE ADDRESSED.

(202)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

CHADBURN BROTHERS'
PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand; Mr. Fenn, Newgate-street; Messrs. Dring and Page, Tooley-street; Messrs. Nigretti and Zambra, Holborn.

WATER GLASS, or SOLUBLE SILICATES OF SODA or POTASH, in large or small quantities, and either Solid or in Solution, at
ROBERT RUMNEY'S, Ardwick Chemical Works, Manchester. (335)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane, near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.
Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.
Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

"Twenty miles per hour is practicable at Sea."

AN ENGINEER having secured Patents for Improvements which will produce the above STATED RESULTS, wishes to meet with a party to join him in commencing business; or he might dispose of a part-interest to an established engineering firm; or treat with a party interested in ocean transit with the object of forming a Company.

Address, Engineer, Messrs. Edwards and James, 18 King-street, Cheapside, E.C. (339)

A MECHANICAL DRAUGHTSMAN wants a Situation. Been used to make Finished, Coloured, and Working Drawings of Engines and Machinery in general, Railway Work, &c. Also had the charge of men erecting. Good testimonials. P. E., 2 Barton-place, Camden-town, London, N.W. (338)

FOR CORRECT FAMILY ARMS, CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Herald's Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parle Français, Italien, Allemand, et Hollandais. The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. LOCK, City Herald's Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Herald's Office No. 2, Old Jewry, E.C., two doors from Cheapside.—N charge for the Die. (322)

EDWIN JEWITT, ENGRAVER ON WOOD AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Traders—see a Catalogue Illustrated. W.C. (34)

AN ENGINEER, of First-rate References, wants an Engagement as Manager of a Manufacturing Establishment.
Apply, "E. C.," MECHANICS' MAGAZINE, 168 Fleet-street. (331)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE
COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.
Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—
THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W. (334)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM
"TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE
Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne, John Abbott and Co., Park Works, Gateshead, Durham.

J. and E. Lumsden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Millbank Forge, Hardlepool.

Henry Wood and Co., Goree Piazza, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wright and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcett, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire.

DUBLIN,
GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (349)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

TO ENGINEERS, IRON-SHIP AND BRIDGE BUILDERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS, GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRO-CEMENT CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks, and Repairs of Marine, Locomotive, and other Boilers, indestructible by Fire, Steam, Water, or Gas. Of instant and ready application, it involves great economy of time and labour in making Joints, in place of the ordinary Iron Cement. For Permanent Joints, it can be made to set as hard as iron, and will expand and contract in the same ratio as the metal itself; while for other Joints it can be made sufficiently elastic to answer the purposes of India-rubber or other Packing.—Further Particulars and Prices to be had of W. WARNE and Co., Sole Manufacturers, No. 9 Gresham-street West, E.C., and Mills, Tottenham, N. (336)

ATLANTIC CABLE.—To Inventors, Patentees, and Manufacturers of Submarine Cables.—All persons having any specimens or plans of Submarine Cables calculated for laying across the Atlantic, are hereby invited to send the same to the Secretary of this Company, together with any description they may desire to append to them, as soon as possible, in order to their being immediately submitted to the Officers of the Company, and by them to the Consulting Committee, for the purpose of examination, testing, and experiment.

By order,
G. SAWARD, Secretary.
Atlantic Telegraph Company, 22 Old-Broad-street, E.C., London, July 29, 1859. (323)

TO PARENTS AND GUARDIANS.—MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 168 Fleet-street, London. (316)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS,

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.
Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (331)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.
Address, M. E., 9 Parliament-street, Westminster. (304)

TO STEAM SHIP BUILDERS, ENGINEERS, TOOL MAKERS, IRON MASTERS, AND OTHERS.

THE ADVERTISER, who has had considerable experience in Marine Engineering and Iron Shipbuilding, and who is an expert Draughtsman, is desirous of meeting with a permanent Engagement as London Agent, Manager of a Shipbuilding Yard, or to act in any capacity in which ample knowledge of Mechanical Details and a large connexion among Engineers, Ship Owners, and others, might be rendered available. The Advertiser having also been much engaged in working out some important patented inventions, would undertake to further the objects of those having property of this kind, either to dispose of or to bring into operation. Apply by letter, to M. E., MECHANICS' MAGAZINE Office, 168 Fleet-street. (304)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-LOCOMOTIVE, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINE,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 300 Money Prizes, of £1,000 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gera, Concord, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (215)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description.

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslayi, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY

having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but

can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 45

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COOKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty. Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Dep't, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

GREAT REDUCTION IN THE COST OF STEAM POWER.
THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°. The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.
 Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

BRASS AND COPPER TUBES.
MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.
 Address GEORGE RICHARDSON and CO., New Broad-street, E.C. (277)

PATENT WEDGE and GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S PATENT SURFACE FRICTIONAL GEARING PATENTS, grant Licenses to Users of Machinery, for the unlimited use of the System in their Works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.
 The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc, Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.
 Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Incline-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.
 This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.
 Office, 20 Buchanan-street, Glasgow. (146)

TO BRASS FOUNDERS.
TO BE SOLD, The Patent-right of a New and Highly-approved EQUILIBRIUM WATER COCK or VALVE, suitable for Steam Boiler Feed Pipes, or any cases where the valve is required to be opened against pressure.
 Address H., MECHANICS' MAGAZINE Office, 166 Fleet-st., where a Drawing may be seen. (151)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Back. Can be applied to existing stock at a trifling expense. Royalty moderate.
 Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar channels throughout the entire length."—*Expositor*.

Poisoned Water Preventable. BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rookingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected.

Every Variety of Gutta Percha Article.

JOHN DIXON & SONS,
STEETON, NEAR KEIGHLEY, YORKSHIRE,

MANUFACTURERS OF

**OLDFIELD AND DIXON'S
PATENT GAS BURNER.**

ALSO,

**HEYWOOD & DIXON'S PATENT KNOBS AND HANDLES,
Timber Merchants and Contractors,
Manufacturers of Keys, Trenails, Bobbins and
Rollers, &c.**

ENLARGED VIEWS OF BURNER.

a Chamber for gas before passing through ordinary slit in caps of Burner.
b Lateral openings for filling the chamber a, their direction being at an angle with or across the opening in cap of burner.

THE Patentees have great pleasure in introducing the **ECONOMIC GAS BURNER** to the notice of the gas consuming public, and feel confident it will be found to possess advantages that cannot be claimed for any other gas burner in present use. This invention may also be called an Anti-pressure Gas Burner, being found to resist a pressure varying from $1\frac{1}{2}$ in. to $2\frac{1}{2}$ in., and giving a light more than double that of the common tulip burner with the same consumption of gas.

In answer to any inquiry which might be made as to how this greatly superior light can be produced from the same quantity of gas, it might be said—by more completely consuming the carbon in the gas.

It is well known that pure hydrogen gas possesses in itself but a very feeble illuminating property. It is to the presence of carbon, and its proper union with the oxygen of the atmosphere during the process of combustion, that the illuminating property is due. The Patentees flatter themselves that they have succeeded with their Burner in making the gas escape in a more favourable state for the reception of its proper quantity of oxygen, and thus more completely converting the carbon into carbonic acid, by which a better light is obtained, and the black deposition of carbon or soot is avoided. The purity of the light thus produced, it may confidently be asserted, will prove a blessing to all in point of health. It may be said further, in recommending this burner to the public, that it is simple and neat in its construction, easy to clean, not liable to corrode, and being made of brass is likely to last for many years.

Nos. 6, 1, 2, 3, 4, Batwing, and Nos. 1 and 2 Tulip, 4s. 6d. per dozen.

Nos. 3 and 4 Tulip, 5s. 6d. per dozen.

One sent through the post on the receipt of Seven Postage Stamps.

TESTIMONIALS.

Messrs. Oldfield and Dixon,

Gentlemen—We have now a considerable number of your Patent Gas Burners in use, and believe there is a great saving over the old burners, but to what extent we cannot say.—We are, gentlemen, yours truly

Saltaire, June 14th, 1859.

TITUS SALT, SONS, & Co.

Messrs. Oldfield and Dixon,

Gentlemen—We have great pleasure in being able to speak very favourably of your Patent Gas Burners, and think the following statement will sufficiently prove an economy in the consumption of gas. About the 20th December last, we placed your No. 2 burners in the shed, and No. 1 burners in the upper rooms of the mill, where the gas had attained a little extra pressure. Previous to the above date we were making gas from five retorts, but since we have been able to dispense with the use of two. We would add that though this gives evidence of a great saving, an equal recommendation rests in the fact of the light produced being of a superior brilliancy and softness.—Yours very respectfully,

Low Mill, Keighley, June 16th, 1859.

J. & J. CRAVEN & Co.

Messrs. Oldfield and Dixon,

Gentlemen—We are glad to report favourably of your Patent Gas Burner, but regret we cannot give you a fair statement of the saving per cent., as we had them put on irregularly some weeks after we had begun to light up. We have usually consumed forty tons of coal for gas; this season we have from six to seven tons on hand, and have made the gas required with one retort—previously we were compelled to use two. We consider the brilliancy of the light and the purity of the atmosphere, through the gas being properly consumed, an attainment quite equal to the economy in fuel.—We are, gentlemen, yours respectfully,

Primrose Mill, Embsay, near Skipton, June 20th, 1859.

ROBINSON & WILKINSON.

Messrs. Oldfield and Dixon,

Gentlemen—We applied your Patent Gas Burner to all our lights in the beginning of last winter; it gave us great satisfaction, and we calculate the saving of gas about 20 per cent., besides a much superior light to the old burner.—Yours respectfully,

Carlton, near Skipton, July 8th, 1859.

WM. & JNO. SLINGSBY.

Messrs. Oldfield and Dixon,

Gentlemen—You have succeeded in inventing an ingeniously contrived Gas Burner, to the illuminating and economising efficiency of which we have pleasure in adding our testimony.—Yours very truly,

Fallage Mill, Burnley, July 12th, 1859.

JOHN HURTLEY & SON.

THE ADVERTISER is desirous of an

Engagement as CLERK in a Patent and Designs Office. Having devoted some years to such a Business, and from an extensive acquaintance with Inventors and Inventions, he is qualified to prepare all papers, titles, and ordinary Specifications pertaining to Provisional and Complete Protection, and to discharge the duties of a Patent Agent in the absence of the Principal.

Address—"TAURO," Post-office, Birmingham. (327)

**CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT,**

Not only Deodorizes but Disinfects perfectly, and

DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.; and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamps. (288)

IMPORTANT TO MILLERS AND OTHERS.

HUGHES AND SONS, MILLSTONE MAKERS,

Great Dover-street and Swan-street, Borough, London, S.E.

BEG to call the attention of Millers, Millwrights, Engineers, Agricultural Machinists, Cement Manufacturers, Distillers, Merchants, and others, to their extensive Stock of FRENCH BURR MILLSTONES, manufactured from a superior Brown Burr, of quality, workmanship, and finish not to be equalled by any house in England. Also to their Stock of French Burrs of various quality and texture, selected by them in person at the best quarries in France, where their choice is unlimited. The extent of their business requiring several thousand Burr Stones annually more than any other Millstone Maker in England (as may be seen by reference to the Custom House "Shipping List"), places them in a position to execute all orders entrusted to them to satisfaction.

H. and S. are also Importers of Peak, Cologne, Granite, and Grindstones direct from the quarries; and have always on hand at their works a varied assortment of Flour Machines, Smut Machines, Bolting Machines, Separators, Kilns, &c.; Wove Wire for Screen Work; Wire Webb for Flour Cylinders; Improved Square Smut Wire, wove by machinery, with rough surface, made to cover any size cylinder in one sheet; Bolting Cloths; Best Oak-tanned Leather Millbands, well stretched and riveted at joints; Webbing for Elevators; Elevating Buckets; Screw Jacks, Proved-Iron Hoisting Chain; Iron and Brass Sheave Blocks; Iron and Slate Provers; Mahogany Staffs; Sack and Heaving Barrows; Cast Steel Mill Bills, of finest Silver Steel; Flour Machine Brushes, made of the best Russian Bristles; and all other articles used in Mills.

HUGHES and SONS employ none but the best Workmen;

and wish to draw attention to the fact that by employing no Travellers, thereby avoiding the necessarily high expenses connected therewith, they are in a position to give their Customers all the advantages from this circumstance, as well as those arising from adequate capital, combined with practical judgment.

*• ALL GOODS DELIVERED FREE TO WHARVES OR RAILWAYS IN LONDON. (240)

MEDALS AWARDED TO
THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1850.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,SUFFOLK STREET, CLERKENWELL GREEN, AND
ALLEN STREET, GOSWELL STREET, E.C. (293)JOHN HENDERSON PORTER,
ENGINEER AND CONTRACTOR,PATENTEE OF VARIOUS IMPROVEMENTS IN THE CONSTRUCTION OF
IRON BUILDINGS, BRIDGES, ROOFS, AND FLOORS,IRON BUILDING AND ROOFING WORKS,
GAS STREET, BIRMINGHAM.

RAILWAY, SHIP, AND BUILDERS' IRONWORK OF ALL KINDS.

Roofs and Bodies of Luggage Vans, Trucks, and Coal Waggon.

Cast and Wrought Iron Columns, Stanchions, and Girders.

Ties, Straps, King-heads, Shoes, &c.
Iron Punt for Sugar Estates, &c., &c.

Tanks, Casks, and Barrels.

Iron Wheelbarrows, Cart Bodies, &c.

Hay Racks, Mangers, Sheep Cribes, and Cattle Troughs.

Rack Stands, and Sliding Roofs of Wrought Iron.

SUBJECTS ILLUSTRATED IN LITHOGRAPHED SKETCHES.

The application of Corrugated Iron Roofing Plates to Roofs of Timber Framing, particularly suitable for the Colonies, Railway Carriage Sheds, and Station Roofs; Iron Sheds for Sugar and Coffee Estates, for Manufactories, Weaving Sheds, &c.; Iron Roofs for Churches, Farm Buildings, Gasworks, &c.

Iron Buildings, viz.—Warehouses, Sugar Refineries, Market Houses, Railway Stations, Stores, Dwellings, &c., erected in this country, in the East and West Indies, Egypt, China, the Cape of Good Hope, South America, and Australia.

Plans and Estimates will be furnished on Application.

LONDON OFFICE—33 NICHOLAS LANE, CITY, E.C. (272)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICE, (established 1837,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1854,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (264)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS.

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET,
LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASES
FASTENING AND SILL-BARS

are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (265)

TO ENGINEERS & MANUFACTURERS.

—INDIA-RUBBER WASHERS, Valves, Engine Packing, Fire-engine and Factory Hose-pipes, Gas Tubing, &c.

JAMES LYNE HANCOCK,

Vulcanized India-Rubber Works, Goswell-mews, and
8 Goswell-road, London, E.C. (256)

RANSOME'S PATENTED PROCESS FOR

PRESERVING STONE, CEMENT, STUCCO, &c.—By this process the softest and most friable Stone, Cement, or Stucco, can be rendered impervious and imperishable, DECAT AT ONCE ARRESTED AND PREVENTED.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (173)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S
LONDON RACK CORK
SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlery and Ironmongers'. (254)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM,

Engineers and Iron Founders, North Hants Iron Works
Basingstoke. (171)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Crushers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handmade Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (218)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support; while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.

SELF-PROPELLING AND TRACTION ENGINES.

From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.

STONE GRINDING MILLS.

MORTAR AND PUG MILLS.

MILLWRIGHTS' WORK of all kinds.

SAWING MACHINERY, from 4 to 20 Horse Power.

BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.

PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.

THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.

CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.

BARLEY AVELLING MACHINES.

CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.

PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.

PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.

PRIZE SEED AND MANURE DRILLS.

LIQUID, SEED, AND MANURE DROP DRILLS.

CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.

GARRETT'S PATENT HORSE HOE for all Crops.

PATENT REVOLVING HOES for Root Crops.

IMPROVED PLOUGHS AND REAPING MACHINES.

&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

N.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (314)

SCOTT'S

PATENT GRASS SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH" "TWITCH" "SPEAR," or "HAIR" GRASS and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND

SCOTT'S PATENT CARROT SEED BEARDING

AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Easton Square London, N.W.

WILLIAM WARNE & CO.,

Manufacturers of all descriptions of

VULCANIZED INDIA-RUBBER,

SHEETS, WASHERS,

HOSE-PIPES, TUBINGS, ETC.;

Sole Manufacturers of

WARNE'S PATENT INDIA-RUBBER TUBULAR MATS,

For Doorways, Stairs, Baths, Carriages, Ships, &c., which never clog, require no beating, and, unlike all other Mats, are readily cleansed by water. Indestructible by damp, these Mats are especially suitable for uncovered Passages, and out of door purposes. Seat Mats, Housemaids' Mats, and Brushes for wooden and stone floors.

Sole Manufacturers of

WARNE'S PATENT MINERALISED IMPROVED KAMPTULICON,

Possessing advantages over all the ordinary makes, in exceeding toughness, and flexibility, and consequent durability, while neither heat nor cold has effect upon it. Widths, 3/4s., 4/4s., 6/4s., and 7/4s. Substances, 1, 2, and thicker if required. Length, 20 to 25 yards.

Patentees of the Red Mineralised India Rubber—th only Rubber not affected by Oil.

Warehouse, 9 Gresham-street West, E.C. Mills, Tottenham, N. 244

MALLETT'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLETT, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. HIGH-PRESSURE VALVE-COCKS LAMBERT'S PATENT.

Equilibrium Ball Valve.

Cottage Closet Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

THOMAS LAMBERT and SON,

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

Engines purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

TRACTION ENGINES, (BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,
ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and South America, may now be seen, complete and in course of construction at the above works. BOYDELL'S TRACTION ENGINES AND ENDLESS RAILWAY will draw heavier loads over good roads than any other traction engine, and on soft and bad roads will draw heavy loads where no other traction engine can move itself. All objection to the wear and tear of these Engines is entirely removed by the use of Charles Burrell's improved patent Wrought Iron Wheels, fitted with Rails and Tyre, as well as all the wearing parts, of Steel.

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,

to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

(For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S. E.**LONDON.**

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to
ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER, Farmer, Hatfield, Herts.
ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (315)

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY

having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest makers in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but

can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

MEDALS AWARDED TO
THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:
GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.
AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croft than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,
PATENT DRY GAS-METER MANUFACTURER,

HIGH-PRESSURE VALVE-COCKS
LAMBERT'S PATENT.

Equilibrium Ball Valve. Cottage Closet Valve.

The Equilibrium Ball-Valve is simple and certain in its action, and is cheaper than the common cocks now in use.

The Cottage Valves are suitable for application to any kind of basin; and, as they shut against the pressure, no concussion in the pipes can possibly occur.

These cocks have been extensively and most successfully used in many towns, under continuous high pressure, varying from 100 to 350 feet; their efficiency and durability is, by experience, established.

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractility and uniformity of substance—their non-susceptibility of injury from contact with oils, greases, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 300 to 360 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From **TRUMAN, HANBURY, BUXTON, & Co.**, Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least twenty pounds a year."

From **JAMES ABERNETHY & Co.**, Furry Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON AND CO.,**
New Broad-street, E.C. (277)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

INDIA RUBBER TUBING, for Watering Gardens, Greenhouses, &c., all sizes. Also Brass spreaders and Union Joints, for connecting the Hose to Cisterns. Illustrated price lists post free.

JAMES LYNE HANCOCK,
Vulcanised India Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (255)

BY HER MAJESTY'S ROYAL LETTERS PATENT:

To Engineers, Railway, Water, and Gas Companies, Iron Ship and Bridge Builders, Marine, Locomotive and Stationary Boiler Manufacturers, &c., Brewers, Distillers, Sugar Refiners, &c.

WARNE'S

NEWLY PATENTED

FERRUGINOUS CEMENT PACKING,

IN SHEETS AND WASHERS,

Applicable to Steam, Water, Air, and Gas Joints of all descriptions, in place of Iron Cement, Sheet Lead, Red and White Lead, Gasket, Millboard, &c.

1. To Cylinder, Air and Vacuum Pump Covers and Doors, Condensers, hot and cold Liquor Pumps, Valve Covers, Steam feed and water flange and socket pipe joints, Man and Mud-Hole joints, to CAST IRON TANKS, and to repairs of Marine, Locomotive, and Stationary Boilers, &c.

2. To RAILWAY purposes, to the bedding of Rails, Chairs, and fish joints, to the bedding and adjusting of Girders and Turn Tables—to the construction of IRON BARROWS and of IRON SHIPS, and to bedding Marine Boilers on Bearers, &c., &c.

3. To Gas Mains and Pipes, Retort joints, to the construction of Gasometers and Gasholders, &c., &c.

4. To all joints of Steam, hot and cold liquor Pipes and Pumps for Brewers, Distillers, Sugar Refiners, Chemical Manufacturers, Tanners, Dyers, and in fact all uses where the common Iron Cement, Lead, or other joint has been hitherto applied.

The important advantages of the PATENT FERRUGINOUS CEMENT PACKING consists in the *Indestructibility* of the material, either by Fire, Steam, Water, or Gas—in its *instant and ready* application—and in its great economy of time and labour in making joints, in place of the ordinary Iron Cement. For all permanent joints (elastic before its application) it can be made to set as hard as Iron, and it will expand and contract in the same ratio as the Metal; while, for all other joints, it can be made sufficiently elastic to answer all the purposes of India-rubber or other Packing.

Directions for Use.—Immediately before use, the Patent Ferruginous Packing, when intended for permanent joints, should be pickled for at least Six Hours in a solution of Sal Ammoniac— $\frac{1}{2}$ lb. to a pint of Water; when not intended for permanent joints, the pickling is not necessary.

Sole Manufacturers—

WILLIAM WARNE & CO.,

9 Gresham-street-west, E.C.—Mills, Tottenham, N. (340)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines.

To be had only of E. MOORE, 55 Upper Marylebone street, W.; and 72 Great Titchfield-street, W.

* Price List of Gauge Fittings, &c., on application. (924)

FOR CORRECT FAMILY ARMS

CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parle Français, Italien, Allemand, et Hollandaïs.

* The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office No. 2, Old Jewry, E.C., two doors from Cheap-side.—N charge for the Die. (322)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. **SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (33)**

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,
BIRMINGHAM,

Manufacturers of Wrought Iron Tubes & Fittings,
FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES. (193)

SCOTT'S

PATENT GRASS SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND

SCOTT'S PATENT CARROT SEED BEARDING

AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square
London, N.W.

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

Engines purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

(23)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pounds, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one smelting for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W.

CHADBURN BROTHERS'

PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand; Mr. Penn, Newgate-street; Messrs. Dring and Page, Tooley-street; Messrs. Nigretti and Zambra, Holborn.

THE CENTRAL TRAINING SCHOOL OF ART, at South Kensington, for Male and Female Students, and **METROPOLITAN SCHOOLS OF ART,** at 37 Gower-Street, for Female Classes only, and at Spital-fields, Crispin-street; Finsbury, William-street, Wilmington-square; St. Thomas-Charterhouse, Goswell-street; Rotherhithe, Grammar-school, Deptford-road; St. Martin-in-the-Fields, Castle-street, Long-acre; Lambeth, St. Mary's, Princes-road; Hampstead, Dispensary-building; Christchurch, St. George's-in-the-East, Cannon-street, will re-open on the 3rd of October.

Application for admission, prospectuses, or any other information, to be made at the Schools in each district, and at South Kensington.

By authority of
The Committee of Council on Education. (325)

MACHINERY of all kinds **DRAWN** and **ENGRAVED** on **WOOD**, with the greatest accuracy of detail and Artistic Effect, by
L. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

SELF-ACTING VALVE REGULATORS,
Registered No. 4064.

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, **R. RAMAGE,** late Fairs and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cup Ventilator dispensing with Balance Weight, &c.

Factory:—
55a HOLYWELL-ST., MILLBANK, S.W., LONDON. (348)

BALLOONS or Boats Driven by Steam.—The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 15 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lilford-road, Camberwell. These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of **RAILWAY PLANT and STORES.**
15 DOCK-STREET, DUNDEE. (359)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Boker's, and equivalent in all respects to ordinary Anchors of 38 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE
Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dumbear, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS
Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—
Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.

"John Abbott and Co., Park Works, Gateshead, Durham.

"J. and E. Lumden, Strand Iron Works, Sunderland.

"N. Hingley and Sons, Cradley and Netherton Iron Works.

"Proctor and Taylor, Milbank Forge, Hartlepool.

"Henry Wood and Co., Goree Piazza, Liverpool.

"Wood Brothers, Chester, Wolverhampton, and Stourbridge.

"R. Wight and Sons, Iron Works, Sunderland and Seaham.

"Pow and Pevens, 49 Lr. Shadwell, London, and North Shields.

"John Gilbert, Cradley Heath, Staffordshire.

Durors,
GEORGE WOOD & CO., 14 Fore-st., Limehouse, London,
and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN,
PATENTEE, 49 CORNHILL, LONDON. (349)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin.

18th May, 1859. (364)

THE IMPERIAL IRON TUBE COMPANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham. Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanized Tubes, and Lap-welded Iron Boiler Tubes. (347)

HART & SON, MALLEABLE IRON.

FOUNDERS, 4-Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (377)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE POCKET STEREOSCOPIC PANORAMA,
FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S,
85 King William-street, City. (345)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane, near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, **H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London.** (316)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS,
OIL MERCHANTS.

Particularly invite attention to their **PATENT ARGAND LAMP OIL,** for Railway Roof and Signal Lamps; also to their **EXTRA-REFINED ENGINE OIL,** for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—**E. S. ROGERS, 33 Cannon Street.** (281)

J. W. CLARE, C.E., Inventor of the Patent

Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to **JOSEPH THORLEY, 77 Newgate Street, London.**

N.B.—The public are cautioned against being imposed upon by worthless imitations. (358)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at

CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF \$10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as for Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE,
ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gera, Condon, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For Exportation.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to
ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER, Farmer, Hatfield, Herts.
ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (316)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description of:

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (30)

**FARRAR'S
PATENT FOR MAKING STEEL,**

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotives and Portable Engines is upwards of 800°. DUNCAN, Gwynne, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 40° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 250° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every Information may be had on application to the Manufacturers, Gwynne & Co., Engineers, Essex-street Wharves, Strand, W.C., London. (361)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID BOLLED
BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON and CO.,**
New Broad-street, E.C. (37)

**HORIZONTAL HIGH-PRESSURE
STEAM ENGINES FOR SALE.**

One of 8-horse power, 8in. cylinder, and 14in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 24in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 24in. stroke.
Two of 20-horse power, 20in. cylinder, and 24in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to **PAGE and CAMERON, 64 Old Broad-street, London, E.C.** (364)

**CRAWHALL AND CAMPBELL,
MACHINE AND TOOL MAKERS,**

AND MILLWRIGHTS,

**ELLIOT WORKS, FINNINGTON,
GLASGOW.**

Manufacturers of Engineers' Tools of every description, Sewing Apparatus of standard gauge, Boring Grabs, &c. (366)

ENGINEERS' TOOLS FOR SALE—A

Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 1 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 1 in. plates. Two Ditto for 1 in. plates, and Two Ditto for 1 in. plates. VERTICAL DRILLING MACHINE; MILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RACET BRACES, &c.

Apply to **PAGE and CAMERON, 64 Old Broad-st., E.C., London.** (366)

**NORTON'S GOSSAMER CARTRIDGES,
FOR MILITARY FIRE-ARMS.**

These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street. (371)

TO INVENTORS.

**INDIA-RUBBER APPARATUS
OF EVERY KIND MADE TO ORDER.**

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (388)

VULCANISED INDIA-RUBBER MACHINE

BANDING is NOT AFFECTED BY WET, HEAT, OIL, COAL; does not stretch nor slip on the pulleys. RUBBERS for BREWERIES, &c., will not impart taint, smell, or colour; also for conducting, or steam purposes. Valves, Shafts, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co.,
44 St. Paul's Churchyard, London, E.C. (389)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Searifier.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

**W. BLACKETT,
HOPE IRON WORKS.
SOUTHWARK BRIDGE ROAD,
LONDON.**

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

THE LONDON WARMING AND VENTILATING COMPANY, (LIMITED),

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—MR. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.
Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.
The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application. (12)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentists. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

LUND'S LONDON LEVER

FOR Drawing Corks is the most simple and efficacious Instrument ever offered to the public for removing the Corks from Bottles without disturbing the contents. The use of this Lever prevents the possibility of any injury to the hand by the accidental breaking of the neck of the Bottle.
Sold by all Cutlers and Ironmongers, and at the Patentee's Wholesale Warehouse, 23, 24, 25 Fleet Street, London. (178)

WATER GAUGES—WATER GAUGES.
Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company. These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.
Extensively used on all the principal lines.
To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.
** Price List of Gauge Fittings, &c., on application. (94)

BY HER MAJESTY'S ROYAL LETTERS PATENT.
PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

IMPORTANT TO MANUFACTURERS MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the failing of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Fary Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patenters,

WHOLESALE DEALERS IN TOWN AND COUNTRY (20)

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

MANSION, Scotland.—Mansion and offices at Drumpark, seven miles from Dumfries, for Francis Maxwell, Esq. Plans, &c., at the chambers of Mr. John Cunningham, Liverpool, Oct. 1.

RAILWAY WORKS, Ireland.—The time for receiving tenders for the execution of the works between Newtownards and Bangor and Donaghadee, on the Belfast and County Down Railway has been extended to Oct. 4. Plans, &c., at the office of the Secretary, Mr. T. Ward, Queen's Quay, Belfast.

RAILWAY STATION HOUSE, Scotland.—And goods shed, for Killoch Station of the Maybole and Girvan Railway. Plans, &c., Secretary's office, Girvan. Further information of the engineer, Mr. J. Miller, 25 Northumberland-street, Edinburgh. Tenders to Mr. J. Macinmont, Secretary, Girvan, Sept. 27.

RAILWAY STORIES, South Eastern.—For the supply of stores from Sept. 30th, 1859, to March 31st, 1860. The articles include iron, axles, tyres, forgings, &c.; general ironmongery, tools, &c.; files, steel, springs, &c.; sheet-brass, brass and copper tubes, finished brass works, &c.; and tin, tin-work, lead, zinc, and other metals. Specifications and forms, Storekeeper, London-bridge terminus. Patterns at Bricklayers' Arms station. Tenders, Sept. 27, to S. Smith, the Secretary, London-bridge terminus.

TIMBER, Falmouth Docks.—For the supply of about 98,000 cubic feet of American red pine, Messel and Dantale timber. Specifications and conditions, Mr. J. P. Bennetts, Secretary to the Docks Company; or to Mr. J. Abernethy, C.E., 3 Parliament-street, Westminster. Tenders at the office of the company on the 30th inst.

MASTERS, Navy.—For supplying Her Majesty's dockyards with North American yellow pine masts, yards, and bowsprits, ash car rafters, and spruce deals, red pine, yellow pine, and rock elm timber. Form and conditions, Somerset-place. Tenders, with attendance, personally, or by agent, two o'clock, Oct. 25, with bond for £2,000.

WATER-PIPES, Scotland.—Wanted immediately three-quarters of a mile of cast-iron water-pipes, best quality, of six feet lengths, and one and a half inches diameter; each pipe to be properly tested, to bear a heavy pressure. The pipes to be laid down at Maryport. Particulars, Mr. W. M. Sewell, Hayborough House, by Maryport.

WATER METERS, Liverpool.—The makers of meters are invited to send a sample of 1-in. meter, together with a statement of the price at which the meter would be supplied, to the Water-Works office, Holtham-street, Liverpool, Oct. 15.

ROAD, Ashton-under-Lyne.—About three miles in length, between Hurst and Lees. Plans, sections, and quantities, at the offices of Mr. T. Hill, Surveyor to the Earl of Stamford, Ashton-under-Lyne, where tenders until Sept. 30.

CEMETERY AND CHAPELS, Dundee.—Laying out the ground, forming roads, walks, fencing, draining, and turfing. Plans, &c., Mr. Browning, architect, Stamford. Tenders, Sept. 30. Also two chapels, with lodge, entrance gates, &c. Particulars, Mr. Browning, to whom tenders, Sept. 30.

PARSONAGE, Shropshire.—The time for receiving tenders for Amblesote Parsonage is extended to Sept. 26, when they must be delivered to the Rev. J. W. Grier, Stour-bridge.

CHAPEL AND SCHOOLS, Burnley.—New Congregational chapel, and foundation of the schools. Drawings, warehouse of Messrs. Lomas and Bowen, on and after Oct. 5. Each tender to be for the whole works. Quantities free, Messrs. Bateson and Hunt, 11 Park-street, Westminster, to whom application for copies forthwith. Tenders addressed to Mr. H. J. Paull, architect, Cardiff, care of Messrs. Lomas and Bowen, Burnley.

SCHOOLS AND TRACHER'S HOUSE, Redditch.—For the Wesleyan denomination. Plans and specifications, Rev. E. Shelton, Redditch; to whom tenders, Oct. 4. Architect, Mr. J. Wilson, Belmont, Bath.

MANSION AND OFFICES, Scotland.—At Drumpark, seven miles from Dumfries, for F. Maxwell, Esq. Plans, &c., at the chambers of Mr. J. McKie, writer, Dumfries. Tenders, Mr. J. Cunningham, architect, Liverpool, Oct. 1.

FOUNDATIONS, ASSIZE COURT, Manchester.—For the brickwork and masonry required in the foundations of the Manchester Assize Courts. Drawings, &c., and bills of quantities on application at the office of Mr. A. Waterhouse, architect, Cross-street Chambers, Manchester. Tenders Sept. 29.

PURCHASE OF EMERY STONE, Greece.—For the purchase of a quantity not exceeding 25,000 quintals of Naxos Emery Stone. Tenders and personal attendance or by deputy at St. Pantelimon-place, Athens, from 9 to 12, Oct. 1. Previous deposit of 10,000 drachmas in the National Bank of Greece. Full particulars by personal application at the office of the Consulate General of Greece, London.

PLANS FOR LAYING OUT GROUND, Scotland.—For the best method for laying out for building purposes part of the estate of Granton, near Edinburgh, the property of his Grace the Duke of Buccleuch and Queensbury. Also plans for the different classes of houses proposed to be erected. For the most approved plan a premium of £75, for the second, £50, and for the third, £25. Plan of the ground and all particulars by personal application to Mr. Hawkins, C.E., Granton Harbour, between 11 and 1 o'clock. Where also there are printed copies of the conditions. Plans to Messrs. Gibson, W.S., No. 12 Charlotte-street, Edinburgh, March 1.

MOLDERS' FOREMAN.—Wanted in an iron foundry a working foreman who understands both sand and loam moulding. A good character indispensable. Apply to Messrs. Wallis and Robinson, engineers, 258 Euston-road, London, N.W.

RAILWAY WAGON MAKERS.—A foreman and several workmen and coach-makers. J. L., care of Mr. B. Wheeler, news-agent, Manchester.

HYDRAULIC ENGINEERS' FOREMAN.—To take instructions, make and set out plain working drawings, and attend to work in progress. One experienced in pump work preferred. Address, with salary expected and "very full particulars," to J. T. H., Engineer office, 163 Strand, W.C.

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR
Private Residences, Farm Buildings, Churches, Chapels,
Railway Stations,
And all isolated places not yet lighted with Gas.

The various apparatuses are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln. (346)

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

IN all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,

Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (349)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Prince's-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (148)

FOR INVALIDS.—INDIA-RUBBER

WATER BEDS, PILLOWS, and CUSHIONS. Also Inflating Bed-chairs, Air Beds, Pillows, Bolsters, and Air Cushions made any size or design. Price Lists post free on application.—JAMES LYNE HANCOCK, Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (257)

RANSOMES PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c.

—By this process the softest and most friable Stone, Cement, or Stucco, can be rendered Impervious and Imprescriptible, DECAT AT ONCE ARRESTED AND PREVENTED. For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (175)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Crushers, Post Mills, Pumps, Weighing Machines, Corn Blends, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered. Price £27 10s. per ton, £1 10s. per cwt.; samples of 25 lbs. forwarded on receipt of 5s. Packages free.

Address—**THE PATENT PLUMBAGO CRUCIBLE COMPANY,** Battersea Works, London, S. W. (334)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

To Engineers, Railway, Water, and Gas Companies, Iron Ship and Bridge Builders, Marine, Locomotive and Stationary Boiler Manufacturers, &c., Brewers, Distillers, Sugar Refiners, &c.

WARNE'S

NEWLY PATENTED

FERRUGINOUS CEMENT PACKING,

IN SHEETS AND WASHERS,

Applicable to Steam, Water, Air, and Gas Joints of all descriptions, in place of Iron Cement, Sheet Lead, Red and White Lead, Gasket, Millboard, &c.

1. To Cylinder, Air and Vacuum Pump Covers and Doors, Condensers, hot and cold Liquor Pumps, Valve Covers, Steam and water flange and socket pipe joints, Man and Mud-Hole joints, to Cast Iron Tanks, and to repairs of Marine, Locomotive, and Stationary Boilers, &c.
2. To RAILWAY purposes, to the bedding of Rails, Chairs, and fish joints, to the bedding and adjusting of Girders and Turn Tables to the construction of Iron Burmah and of Iron Shafts, and to bedding Marine Boilers on Bearers, &c., &c.
3. To Gas Mains and Pipes, Retort joints, to the construction of Gasometers and Gasholders, &c., &c.
4. To all joints of Steam, hot and cold Liquor Pipes and Pumps for Brewers, Distillers, Sugar Refiners, Chemical Manufacturers, Tanners, Dyers, and in fact all uses where the common Iron Cement, Lead, or other joint has been hitherto applied.

The important advantages of the PATENT FERRUGINOUS CEMENT PACKING consists in the *Indestructibility* of the material, either by Fire, Steam, Water, or Gas—in its *instant and ready application*—and in its great economy of time and labour in making joints, in place of the ordinary Iron Cement. For all permanent joints (elastic before its application) it can be made to set as hard as Iron, and it will expand and contract in the same ratio as the Metal; while, for all other joints, it can be made sufficiently elastic to answer all the purposes of India-rubber or other Packing.

Directions for Use.—Immediately before use, the Patent Ferruginous Packing, when intended for permanent joints, should be pickled for at least six hours in a solution of Sal Ammoniac—1 lb. to a pint of Water; when not intended for permanent joints, the pickling is not necessary.

Sole Manufacturers—**WILLIAM WARNE & CO.,**

9 Gresham-street-west, E.C.—Mills, Tottenham, N. (340)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

FOR CORRECT FAMILY ARMS, CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y paris France, Italian, Almond, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheapside.—No charge for the Dies. (322)

WATER GLASS, or SOLUBLE SILICATES OF SODA or POTASH, in large or small quantities, and either Solid or in Solution, at ROBERT RUMNEY'S, Ardwick Chemical Works, Manchester. (333)

THE ADVERTISER is desirous of an Engagement as CLERK in a Patent and Designs Office. Having devoted some years to such a Business, and from an extensive acquaintance with Inventors and Inventions, he is qualified to prepare all papers, titles, and ordinary Specifications pertaining to Provisional and Complete Protection, and to discharge the duties of a Patent Agent in the absence of the Principal. Address—"THURRO," Post-office, Birmingham. (327)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. SPENCER, READ, & CO., 4 Abchurch-lane, Strand, W.C. (336)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S. E.

LONDON,

(15)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK.

Beq respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel are as stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

V.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at LEISTON WORKS, SAXMUNDHAM, SUFFOLK.

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invites the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTERS, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS; Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batswings, &c.; IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS, AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYAN'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliere, &c., with complete Book of Prices, 12s.

(204)

MEDALS AWARDED TO

THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.

AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to dupe the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskilfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,

PATENT DRY GAS-METER MANUFACTURER,

SUFFOLK STREET, CLERKENWELL GREEN, AND

ALLEN STREET, GOSWELL STREET, E.C.

(205)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury near Birmingham, where all communications are requested to be sent.

(275)

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY,

AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

as inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c., &c. (275)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—60 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

TO MECHANICS.

WHO'S YOUR TAILOR?

Try MORDAUNT'S for GOOD and CHEAP CLOTHING,

13 CANNON-ST., LONDON BRIDGE.

(342)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 5 to 150 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTOR AND ENGINEERS.

2 John-Street, Minories, London, E.C. Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (180)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Waggon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)

15 Wellington-street North, Strand, London, W.C.

(270)

EMIGRATION TO NEW YORK, CANADA,

AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 25 Bath Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon. Free to Railway on receipt of Order or Remittance. (200)

RUSTON, PROCTOR, AND CO.,
LINCOLN; AND KENNET WHARF, 67 UPPER THAMES STREET, LONDON;
AGRICULTURAL ENGINEERS AND MILLWRIGHTS.

MANUFACTURE

PRIZE PORTABLE and FIXED STEAM ENGINES,
 SMITH'S PATENT STEAM PLOUGHS,
 PATENT PRIZE COMBINED THRASHING MACHINES,
 containing E. P. and Co.'s New PATENT CORN
 CLEANER,
 SAWING MACHINERY, CIRCULAR and VERTICAL of all
 Sizes,
 MILLS of all Kinds, FIXED and PORTABLE, for Grind-
 ing Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(84)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from

PERENNIAL AND ITALIAN RYE GRASS, &c.,
 AND
SCOTT'S PATENT CARROT SEED BEARDING
 AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
 which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by
 drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative
 per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and
 important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Ruston Square
 London, N.W.

TRACTION ENGINES,
 (BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,

ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and
 South America, may now be seen, com-
 plete and in course of construction at the
 above works. BOYDELL'S TRACTION
 ENGINES AND ENDLESS RAILWAY will
 draw heavier loads over good roads than
 any other traction engine, and on soft
 and bad roads will draw heavy loads
 where no other traction engine can move
 itself. All objection to the wear and
 tear of these Engines is entirely re-
 moved by the use of Charles Burrell's
 improved patent Wrought Iron Wheels,
 fitted with Rails and Tyre, as well as all
 the wearing parts, of Steel.

47 Apply also to Mr. Hemming,
 Mark Lane, E.C.

(40.)

CLAYTON, SHUTTLEWORTH, AND CO.,
 OF LINCOLN,
 78 LOMBARD STREET, LONDON, E.C.,
 AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
 And Manufacturers of Portable and Fixed Steam Engines.

Combined Thrashing Machines, which dress the corn ready for market at
 one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and
 Mining purposes, with all necessary gearing for being driven by steam power.
 Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every
 purpose to which steam-power can be applied. When intended for winding,
 they are fitted with reversible link motion and winding gear. They are
 easily removed, as may be seen by the engraving, and can be set to work
 immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business,
 and are prepared to send off engines and machinery of the before-mentioned
 kinds in a few days from the date of order. They would also call attention to
 the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants,
 Shippers, and Colonial Agents.

(23)

CHADBURN BROTHERS'
PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years,
 and have given general satisfaction. Those first fixed are
 now in as good working condition as ever. Testimonials,
 &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of Messrs. Elliott Bros., Strand;
 Mr. Fenn, Newgate-street; Messrs. Dring and Fagg,
 Toolcy-street; Messrs. Nigretti and Zambra, Holborn.

A COURSE OF SIX LECTURES ON
SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock.
Tickets will be issued at 5s. each for the course, or 1s. each Lecture, at South Kensington.
By order of the Committee of Council on Education.
(331)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 44 in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lilford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five.
(333)

MACHINERY of all kinds **DRAWN** and **ENGRAVED** ON WOOD, with the greatest accuracy of detail and Artistic Effect, by
L. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required.
(343)

SELF-ACTING VALVE REGULATORS,

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the Kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRBANKS and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM
"TROTMAN'S PATENT ANCHOR"
to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 23 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE
Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a regulation from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and takes the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his office, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin.
18th May, 1859.
(264)

THE IMPERIAL IRON TUBE COM-

PANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham.

Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes.
(347)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week.
(77)

WANTED, by a Young Man, an Engagement as Mechanical Draughtsman, or to superintend work at home or abroad. Has had thoroughly practical experience. Good Testimonials from former employers.
Address A. W., 22 Richmond-road, Barnsbury, N. (352)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE
POCKET STEREOSCOPIC PANORAMA,
FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at
P. C. LAMBORN'S,
85 King William-street, City.
(345)

KENNINGTON AGRICULTURAL AND
CHEMICAL COLLEGE, Lower Kennington-lane, near London.

PRINCIPAL.—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College.
(320)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 106 Fleet-street, London.
(316)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR AND SONS,

OIL MERCHANTS,

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street.
(23)

J. W. CLARE, C.E., Inventor of the Patent

Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E.
(344)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS

and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.

SPENCER, READ, & CO., 4 Agar-street, Strand, W.C. (100)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER, Farmer, Hatfield, Herts.

ILLUSTRATED CATALOGUES WITH PRICES, WILL BE READY SHORTLY. (215)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description of

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

Is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (59)

FAHRAR'S

PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,

BATTERSEA WORKS, LONDON, S.W. (313)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWINNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWINNE & CO., Engineers, Essex-street Wharves, Strand, W.C., London. (351)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address GEORGE RICHARDSON and CO.,
New Broad-street, E.C. (27)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 30in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (294)

44 St. Paul's Churchyard, London, E.C. (308)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON's and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

166 FLEET STREET, LONDON, E.C. (16)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor*.

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works,
108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected.

Every Variety of Gutta Percha Article.

NOTICES.

The MECHANICS' MAGAZINE will be sent free by post to all subscribers of \$1 in. 6d., annually, payable in advance. Post Office Orders to be made payable to E. A. Brooman, at the Post Office, Fleet Street, London, E.C.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 52 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

The demand for Mr. E. J. REED'S paper—

ON THE MODIFICATIONS WHICH THE SHIPS OF THE ROYAL NAVY HAVE UNDERGONE DURING THE PRESENT CENTURY, IN RESPECT OF DIMENSIONS, FORM, MEANS OF PROPULSION, AND POWER OF ATTACK AND DEFENCE,"

has been so great that the Journal of the Society of Arts, the MECHANICS' MAGAZINE, and all other Scientific Journals in which it appeared in December last, are now out of print. The demand still continuing, it has been deemed desirable to reprint it in a separate form. An 8vo. edition of it, in large type, and on fine paper, has, therefore, been prepared, and may now be had at the Office of this Magazine, price 1s.

LIST OF NEW BOOKS.

Burne's Illustrations of Joinery. 3s.

James's Naval History of Great Britain, Vol. VI., 6s.

LIST OF MISCELLANEOUS TENDERS IN VITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

RAILS FOR SALE, Scotland.—The directors of the Glasgow and South Western Railway Company are prepared to sell by tender 2,500 tons of malleable iron rails. Delivery will be given at the Glasgow Station, Shields Junction, Ayr, Troon, or Ardrossan, in quantities to suit purchasers. Information, Manager's office, Bridge-street, Glasgow; where tenders, Oct. 3.

TELEGRAPH CABLE.—The Lords of Committee of Privy Council for Trade will receive tenders for manufacture of outer covering and laying of a submarine telegraph to Gibraltar. Copies of specification, Board of Trade, Whitehall; or at the offices of Messrs. Glsborne and Forde, engineers, 6 Duke-street, Adelphi. Tenders, Secretary Board of Trade, marked "Tender for Falmouth and Gibraltar Telegraph," Oct. 8.

RESERVOIR, Merthyr Tydfil.—For the formation of a large storage reservoir (of about 100 acres area) and other works, in the valley of the river Taff Fechan. Drawings and specifications inspected, and bills of quantities obtained on payment of 50s., at Mr. J. W. Russell, Clerk to the Local Board of Health, Merthyr Tydfil; and at the office of Mr. Hawkey, Civil Engineer, 30 Great George-street, Westminster, Oct. 3. Tenders at Mr. Russell's office, Oct. 19.

PIER, Queenborough.—The directors of the Sittingbourne and Sheerness Railway Company advertise for tenders for construction of pier at Queenborough, in the Isle of Sheppey. Drawings, specifications, and forms, at the office of Mr. J. C. Birkenshaw, 22 Abingdon-street, Westminster. Tenders, Mr. S. J. Breeze, Secretary, 51 King William-street, London, E.C., Oct. 10.

RAILWAY WORK, Lancashire and Yorkshire Railway.—For the extension of warehouse and other works at the Halifax station. Plans, specifications, and quantities at engineer's office, Hunt's Bank, Manchester, where forms of tender; and to which place tenders must be sent by 10 a.m., Oct. 4, to Mr. W. S. Lawn, Secretary.

LOCK AND LOCK FURNITURE, Navy.—For supplying Her Majesty's Dockyards under a contract for twelve months certain, and afterwards until after the expiration of three months' notice. Patterns and particulars, Somerset Place. Tenders, two o'clock, Oct. 11, with two sureties for £1,000.

LAYING ON GAS, London.—For repairing and laying on gas to Beaufort House for the Committee of the South Middlesex Volunteer Rifles, North End, Fulham. Specifications at Beaufort House. Tenders, 8 p.m., Oct. 4.

CHURCH, Draycot, Somersetshire.—Parish of Chiddar. Drawings, Rectory, Rodney-stoke, till Oct. 3. Tenders there Oct. 4.

RESTORATION, Fennyntanton.—Interior of the parish church. Plans, &c., at the office of Mr. B. Hutchinson, architect, Market-place, Huntingdon. Tenders, Oct. 4.

CHAPEL AND SCHOOLS, Stokes-croft.—Plans, vestry, Baptist Chapel, Pithay. Particulars, Messrs Midland and Maberly, architects, Clarence-street, Gloucester. Tenders, Oct. 11.

SCHOOL, Swindon.—For a new school and teacher's residence at Lydiard Treday, near Swindon. Apply at Mr. E. Mantell, architect, Swindon.

SURVEY, Caster Union.—For the making of a survey with plan of the messuages, lands, and hereditaments liable to poor rates in the parish of Market Rasen, in the Caster Union, and also for making a valuation of the said messuages, lands, and hereditaments, according to their annual value. Scale, 3 chains to an inch. Population last census, 2,110; area, 1,220 acres. Tenders, Mr. H. Daubney, Clerk to the Union, Caster, Oct. 7.

DESIGNS FOR GUILDHALL, Cambridge.—And other public buildings. To be erected at present at not exceeding £8,000; an assembly room, free library, and reading room, town clerk's offices, and rooms for the school of art. £200 for the best, and £100 for the second best design. Printed particulars, Mr. C. W. Cooper, Town Clerk, Cambridge, to whom designs, Oct. 31.

PLANS FOR CEMETERY, Over Darwen.—With three chapels and entrance lodge. Total expense to be £1,000. Best plans to carry out the work at 25 per cent., second best a premium of £20, and third best a premium of \$10. Plans, &c., Mr. T. Clough, Clerk to the Burial Board, Over Darwen, Lancashire, Oct. 17.

PLANS FOR HARTLEY INSTITUTION, Southampton.—Expense of building not to exceed £8,000. The author of the approved plan to be the architect. Information Mr. C. E. Deacon, Town Clerk, Southampton. Plans, Dep. 1.

MECHANICAL DRAUGHTSMAN.—One accustomed to engine work and able to make neat drawings. Immediately. M. E., Messrs. Spon, Booksellers, Bucklersbury, E.C.

MECHANICAL DRAUGHTSMAN.—Capable of making both finished and working drawings. One accustomed to the direction of men preferred. S. T., Messrs. Battal and Son, Ebury-street, Piccadilly, stating salary required.

FOREMAN MILLWRIGHT.—For the pattern room of an engineer and millwright's work. To draw out original designs for the workmen. Box 63, Preston.

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

IN all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,
Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (319)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY AND COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Bruisers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Handsome Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.
Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W. (334)

BALLOONS or Boats Driven by Steam.—

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell.

These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

BIRMINGHAM WAGGON COMPANY

(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (376)

WATER GLASS, or SOLUBLE SILICATES OF SODA or POTASH, in large or small quantities, and either Solid or in Solution, at

ROBERT RUMNEY'S, Ardwick Chemical Works, Manchester. (335)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln. (316)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

To Engineers, Railway, Water, and Gas Companies, Iron Ship and Bridge Builders, Marine, Locomotive and Stationary Boiler Manufacturers &c., Brewers, Distillers, Sugar Refiners, &c.

WARNE'S

NEWLY PATENTED

FERRUGINOUS CEMENT PACKING,

IN SHEETS AND WASHERS,

Applicable to Steam, Water, Air, and Gas Joints of all descriptions, in place of Iron Cement, Sheet Lead, Red and White Lead, Gasket, Millboard, &c.

1. To Cylinders, Air and Vacuum Pump Covers and Doors, Condensers, hot and cold Liquor Pumps, Valve Covers, Steam feed and water flange and socket pipe joints, Man and Mud-Hole joints, to CAST IRON TANKS, and to repairs of Marine, Locomotive, and Stationary Boilers, &c.

2. To RAILWAY purposes, to the bedding of Rails, Chairs, and fish joints, to the bedding and adjusting of Girders and Turn Tables—to the construction of Iron Bridges and of IRON SHIPS, and to bedding Marine Boilers on Bearers, &c., &c.

3. To Gas Mains and Pipes, Retort joints, to the construction of Gasometers and Gasholders, &c., &c.

4. To all joints of Steam, hot and cold liquor Pipes and Pumps for Brewers, Distillers, Sugar Refiners, Chemical Manufacturers, Tanners, Dyers, and in fact all uses where the common Iron Cement, Lead, or other joint has been hitherto applied.

The important advantages of the PATENT FERRUGINOUS CEMENT PACKING consists in the Indestructibility of the material, either by Fire, Steam, Water, or Gas—in its instant and ready application—and in its great economy of time and labour in making joints, in place of the ordinary Iron Cement. For all permanent joints (elastic before its application) it can be made to set as hard as Iron, and it will expand and contract in the same ratio as the Metal; while, for all other joints, it can be made sufficiently elastic to answer all the purposes of India-rubber or other Packing.

Directions for Use.—Immediately before use, the Patent Ferruginous Packing, when intended for permanent joints, should be pickled for at least Six Hours in a solution of Sal Ammoniac—1 lb. to a pint of Water; when not intended for permanent joints, the pickling is not necessary.

Sole Manufacturers—

WILLIAM WARNE & CO.,
9 Gresham-street-west, E.C.—Mills, Tottenham, N. (319)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ARCHBUTT, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routhledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

FOR CORRECT FAMILY ARMS,

CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parle Français, Italien, Allemand, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheapside. No charge for the Dies. (322)

GRESHAM'S

RECORD

PATENT

BUOY.

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to distinguish it from any other floating substance, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within, it has raised conspicuously upon its surface a SILVERED GLOBE, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make SPECIAL RECOGNITION OF THESE EXPEDITED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has Patented his Invention, and has arranged with the old-established Firm of

GEORGE AND JOSEPH OLIVER,

286 WAPPING, LONDON, E.,

TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD BE ADDRESSED. (202)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.	} From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.
SELF-PROPELLING AND TRACTION ENGINES.	
STONE GRINDING MILLS.	
MORTAR AND PUG MILLS.	
MILLWRIGHTS' WORK of all kinds.	
SAWING MACHINERY, from 4 to 20 Horse Power.	
BRICK AND TILE MACHINES.	

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
 PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
 THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
 CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
 BARLEY AVELLING MACHINES.
 CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
 PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
 PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
 PRIZE SEED AND MANURE DRILLS.
 LIQUID, SEED, AND MANURE DROP DRILLS.
 CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
 GARRETT'S PATENT HORSE HOE for all Crops.
 PATENT REVOLVING HOES for Root Crops.
 IMPROVED PLOUGHS AND REAPING MACHINES.
 &c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & Sons' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS.

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 60 PRINCES STREET, LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASSEMENT FASTENING AND SILL-BARS

are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (135)

Important to every man who keeps

THORLEY'S FOOD FOR CATTLE,

77, NEWGATE STREET, LONDON

Price 50s. per Cask, containing 448 Feeds

Carriage paid to any Station.

A Pamphlet, Post-free on application. (132)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S

LONDON RACK CORK SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlery and Ironmongers'. (24)

RICHARD GARRETT AND SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Do respectfully to call attention to their

**NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING,
THRASHING, AND DRESSING MACHINES.**

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel are stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

F.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK. 314

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invite the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

**GAS CHANDELIERS, GLASS LUSTRES, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batwings, &c.;**

IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

**CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS,
AND COMPOSITION TUBING.**

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.

Sole Manufacturers of CHURCH & MANN'S PHOTOMETER.

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s. (294)

MEDALS AWARDED TO

THOMAS GLOVER'S PATENT DRY GAS-METERS.

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.

AND PARIS UNIVERSAL EXHIBITION, 1855.

LONDON, March 25, 1859.

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his PATENT DRY GAS-METERS since the dissolution of his partnership with Mr. Croll than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above 12,500 of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,

PATENT DRY GAS-METER MANUFACTURER,

SUFFOLK STREET, CLERKENWELL GREEN, AND

ALLEN STREET, GOSWELL STREET, E.C. (293)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent; (278)

**GLENFIELD PATENT STARCH,
USED IN THE ROYAL LAUNDRY,**

AND PROHOUNCED BY HER MAJESTY'S LAUNDRESS
TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

as inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c., &c. (78)

VINEGAR.—Patronised by Her Majesty's Government.

**CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.**

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-Street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (716)

TO MECHANICS.

WHO'S YOUR TAILOR?

**Try MORDAUNTS for GOOD and CHEAP
CLOTHING,**

13 CANNON-ST., LONDON BRIDGE. (342)

**ARTESIAN WELLS, BORING TOOLS,
PUMPS, &c.** Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

**GLADSTONE & Co., CONTRACTOR
and ENGINEERS.**

2 John-Street, Minories, London, E.C.,

Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (198)

**YORKSHIRE TYRE & AXLE WORKS,
ROTHERHAM.**

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

**PATENT WOOD OR FIBROUS SLAB COMPANY,
(Limited)**

15 Wellington-street North, Strand, London, W.C. (270)

**EMIGRATION TO NEW YORK, CANADA,
AUSTRALIA, NEW ZEALAND, EAST INDIES,
CAPE OF GOOD HOPE, &c.** All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. 243

**CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT,**

Not only Deodorises but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in laundries, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (339A)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

**GAS STREET AND BERKLEY STREET,
BIRMINGHAM,**

**Manufacturers of Wrought Iron Tubes & Fittings,
FOR GAS, STEAM, AND WATER.**

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

(193)

**SCOTT'S
PATENT GRASS SEED SEPARATOR,**
which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,

AND

SCOTT'S PATENT CARROT SEED BEARDING

AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,

which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Foston Square
London, N.W.

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easily removed, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

(23)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimation pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W.

CHADBURN BROTHERS'

PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield.

The Gauges may be had of all respectable Ironmongers in the country.

NOTICE TO MACHINE MAKERS, BRICK AND TILE MAKERS.

INFRINGEMENTS ON PATENTS.

I HEREBY GIVE NOTICE, that the Prize Brick-Making Machine lately Exhibited at Warwick by Mr. John Whitehead, of Preston, Lancashire; and since Advertised by him, is a Direct Infringement upon the Patents granted to me, Henry Clayton (13th December, 1852, No. 1045, and 8th October, 1853, No. 2312), and that proceedings are being taken against him. In the meantime, Purchasers or Users of the Machine are cautioned that they will expose themselves to Proceedings for an Infringement of the said Patents.—Dated 29th September, 1859.

HENRY CLAYTON,

Patentee and Engineer, Atlas Works, Upper Park-place, Dorset-square, London.

Solicitors, Messrs. Wilson & Bairstows, London. (357)

A COURSE OF SIX LECTURES ON SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock. Tickets will be issued at 5s. each for the course, or 1s. each Lecture, at South Kensington.

By order of the Committee of Council on Education. (351)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (356)

BESSEMER STEEL—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 24th of June last. (363)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4s. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lilford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (355)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Mundaŷ, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this invention the First Class Medal, 1855.

JOHN TROTMAN, PATENTEE, 42 CORNHILL, LONDON. (249)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING

applicable to Steam, Air, Water, and Gas joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE AND CO., India-rubber Manufacturers, 9 Gresham-street West, E.C. MILLS—Tottenham, N. (360)

HART & SON, MALLEABLE IRON.

FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE Office, 160 Fleet-street. (361)

ESTABLISHED 1700.

WINDOW BLINDS.—GEO. F. JAMES

and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with despatch. Experienced Workmen sent to any part of the kingdom. (355)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate

Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E. (362)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE POCKET STEREOSCOPIC PANORAMA.

FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S, 85 King William-street, City. (345)

KENNINGTON AGRICULTURAL AND

CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBITT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.

—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Doxen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 160 Fleet-street, London. (316)

SELF-ACTING VALVE REGULATORS,

Registered No. 4064.

THE simplest and most effective Ventilator

in use, to be fixed in the external walls of buildings.

Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRB and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory.—55A HOLYWELL-ST., MILLBANK, S.W., LONDON. (358)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at
CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and
FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing,
as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-
ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE,
ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved
AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN
FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminence of excellence of which is fully attested by the numerous Prizes which have been awarded to them in the
United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400
value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry
of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals
at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of
Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the
Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent
Free by Post on application to

R. HORNSBY AND SONS,
SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British
Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their
PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any power, and the Plough can be made to take any kind of
apparatus necessary for Cultivating the Soil, such as Scarifier, Rines or Broad Shares, &c. Any Engine now used by
farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or
four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be
used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and
simple, and generally useful.

For further Information apply to
ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER, Farmer, Hatfield, Herts.

A Complete set of Tackle will be Exhibited on the 12th inst., at the Long Sutton Agricultural
Show, by Mr. DRING, of Gidneymarsh, near Long Sutton. (215)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

RAILWAY PLANT AND IRONWORK.
NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

**TO STEAM SHIP OWNERS, ENGINEERS, AND
OTHERS.**

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for
ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate
the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is
effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials
from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It
is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of
water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water.
An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (80)

FARRAR'S PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without
Cementation.

For Licenses to use Process and further Particulars,
apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

GREAT REDUCTION IN THE COST OF STEAM
POWER.

THE temperature of the products of burnt
fuel escaping into the Smoke-boxes of Locomotive
and Portable Engines is upwards of 800°. DUNCAN,
GWYNNE, and C. WYE WILLIAM'S PATENT HEAT
DIFFUSERS, placed in the Tubes, will utilize about 400°
of the heat, convert it into an equivalent of working steam,
and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part
of the value of the fuel saved by the use of their simple
appliances.

Every information may be had on application to the
Manufacturers, GWYNNE & CO., Engineers, Essex-street
Wharves, Strand, W.C., London. (351)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED
BRASS AND COPPER TUBES, now extensively
used on the principal Home and Foreign Railways, and
for Marine Boilers by the Government and leading Steam-
Packet Companies, are cheaper and more durable than the
ordinary tubes.

Address **GEORGE RICHARDSON and CO.,**
New Broad-street, E.C. (277)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufac-
ture and finish, and are to be sold at very low prices.

Apply to **PAGE and CAMERON, 64 Old Broad-street,**
London, E.C. (261)

ENGINEERS' TOOLS FOR SALE.—A
Superior SELF-ACTING SLIDE and SCREW-CUT-
TING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in.
centre and 9 ft. bed. A PUNCHING and SHEARING
MACHINE, for 8 in. plates. Two Ditto for 4 in. plates,
and Two Ditto for 3 in. plates. VERTICAL DRILLING
MACHINE; PILLAR and BENCH DRILLS; HALEY'S
and other LIFTING JACKS; RATCHET BRACES, &c.
Apply to **PAGE and CAMERON, 64 Old Broad-st., E.C.,**
London. (255)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES
LEITCH, Gunmaker, 68 Margaret-street, Regent-street,
and by Daw, of Broad-street. (371)

TO INVENTORS.

INDIA-RUBBER APPARATUS OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE
BANDING IS NOT AFFECTED BY WET, HEAT, OR COLD;
does not stretch nor slip on the pulleys. HOSES for
BREWERIES, &c., will not impart TASTE, SMELL, or
COLOUR: also for conducting, or steam purposes. Washers,
Valves, Sheets, Printing Blankets, &c., in Stock. Other
Articles made to order. All Goods warranted to stand
300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of
the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co.,
44 St. Paul's Churchyard, London, E.C. (306)

SCOTT'S
PATENT GRASS SEED SEPARATOR,
 which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
 and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,
 AND
SCOTT'S PATENT CARROT SEED BEARDING
 AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
 which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Fuston Square London, N.W.

CLAYTON, SHUTTLEWORTH, AND CO.,
 OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

Engines purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

 Implements forwarded post free upon application. (316)

CLEGG ON COAL-GAS.
Now ready, price £1 11s. 6d., cloth, the Third Edition, greatly enlarged, and with numerous additional illustrations, of

A PRACTICAL TREATISE ON THE MANUFACTURE AND DISTRIBUTION OF COAL-GAS, its Introduction and Progressive Improvement. Illustrated by Engravings from Working Drawings, with General Estimates. By SAMUEL CLEGG, Jun., M. Inst. C.E. London: JOHN WEALE, 59 High Holborn. (358)

NEW PRACTICAL WORK BY PROFESSOR RANKINE.

One Volume, Crown 8vo., 12s. 6d., Cloth.
THE STEAM ENGINE, AND OTHER PRIME MOVERS. By WILLIAM JOHN RANKINE, LL.D., C.E., F.R.S., &c., Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. Illustrated with numerous Engravings from Original Drawings.

SYNOPSIS.
HISTORICAL ESSAY.—Origin and Progress of the Steam Engine.

INTRODUCTION.—Mechanical Principles applicable to all Prime Movers—Work and Energy—Power—Efficiency—Indicators and Dynamometers—Brakes—Fly Wheels—Governors—Principles of the Strength of Machines.

PART I.—Of Muscular Power—Power of Men—Power of Horses and other Beasts.

PART II.—Of Water Power and Wind Power—Water Pressure Engines—Water Wheels—Turbines and Vortex Wheels—Windmills.

PART III.—Of Steam and other Heat Engines—Phenomena of Heat—Combustion and Fuel—Efficiency and Economy of Furnaces and Boilers—Principles of Thermodynamics (or the Science of the Relations between Heat and Mechanical Energy)—Application of those Principles to the Action of Steam and other Fluids in Driving Engines—Efficiency of those Engines when driven by Air—by Saturated Steam—by Superheated Steam—by Steam and Ether—Various Forms and Arrangements of Furnaces and Boilers—Stationary, Marine, and Locomotive Mechanism of Steam Engines—Cylinders and Pistons—Valves—Valve-gearing Pumps—Various arrangements of Mechanism in Stationary, Marine, and Locomotive Engines, &c., &c.

PART IV.—General Principles of Electro-magnetic Engines.

APPENDIX.—TABLE of the Properties of Steam and other Substances, and of Numbers useful in Calculations respecting Steam Engines and other Prime Movers.

London: RICHARD SHIPPIN & Co., Stationers'-hall-court; and Glasgow. (359)

IMPORTANT TO MANUFACTURERS MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oil, grease, acids, alkalis, or water—and the facility with which the only joint required can be made in bands of from 300 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the failing of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Ferry Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patentes,

SPENCER, READ, & Co., 4 Agar-street, Strand. W.C. (90)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines.

To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

Price List of Gauge Fittings, &c., on application. (9a)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed), Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princes-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

TO WIRE ROPE MAKERS.—ARCHIBALD SMITH is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 69 Princes-street, Leicester-square, W. (198)

FOR DRIVING MACHINERY, MILLS, &c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

JAMES LYNE HANCOCK,

Vulcanised India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (256)

RANSOME'S PATENT IMPERISHABLE SILICEOUS STONE.—Chimney-Pieces, Ballustrades, Capitals, Trusses, Terminals, Fountains, Vases, Monuments, &c., of great beauty, at the most reasonable prices.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (147)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.

13 DOCK-STREET, DUNDEE. (280)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY, Battersea Works, London, S.W. (334)

BALLOONS or Boats Driven by Steam.—

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell.

These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

MACHINERY of all Kinds DRAWN and ENGRAVED on WOOD, with the greatest accuracy of detail and Artistic Effect, by

L. WALMSLEY, 2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

EDWIN JEWITT, ENGRAVER ON WOOD AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (84)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL,

10½ ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c.—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-st. West, London, E.C.—C. M. and Co.'s only Establishments. (139)

ISCA FOUNDRY COMPANY, OLD BARRACKS, NEWPORT, MON.

ENGINEERS, AND RAILWAY WAGON BUILDERS. Manufacturers of Switches, Points, and Crossings, Chairs, Spikes, Bolts, and General Railway Fittings. (279)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New), beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857), 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858), 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

THE IMPERIAL IRON TUBE COMPANY (Successors to GEORGE B. LLOYD and Co.),

Gas-street and Berkley-street, Birmingham,

Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (271)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.

LONDON.

(15)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING,
THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

F.B.—Catalogues in English, French, or German can be obtained *free*, on application being made to **R. G. & SONS**, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK. 314

D. HULETT & CO.,

55 and 56 HIGH HOLBORN, LONDON,

Patentees and Manufacturers of the only good Mercurial Gas Regulator,

Invite the attention of Gas Companies and the Trade generally to their Improved GAS-METERS, which they warrant equal to any in Quality, Workmanship, and Simplicity of Construction, and the only Meters from which Gas cannot be obtained without being duly registered.

Manufacturers of

GAS CHANDELIERS, GLASS LUSTRES, HALL LANTERNS, VESTIBULES, BRACKETS, PENDANTS;
Double Cone, Albert, Shadowless, and every description of Burner, Union Jets, Batswings, &c.;
IMPROVED FULL-WAY CARTER'S VALVES (much approved of);

GAS-STOVES, and every article connected with Gas-Apparatus.

CAST AND WROUGHT-IRON PIPE, BLACK AND GALVANISED. COPPER, TIN, BRASS,
AND COMPOSITION TUBING.

D. HULETT'S IMPROVED SERVICE CLEANSER,

for clearing out Mains, Services, and Interior Fittings—60s. net.

BOYLE'S PATENT SILVERED GLASS COMBINATION REFLECTORS AND OUTSIDE LANTERNS.Sole Manufacturers of **CHURCH & MANN'S PHOTOMETER.**

Large Pattern Books, with every description of Gas-Fittings, Chandeliers, &c., with complete Book of Prices, 12s.
(294)

MEDALS AWARDED TO**THOMAS GLOVER'S PATENT DRY GAS-METERS.**

VIZ.:

GREAT EXHIBITION, LONDON, 1851. | NEW YORK EXHIBITION, 1855.**AND PARIS UNIVERSAL EXHIBITION, 1855.***LONDON, March 25, 1859.*

THOMAS GLOVER takes this opportunity of thanking Gas Companies and his other Customers for the very liberal support and patronage he has received during the past year, which has far exceeded his most sanguine anticipations, having sold a greater number of his **PATENT DRY GAS-METERS** since the dissolution of his partnership with **Mr. Croll** than he was ever previously enabled to do in any one year.

THOMAS GLOVER confines his sole attention to the business of Gas-Meter Making. The propriety of his doing so is satisfactorily proved by his success; and, without the practice of any quackery, or any attempt to delude the public by an absurd exhibition of "Old and New Valves," his Meters are in general use by the Metropolitan Gas and other Companies in this Country and abroad. For example, one Metropolitan Company have now in use above **12,500** of his Patent Dry Gas-Meters; some of these Meters have been fixed for Fourteen Years, and are still in working order, without complaint from either the Company or the Consumer.

THOMAS GLOVER thinks it necessary to put Gas Companies on their guard against parties selling Patent Dry Gas-Meters constructed in imitation of his, but unskillfully made on erroneous principles, and with improper and unsuitable materials.

THOMAS GLOVER'S Workshops are now the most extensive in this or any other country, and he is thereby enabled promptly to execute orders to any extent required. Purchasers may at any time inspect his Works and the Materials of which his Meters are constructed. He is ready to enter into Contracts with Gas Companies and others to uphold their Stock of his Meters for Twenty Years at an annual charge varying from 2½ to 5 per cent., and to leave always in the hands of Gas Companies Three Years' charge for upholding, as a guarantee for the fulfilment of the Contract.

THOMAS GLOVER,**PATENT DRY GAS-METER MANUFACTURER,**

SUFFOLK STREET, CLERKENWELL GREEN, AND

ALLEN STREET, GOSWELL STREET, E.C. (293)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

FUEL AND STEAM ECONOMY.—

Apply to **Mr. LEE STEVENS, C.E.**, 1 Fish-street-hill, E.C. 243

CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cellars, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Remittance (244)

RUSTON, PROCTOR, AND CO.,

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

(193)

TRACTION ENGINES,

(BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,

ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and
 South America, may now be seen, com-
 plete and in course of construction at the
 above works. BOYDELL'S TRACTION
 ENGINES AND ENDLESS RAILWAY will
 draw heavier loads over good roads than
 any other traction engine, and on soft
 and bad roads will draw heavy loads
 where no other traction engine can move
 itself. All objection to the wear and
 tear of these Engines is entirely re-
 moved by the use of Charles Burrell's
 improved patent Wrought Iron Wheels,
 fitted with Rails and Tyre, as well as all
 the wearing parts, of Steel.

HOPE IRON WORKS.
SOUTHWARK BRIDGE ROAD.
LONDON.

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and
 Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

TO BRASS-FOUNDERS, ENGINEERS, &c.

**THE PATENT PLUM-
 BAGO CRUCIBLE COMPANY**
 having completed the enlargement
 of their premises, beg to call the
 attention of all users and shippers
 of Melting Pots to the great su-
 periority of the PATENT CRUCI-
 BLES, which have been used dur-
 ing the last three years by some
 of the largest melters in England
 and abroad. In addition to their
 capabilities of melting an average
 of from thirty-five to forty pour-
 ings, they are unaffected by change
 of temperature, never crack, but
 can be used till worn out, requiring only one anneal-
 ing for several days' work, and become heated much
 more rapidly than ordinary pots, effecting thereby
 a saving of more than fifty per cent. in time, labour, fuel,
 and waste. The Patent Plumbago Crucible Company also
 manufacture and import clay crucibles, muffles, portable
 furnaces, sublimate pans and covers, glass-pots, all descrip-
 tions of fire-standing goods, and every requisite for the
 assayer and dentist. For Lists, Testimonials, &c., apply
 to Battersea Works, London, S.W.

LUND'S LONDON LEVER

NOTICE TO MACHINE-MAKERS, BRICK AND TILE MAKERS.

INFRINGEMENTS ON PATENTS.

I HEREBY GIVE NOTICE, that the Prize Brick-Making Machine lately Exhibited at Warwick by Mr. John Whitehead, of Preston, Lancashire, and since Advertised by him, is a Direct Infringement upon the Patents granted to me, Henry Clayton (18th December, 1852, No. 1045, and 8th October, 1853, No. 2312), and that proceedings are being taken against him. In the meantime, Purchasers or Users of the Machine are cautioned that they will expose themselves to Proceedings for an Infringement of the said Patents.—Dated 29th September, 1859.

(349)

LITHOGRAPHY AND WOOD ENGRAVING.
G. T. IZOD, Draughtsmen and Engravers

on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated, Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. G. T. Izod and Co., Tudor-street, New Bridge-street, opposite the City Gas Works, London.
(365)

SELF-ACTING VALVE REGULATORS,
Registered No. 4064.

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 2s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRBANKS and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—
55A HOLYWELL-ST., MILLBANK, S.W.; LONDON.
(348)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week.
(77)

GENERAL PATENT COMPANY, LIMITED.—Established for the purpose of aiding Inventors and Patentees in patenting, completing, and developing their Inventions.

PATRONS.
William Fairbairn, Esq., C.E., F.R.S., F.G.S.
F. S. Powell, Esq., Horton Hall, Bradford.

The operations of this Company comprise every description of business connected with Patents and Inventions. Inventions patented and designs registered at most moderate charges. Inventions disposed of on Commission. A prospectus containing full particulars, together with a monthly list of the Patents, &c., now on the Company's books for sale, may be had on application to

ROBERT M. LATHAM,
Offices, 71 Fleet-street, E.C. Secretary.
Influential applications for Agencies from unrepresented districts will be entertained, and liberal terms accorded.
(366)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.
Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street.
(361)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.
HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E.
(362)

TO LOCOMOTIVE ENGINE BUILDERS, OR SUPERINTENDENTS.

A LOCOMOTIVE ENGINEER of Long Experience in the Manufacture of Railway Plant, is anxious to meet with an Engagement in any Capacity in which his services may be useful.
Address, Engineer, the Cottage, Cadogan Gardens, Sloane-street, Chelsea.
(367)

TO PATENT AGENTS, &c.

WANTED a Gentleman thoroughly conversant with, and able to Conduct, the Business of a Patent Agent in all its Branches and Departments, in the absence of the Principal. None but really competent persons need apply. Unexceptional references required.
Address, stating particulars and salary expected, to L. L., care of F. L. Lyne, Esq., 12 Pancras Lane, E.C.
(368)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE
POCKET STEREOSCOPIC PANORAMA,
FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S,
85 King William-street, City.
(346)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London.
(345)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITTLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gera, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts. (215)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description of

RAILWAY PLANT AND IRONWORK.
NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslayi, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.
Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (89)

FARRAR'S PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, Gwynne, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilize about 400° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 350° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, Gwynne & Co., Engineers, Essex-street Wharves, Strand, W.C., London. (251)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED
BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON and Co.,**
New Broad-street, E.C. (277)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to **PAGE and CAMERON, 64 Old Broad-street, London, E.C.** (284)

CRAWHALL AND CAMPBELL,

ENGINEERS' TOOLS FOR SALE.—A
Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 3 in. plates. Two Ditto for 3 in. plates, and Two Ditto for 1 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HAILEY'S and other LIFTING JACKS; RATCHET BRACES, &c.

Apply to **PAGE and CAMERON, 64 Old Broad-st., E.C., London.** (285)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LESTER, Gunmaker, 68 Margaret-street, Regent-street and by DAW, of Broad-street. (247)

TO INVENTORS.

INDIA-RUBBER APPARATUS OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE
BANDING is NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR; also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lord's Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (308)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving the cost of the Articles.

CLEGG ON COAL-GAS.
Now ready, price £1 11s. 6d., cloth, the Third Edition, greatly enlarged, and with numerous additional illustrations, of

A PRACTICAL TREATISE ON THE MANUFACTURE AND DISTRIBUTION OF COAL-GAS, its Introduction and Progressive Improvement. Illustrated by Engravings from Working Drawings, with General Estimates. By SAMUEL CLEGG, Jun., M. Inst. C.E. London: JOHN WEALE, 59 High Holborn. (358)

NEW PRACTICAL WORK BY PROFESSOR RANKINE.

One Volume, Crown 8vo., 12s. 6d., Cloth.
THE STEAM ENGINE, AND OTHER PRIME MOVERS. By WILLIAM JOHN RANKINE, LL.D., C.E., F.R.S., &c., Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. Illustrated with numerous Engravings from Original Drawings.

SYNOPSIS.
HISTORICAL ESSAY.—Origin and Progress of the Steam Engine.

INTRODUCTION.—Mechanical Principles applicable to all Prime Movers.—Work and Energy.—Power.—Efficiency.—Indicators and Dynamometers.—Brakes.—Fly Wheels.—Governors.—Principles of the Strength of Machines.

PART I.—Of Muscular Power.—Power of Man.—Power of Horses and other Beasts.

PART II.—Of Water Power and Wind Power.—Water Pressure Engines.—Water Wheels.—Turbines and Vortex Wheels.—Windmills.

PART III.—Of Steam and other Heat Engines.—Phenomena of Heat.—Combustion and Fuel.—Efficiency and Economy of Furnaces and Boilers.—Principles of Thermodynamics (or the Science of the Relations between Heat and Mechanical Energy).—Application of those Principles to the Action of Steam and other Fluids in Driving Engines.—Efficiency of those Engines when driven by Air.—by Saturated Steam.—by Superheated Steam.—by Steam and Ether.—Various Forms and Arrangements of Furnaces and Boilers.—Stationary, Marine, and Locomotive Mechanism of Steam Engines.—Cylinders and Pistons.—Valves.—Valve-gearing Pumps.—Various arrangements of Mechanism in Stationary, Marine, and Locomotive Engines, &c., &c.

PART IV.—General Principles of Electro-magnetic Engines.

APPENDIX.—TABLES of the Properties of Steam and other Substances, and of Numbers useful in Calculations respecting Steam Engines and other Prime Movers.

London: RICHARD GRIFFIN & Co., Stationers' Hall-court; and Glasgow. (356)

Just Published, Price 3d.
THE BUILDING STRIKE; or Men versus Masters. The Trial and Verdict, containing a fair statement of both sides of the question, with Good Advice to each in the present time of difficulty. London: WARD & LOCK, 158 Fleet-street. (333)

HOROLOGY, Theoretical and Practical; By JAMES FERGUSON COLE.

In Twelve Sections, comprising Principles of General Construction, Escapements, Compensation, and Isochronism, with numerous Illustrations of Improvements for Preventing the Detrimental Effects of External Motion on Watches.

To be published by Subscription, at 10s. 6d. per copy. Address to the Author, 29 Devonshire-street, Queen-square, London, W. C. (333)

"MECHANICS' MAGAZINE" & PATENT OFFICE,
166 FLEET STREET, LONDON, E.C. (11)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar channels throughout the entire length."—*Expositor*.

Poisoned Water Preventable BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter:

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

Every Variety of Gutta Percha Article.

SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (99)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster; 8 W., and 97 Capel-street, Dublin.
18th May, 1859. (264)

TO ENGINEERS & MANUFACTURERS.—INDIA-RUBBER WASHERS, Valves, Engine Packing, Fire-engine and Factory Hose-pipes, Gas Tubing, &c.

JAMES LYNE HANCOCK,

Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (258)

RANSOMES' PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c.—By this process the softest and most friable Stone, Cement, or Stucco, can be rendered impervious and imperishable, DECAY AT ONCE ARRESTED AND PREVENTED.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (175)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

To Engineers, Railway, Water, and Gas Companies, Iron Ship and Bridge Builders, Marine, Locomotive and Stationary Boiler Manufacturers &c., Brewers, Distillers, Sugar Refiners, &c.

WARNE'S

NEWLY PATENTED

FERRUGINOUS CEMENT PACKING,

IN SHEETS AND WASHERS,

Applicable to Steam, Water, Air, and Gas Joints of all descriptions, in place of Iron Cement, Sheet Lead, Red and White Lead, Gasket, Millboard, &c.

1. To Cylinder, Air and Vacuum Pump Covers and Doors, Condensers, hot and cold Liquor Pumps, Valve Covers, Steam feed and water flange and socket pipe joints, Man and Mud-Hole joints, to CAST IRON TANKS, and to repairs of Marine, Locomotive, and Stationary Boilers, &c.
2. To Railway purposes, to the bedding of Rails, Chairs, and fish joints, to the bedding and adjusting of Girders and Turn Tables—to the construction of IRON BRIDGES and of IRON SHIPS, and to bedding Marine Boilers on Bearers, &c., &c.
3. To Gas Mains and Pipes, Retort joints, to the construction of Gasometers and Gasholders, &c., &c.
4. To all joints of Steam, hot and cold Liquor Pipes and Pumps for Brewers, Distillers, Sugar Refiners, Chemical Manufacturers, Tanners, Dyers, and in fact all uses where the common Iron Cement, Lead, or other joint has been hitherto applied.

The important advantages of the PATENT FERRUGINOUS CEMENT PACKING consists in the Indestructibility of the material, either by Fire, Steam, Water, or Gas—in its instant and ready application—and in its great economy of time and labour in making joints, in place of the ordinary Iron Cement. For all permanent joints (elastic before its application) it can be made to set as hard as Iron, and it will expand and contract in the same ratio as the Metal; while, for all other joints, it can be made sufficiently elastic to answer all the purposes of India-rubber or other Packing.

Directions for Use.—Immediately before use, the Patent Ferruginous Packing, when intended for permanent joints, should be pickled for at least Six Hours in a solution of Sal Ammoniac—1 lb. to a pint of Water; when not intended for permanent joints, the pickling is not necessary.

Sole Manufacturers—

WILLIAM WARNE & CO.,

9 Gresham-street-west, E.C.—Mills, Tottenham, N. (340)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS,

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET,

LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND BILL-BARS

are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (195)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,

India-rubber Manufacturers, 9 Gresham-street West, E.C. MILLS—Tottenham, N. (360)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.

13 DOCK-STREET, DUNDEE. (280)

THE PATENT PLUMBAGO CRUCIBLE

COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY, Battersea Works, London, S. W. (334)

BALLOONS or Boats Driven by Steam.

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell.

These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

MACHINERY of all Kinds DRAWN and ENGRAVED on WOOD, with the greatest accuracy of detail and Artistic Effect, by

L. WALMSLEY,

2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS

and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on Every TUESDAY, at 10½ O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1855,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

THE IMPERIAL IRON TUBE COMPANY (Successors to GEORGE B. LLOYD and Co.),

Gas-street and Berkley-street, Birmingham,

Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (201)

SCOTT'S PATENT GRASS-SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN EYE-GRASS, &c., AND SCOTT'S PATENT CARROT SEED BEARDING

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square London, N.W.

CLAYTON, SHUTTLEWORTH, AND CO., OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of
implements forwarded post free upon application. (318)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

F.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to **R. G. & SONS**, at **LEISTON WORKS, SAXMUNDHAM, SUFFOLK.** 314

IMPROVED MACHINERY FOR AGRICULTURISTS.**RICHARD GARRETT & SONS,**

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of **FIRST CLASS Agricultural Machinery**, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.
STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
 &c. &c. &c.

Of which full detailed particulars will be found in **R. G. & SONS' ILLUSTRATED CATALOGUE**, sent free to any address, in English, French, or German; and any of the above Machines will be shown in operation at **R. G. & Sons' Farm**, near the Works, on their receiving a few days' notice.

A Copy of **R. G. & SONS' new COLONIAL LIST** will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose. Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to **Mr. E. WHITE**, 6 Essex-street, Strand. (369)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 44 in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. **James Parker**, Inventor, 6 Lifford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (353)

ESTABLISHED 1700.

WINDOW BLINDS—GEO. F. JANES and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with despatch. Experienced Workmen sent to any part of the kingdom. (355)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (356)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (375)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capuled. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 2s. 6d. (216)

TO MECHANICS.

WHO'S YOUR TAILOR?

Try MORDAUNT'S for GOOD and CHEAP CLOTHING,

13 CANNON-ST., LONDON BRIDGE. (345)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by **W. SPILLER**, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 5 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTOR and ENGINEERS.

2 John-Street, Minorities, London, E.C. Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (199)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Waggon Wheels.

STEEL-IRON for Springs. **MERCHANT** and other Irons manufactured. **WM. F. HOYLE**, Proprietor. (278)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), **ALEX. NEWLAND.**"

GRAY and Co.**, 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—Apply to **Mr. LEE STEVENS, C.E.**, 1 Fish-street-hill, E.C. 243

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorises but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Cheque. (288)

JOHN WARNER AND SONS,

8 CRESCENT, JEWIN STREET, LONDON.

HYDRAULIC ENGINEERS, BRASS AND BELL FOUNDERS,

PATENTEES OF IMPROVEMENTS IN PUMPS.

Patent Vibrating Standard Lift and
Force Pumps.

PATENT CAST-IRON PUMP fitted with J. Warner and Sons' Patent Bucket and Sucker, which cannot clog in action, for Farms, Cottages, and Wells, not exceeding 28 feet.

Size.	Height.	£ s.
2 1/2 in. short	1 ft. 7 in.	1 10
3 in. long	3 " "	1 14
3 1/2 " "	6 " "	2 8
4 " "	3 " "	3 3
4 1/2 " "	3 " "	3 3
5 in. short, with 15 feet of Lead	3 " "	3 3
Pipe attached, ready for fixing	2 14	
2 1/2 in. long. do. do.	2 18	

4 in. Liquid Manure Pumps, with legs, £3 3s.; 1 1/2 in. Gutta Serena Suction Pipe, 1s. 11d. per foot; 2 in. Flexible Rubber and Canvas Suction Pipe, on Wires, 3s. 3d. per foot. The Barrel is 27 1/2 inches long, and the legs are 5 feet high. Larger sizes of the above if required.

PATENT BRASS LIFT AND FORCE PUMP, on Plank, for House purposes, supply of Cisterns, &c.

2 1/2 inch	£ s.
3 " "	6 0
3 1/2 " "	7 5
4 " "	8 0

A lighter Pump of 3 inches diameter, can be supplied if required. 5 15

IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

These Pumps are fitted with J. Warner and Son's Patent Bucket and Sucker, and cannot clog in action. The Barrel is of Galvanized Iron, not likely to corrode, and can be raised or lowered at pleasure. The legs will fold together, and the whole may be carried on shoulder to any pond or tank required.

WARNER'S SWING WATER-BARROW.
(To hold Thirty Gallons), £3 3s.,

Is intended for all large Establishments where much watering is done by the watering-pot. By its use much time and labour of the Gardener are saved, particularly where the Tank, Pond, or Pump is at a distance from the garden.

MUSICAL SHEEP BELLS, with Straps, in sets of 6, 10s.; ditto, in sets of 8, 25s.; ditto, in sets of 12, 38s.

WARNER'S CATTLE AND SHEEP BELLS, in sets of 6, with Straps, 13s. per set.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c., cast for any size, note, or weight, singly or in peals. Tuned by machinery. Stocked and wheeled ready for fixing. Old Bells re-cast or taken in exchange.

The great 16-ton Bell, for the Houses of Parliament, was made by JOHN WARNER and SONS, 1856, under their Patent.

May be obtained of any Ironmonger or Plumber, in town and Country; or of the Patentees and Manufacturers, as above. (30)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 497

BESSEMER STEEL.—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 24th of June last. (303)

Important to every man who keeps

THORLEY'S FOOD FOR CATTLE,

77, NEWGATE STREET, LONDON

Price 50s. per Cask, containing 448 Feeds

Carriage paid to any Station.

A Pamphlet, Post-free, on application. (123)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S
LONDON RACK CORK
SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlers' and Ironmongers'. (254)

A COURSE OF SIX LECTURES ON A SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock.

Tickets will be issued at 5s. each for the course, or 1s. each Lecture, at South Kensington.

By order of the Committee of Council on Education.
(351)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College.
(320)

NOTICE TO MACHINE MAKERS, BRICK AND TILE MAKERS.

INFRINGEMENTS ON PATENTS.

I HEREBY GIVE NOTICE, that the Prize Brick-Making Machine lately Exhibited at Warwick by Mr. John Whitehead, of Preston, Lancashire, and since Advertised by him, is a Direct Infringement upon the Patents granted to me, Henry Clayton (13th December, 1852, No. 1045, and 8th October, 1853, No. 2812), and that proceedings are being taken against him. In the meantime, Purchasers or Users of the Machine are cautioned that they will expose themselves to Proceedings for an Infringement of the said Patents.—Dated 29th September, 1859.

HENRY CLAYTON,
Patentee and Engineer, Atlas Works, Upper Park-place, Dorset-square, London.

Solicitors, Messrs. WILSON & BRISTOWS,
London.
(357)

GALVANIZED and CORRUGATED IRON and every description of Galvanized Iron Goods.
W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.
All kinds of Iron-work Galvanized.
(375)

TO WIRE ROPE MAKERS.—ARCHIBALD SMITH is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 69 Princes-street, Leicester-square, W.
(198)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."
(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.
Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."
Jonathan Ayleen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.
William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.
Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS
Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.
John Abbott and Co., Park Works, Gateshead, Durham.

J. and E. Lumsden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Milbank Forge, Hartlepool.

Henry Wood and Co., Goree Piazzas, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wight and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcus, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire.

DEPOTS.

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London,

and at 4 Goree Piazzas, Liverpool.

JOHN TROTMAN,

PATENTEE, 43 CORNHILL, LONDON.
(349)

LITHOGRAPHY AND WOOD ENGRAVING.

G. T. IZOD, Draughtsmen and Engravers on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated, Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. G. T. Izod and Co., Tudor-street, New Bridge-street, opposite the City Gas Works, London.
(365)

SELF-ACTING VALVE REGULATORS,

Registered No. 4064.

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the Kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRB & CO., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators. Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—

55A HOLYWELL-ST., MILLBANK, S.W., LONDON.
(348)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week.
(77)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SWIRN, Patentee, 68 Princes-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application.
(148)

FOR DRIVING MACHINERY, MILLS,

&c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

JAMES LYNE HANCOCK,

Vulcanised India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C.
(280)

TO PARENTS AND GUARDIANS.—

MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B. MECHANICS' MAGAZINE Office, 166 Fleet-street, London.
(316)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E.
(362)

TO LOCOMOTIVE ENGINE BUILDERS, OR SUPERINTENDENTS.

A LOCOMOTIVE ENGINEER of Long Experience in the Manufacture of Railway Plant, is anxious to meet with an Engagement in any Capacity in which his services may be useful.

Address, Engineer, the Cottage, Cadogan Gardens, Sloane-street, Chelsea.
(367)

TO PATENT AGENTS, &c.

WANTED a Gentleman thoroughly conversant with, and able to Conduct, the Business of a Patent Agent in all its Branches and Departments, in the absence of the Principal. None but really competent persons need apply. Unexceptional references required.

Address, stating particulars and salary expected, to L. L., care of F. L. Lyne, Esq., 12 Pancras Lane, E.C.
(368)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE

POCKET STEREOSCOPIC PANORAMA,

FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S,
85 King William-street, City.
(345)

WANTED.—A Second-hand PAPER-MAKING MACHINE, or any Parts of Paper-Making Machinery.—Apply by letter, stating Price and Particulars, to O. R., care of Wm. Dawson & Sons, Advertising Agents, 74 Cannon-street, City, E.C.
(374)

INVENTORS ASSISTED.—Apply to Messrs. B. BROWN and CO., British and Foreign Patent Office, 52 King William-street, London-bridge, London.—Provisional Protection from £6 6s. to £8 8s.—A Pamphlet Gratis.
(378)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at

CHESTER:—

FIRST PRIZE OF £50 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For Repatriation.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts. (315)

THE RAILWAY CARRIAGE COMPANY,

OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.
Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (39)

FARRAR'S

PATENT FOR MAKING STEEL,

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (312)

GREAT REDUCTION IN THE COST OF STEAM POWER.

THE temperature of the products of burnt fuel escaping into the Smoke-boxes of Locomotive and Portable Engines is upwards of 800°. DUNCAN, GWYNNE, and C. WYE WILLIAM'S PATENT HEAT DIFFUSERS, placed in the Tubes, will utilise about 40° of the heat, convert it into an equivalent of working steam, and reduce the temperature to about 460° or 400°.

The Patentees are prepared to accept for Royalty a part of the value of the fuel saved by the use of their simple appliances.

Every information may be had on application to the Manufacturers, GWYNNE & CO., Engineers, Rensselaer Wharves, Strand, W.C., London. (351)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON and CO.,**
New Broad-street, E.C. (37)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 30in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 30in. stroke.
Two of 20-horse power, 20in. cylinder, and 30in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to **PAGE and CAMERON**, 64 Old Broad-street, London, E.C. (281)

CRAWHALL AND CAMPBELL,

MACHINE AND TOOL MAKERS,

AND MILLWRIGHTS,

ENGINEERS' TOOLS FOR SALE.—A

Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 1 in. plates. Two Ditto for 2 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RACKET BRACES, &c.

Apply to **PAGE and CAMERON**, 64 Old Broad-st., E.C., London. (282)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LEECH, Gunmaker, 68 Margaret-street, Regent-street and by DAW, of Broad-street.

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (392)

VULCANISED INDIA-RUBBER MACHINE

BANDING is NOT AFFECTED BY WET, HEAT, OR OIL; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, odour, or colour: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late Dopes, Bacon, and Co.)
44 St. Paul's Churchyard, London, E.C. (306)

SCOTT'S PATENT GRASS SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,
AND
SCOTT'S PATENT CARROT SEED BEARDING

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Euston Square London, N.W.

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

FOWLER'S PATENT STEAM PLOUGH.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching Plough, and Scarifier.

For further particulars, Illustrated Catalogues, and Prices, apply to

Synopsis.

HISTORICAL ESSAY.—Origin and Progress of the Steam Engine.

INTRODUCTION.—Mechanical Principles applicable to all Prime Movers—Work and Energy—Power—Efficiency—Indicators and Dynamometers—Brakes—Fly Wheels—Governors—Principles of the Strength of Machines.

PART I.—Of Muscular Power—Power of Men—Power of Horses and other Beasts.

PART II.—Of Water Power and Wind Power—Water Pressure Engines—Water Wheels—Turbines and Vortex Wheels—Windmills.

PART III.—Of Steam and other Heat Engines—Phenomena of Heat—Combustion and Fuel—Efficiency and Economy of Furnaces and Boilers—Principles of Thermodynamics (or the Science of the Relations between Heat and Mechanical Energy)—Application of those Principles to the Action of Steam and other Fluids in Driving Engines—Efficiency of those Engines when driven by Air—by Saturated Steam—by Superheated Steam—by Steam and Ether—Various Forms and Arrangements of Furnaces and Boilers—Stationary, Marine, and Locomotive Mechanism of Steam Engines—Cylinders and Pistons—Valves—Valve-gearing—Pumps—Various arrangements of Mechanism in Stationary, Marine, and Locomotive Engines, &c., &c.

PART IV.—General Principles of Electro-magnetic Engines.

APPENDIX.—Table of the Properties of Steam and other Substances, and of Numbers useful in Calculations respecting Steam Engines and other Prime Movers.

London: RICHARD GRIFFIN & Co., Stationers'-hall-court; and Glasgow. (359)

Just Published, Price 3d.

THE BUILDING STRIKE; or Men versus Masters. The Trial and Verdict, containing a fair statement of both sides of the question, with Good Advice to each in the present time of difficulty.

London: WARD & LOCK, 158 Fleet-street. (362)

HOROLOGY, Theoretical and Practical;

By JAMES FERGUSON COLE.
In Twelve Sections, comprising Principles of General Construction, Escapements, Compensation, and Isochronism, with numerous Illustrations of Improvements for Preventing the Detrimental Effects of External Motion on Watches.

To be published by Subscription, at 10s. 6d. per copy. Address to the Author, 29 Devonshire-street, Queen-square, London, W. C. (333)

TO ENGINEERS, MILLWRIGHTS, &c.
Lately published, with new Illustrations, 12th Edition, corrected and improved, to which is added a new Table of Fractional Numbers. 12mo, 5s., cloth.

THE MILLWRIGHT AND ENGINEER'S POCKET COMPANION: containing Decimal Arithmetic, Tables of Square and Cube Roots, Practical Geometry and Mensuration, Pumps, Pumping, and Steam Engines, with Tables of Circumferences, Squares, Cubes, &c. By WILLIAM TEMPLETON. Revised by S. MAYNARD.

"A more useful addition to the Engineer's library cannot well be conceived."—*Mechanics' Magazine*.

"The present edition having undergone the careful revision of so competent an editor as Mr. Maynard, is worthy of special recommendation."—*Athenaeum*.

"Will be found of great use to those for whom it is designed."—*Builder*.

Also, by the same Author,
TEMPLETON'S ENGINEER'S COMMONPLACE BOOK: consisting of Practical Rules and Tables adapted to Factory and Steam-Engines, &c. 4th Edition, with several new Illustrations. 12mo. 5s. cloth.

TEMPLETON'S LOCOMOTIVE ENGINE POPULARLY EXPLAINED. Illustrated by new Designs. 2nd Edit. 12mo. 4s. cloth.

London: SIMPKIN, MARSHALL, and Co., Stationers'-Hall-court. (335)

This Day is Published Price 9s.

A TREATISE ON HYDROSTATICS AND HYDRODYNAMICS. By W. H. BESANT, M.A., Fellow and Assistant Tutor of St. John's College, Cambridge.

Cambridge: DIGHTON, BELL, and Co. London: BELL and DALBY. (310)

Now published, 8vo. cloth, Price 7s. 6d.

THE SHRAPNEL SHELL in ENGLAND and in BELGIUM, with some reflections on the use of this Projectile in the late Crimean War. An Historical-Technical Sketch, by Major-General BORMANN, Aide-de-Camp to his Majesty the King of the Belgians.
London: TRUBNER and CO., 60 Paternoster-row. (300)

Complete in Two Super-royal 8vo. Vols., price £3 5s., cloth gilt.

TOMLINSON'S CYCLOPEDIA OF USEFUL ARTS, Mechanics, Mining, and Civil Engineering. This work comprises upwards of 3,000 large Octavo Pages, and is illustrated by Forty Engravings on Steel and 2,477 Woodcuts.

JAMES S. VINTUR, City-road and Ivy-lane, London. (371)

This day is published,
HANDBOOK OF GEOLOGICAL TERMS AND GEOLOGY.

By DAVID PAGE, F.G.S.
In Crown 8vo, price 6s.

By the same Author,

I.
Third Edition, price 1s. 6d.,
INTRODUCTORY TEXT-BOOK OF GEOLOGY.
With Engravings on Wood, and Glossarial Index.

II.
Second Edition, revised and enlarged, price 6s.
ADVANCED TEXT-BOOK OF GEOLOGY,
DESCRIPTIVE AND INDUSTRIAL.
With Engravings, and Glossary of Scientific Terms.

WILLIAM BLACKWOOD & SONS, Edinburgh and London. (372)

TREDGOLD ON THE STEAM ENGINE; its Progressive and Present State of Improvement; embracing examples of Locomotive Engines for Railways, practically drawn and explained; Marine Engines for Sea, River, and Canal service; Stationary Engines employed in Manufacturing purposes; Engines employed in Mines for raising water, or supplying towns; the Cornish Pumping-engine, and its several effective duties; Engines for Mill-work, Flour-mills, &c.; High-pressure and Non-condensing Engines, foreign and English. With 226 Engravings, and 164 Woodcuts and Diagrams. Complete in Three Volumes, Royal Quarto, Price £4 14s. 6d., cloth.

London: JAMES S. VINTUR, City-road and Ivy-lane. (373)

ENTIRELY NEW EDITION OF DR. URE'S DICTIONARY.

On Monday, the 31st instant, will be published, PART I. in 8vo., price 5s., to be continued Monthly, and completed in 14 Parts, price 5s. each, forming 3 Volumes.

DR. URE'S DICTIONARY OF ARTS, MANUFACTURES, AND MINES. A New Edition, chiefly re-written, and greatly enlarged; illustrated with nearly Two Thousand Engravings on Wood. Edited by ROBERT HUNT, F.R.S., F.S.S., Keeper of Mining Records, &c. Assisted by

Dr. E. FRANKLAND, Ph.D., F.R.S. and C.S., Professor of Chemistry, St. Bartholomew's Hospital.

Dr. EDWARD SCHUNK, Ph.D., F.R.S., F.C.S., &c.

Dr. R. ANGUS SMITH, F.R.S., Author of the "Life of John Dalton," &c.

C. GREVILLE WILLIAMS, Esq., Author of "A Handbook of Chemical Manipulation."

T. H. HENRY, Esq., F.R.S., F.C.S.

Professor A. C. RAMSAY, F.R.S. and G.S., Local Director of the Geological Survey.

Dr. HENRY M. NOAD, Ph.D., F.R.S., Lecturer on Chemistry at St. George's Hospital.

WARRINGTON W. SMYTH, Esq., M.A., F.R.S., and G.S., Inspector of Crown Mines, &c.

And many others eminent in Science, and connected with the Arts and Manufactures.

London: LONGMAN, GREEN, LONGMAN, and ROBERTS. (364)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Figs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

IMPORTANT TO MANUFACTURERS MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathes, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, greases, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least thirty pounds a year."

From JAMES ABERNETHY & Co., Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patents,

Personal attendance in London not necessary.Designs for Articles of Utility and of
Ornament Registered under the
Designs' Act.

ROBERTSON, BROOMAN, & Co.,

"MECHANICS' MAGAZINE" & PATENT OFFICE,
166 FLEET STREET, LONDON, E.C. (16)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price List of the above articles sent post free, by JAMES ASKINS, 20 Westminster Bridge Road, Lambeth, near Astley's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

FOR CORRECT FAMILY ARMS.

CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y paris Francals, Italian, Allemand, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 1d. Write to J. LOCK, City Heraldic Office, No. 2, Old Jewry, E.C. Envelope stamps, and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheapside.—No charge for the Die. (322)

TO RAILWAY COMPANIES, CONTRACTORS,
AND OTHERS.

GEORGE NEIGHBOUR and SONS,
OIL MERCHANTS,
Particularly invite attention to their PATENT ARGAND
LAMP OIL, for Railway Roof and Signal Lamps; also to
their EXTRA-REFINED ENGINE OIL, for Locomotive
and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon
Street. (28)

GLENFIELD PATENT STARCH,

USED IN THE ROYAL LAUNDRY,

AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS
TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

as inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c., &c. (78)

J. W. CLARE, C.E., Inventor of the Patent

Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Brake, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

TO ENGINEERS, ARCHITECTS, PATENT
AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS
and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.
SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (30)

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin.
18th May, 1859. (364)

BIRMINGHAM WAGGON COMPANY

(LIMITED) has RAILWAY WAGGONS for HIRE.
Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

RANSOME'S PATENT STONE FILTERS.
of every description for Domestic purposes, for Manufactures, Public Companies, Shipping, &c.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

TO RAILWAY COMPANIES, ENGINEERS, MILL-
OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE

COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S.W. (334)

BALLOONS or Boats Driven by Steam.—

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lilford-road, Camberwell.

These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-30th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

**MACHINERY of all Kinds DRAWN and
ENGRAVED on WOOD, with the greatest accuracy**
of detail and Artistic Effect, by

L. WALMSLEY,
2 Walbrook-buildings, City, E.C.Artists sent to all parts of the United Kingdom, if
required. (243)

EDWIN JEWITT, ENGRAVER ON WOOD

AND DRAFTSMAN, 1 Pickett-place, Strand, near
Temple-bar. Engineering, Scientific, and Mechanical
Designs accurately engraved. Manufacturers and Trades-
men's Catalogues Illustrated. W.C. (84)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM
ENGINES, IN WOOD OR METAL,

104 ST. JAMES'S PLACE, HAMPSHIRE ROAD.

Mr. BLOOMFIELD, having had many years' experience
in making models for the late firm of Watkins and Hill,
of Charing-cross, can confidently guarantee accuracy of
workmanship at very reasonable charges. (329)

INDIA-RUBBER VALVES FOR STEAM

ENGINES, PUMP PACKING, &c.—Explanatory
Drawings and Information as to the best modes of fitting
and arranging the above, and all other Mechanical Appli-
cations of VULCANISED INDIA-RUBBER, are furnished
post-free by

CHARLES MACINTOSH & Co., Patentees,

Cambridge-st., Manchester, and 3 Cannon-st. West, London.
MANUFACTORY AND DEPOT, Cambridge-st., Manchester.
GENERAL WAREHOUSE, 3 Cannon-street West, London,
E.C.—C. M. and Co.'s only Establishments. (139)

ISCA FOUNDRY COMPANY, OLD

BARRACKS, NEWPORT, MON.
ENGINEERS, AND RAILWAY WAGON BUILDERS.
Manufacturers of Switches, Points, and Crossings,
Chairs, Spikes, Bolts, and General Railway Fittings. (279)

TO MANUFACTURERS, THE ENGINEERING,
MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS

and BUILDERS' SALESMEN, having opened
Registers for Public and Private Sales of all kinds of JOB
LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c.,
(either Old or New,) beg to call the attention of all parties
to the only medium established of the kind, and to state
that they are prepared to receive consignments of any
weight, bulk, or value, and of any class of Goods for
immediate Sale. Full particulars may be had for two
stamp, at the BUILDING TRADES REGISTRY OFFICES,
(established 1857,) 13 EASTCHEAP, LONDON, E.C. The
Public Sales by Auction are held Weekly, on EVERY
THURSDAY, at ONE O'CLOCK, and for the present at the
BUILDERS' SALE GROUNDS, (established 1858,) 23 and
24 MARYLEBONE ROAD, REGENT'S PARK, W.
Catalogues by Post for One Stamp. Advances on New
Goods. All communications are held private and con-
fidential. (204)

THE IMPERIAL IRON TUBE COM-

PANY (Successors to GEORGE B. LLOYD and Co.),

Gas-street and Berkley-street, Birmingham,

Manufacturers of Wrought Iron Tubes and Fittings, for
Gas, Steam, and Water. Patent Glass-Enamelled and
Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (170)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.

LONDON.

(15)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their
NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING,
THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel are as stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

V.D.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK. 314

PATENT WEDGE AND GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their Works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Incline-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow 146)

BY HER MAJESTY'S ROYAL LETTERS PATENT.
PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM,
Engineers and Iron Founders, North Hants Iron Works
Basingstoke. (191)

YORKSHIRE TYRE & AXLE WORKS, ROTTERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4 in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lilford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (333)

GENERAL PATENT COMPANY, LIMITED.—Established for the purpose of aiding Inventors and Patentees in patenting, completing, and developing their Inventions.

PATRONS.
William Fairbairn, Esq., C.E., F.R.S., F.G.S.
F. S. Powell, Esq., Horton Hall, Bradford.

The operations of this Company comprise every description of business connected with Patents and Inventions. Inventions patented and designs registered at most moderate charges. Inventions disposed of on Commission. A prospectus containing full particulars, together with a monthly list of the Patents, &c., now on the Company's books for sale, may be had on application to

ROBERT M. LATHAM,
Offices, 71 Fleet-street, E.C. Secretary.
Influential applications for Agencies from unrepresented districts will be entertained, and liberal terms accorded. (368)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE OFFICE, 186 Fleet-street. (361)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.
MILLS—Tottenham, N. (360)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JANES and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with despatch. Experienced Workmen sent to any part of the kingdom. (355)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (356)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Back. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Highbury Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (373)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and sealed. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 2s. 6d. (316)

TO MECHANICS.
WHO'S YOUR TAILOR?

Try MORDAUNTS for GOOD and CHEAP
CLOTHING,

13 CANNON-ST., LONDON BRIDGE. (342)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SKELETT, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 8 to 14 inches in the bore, and from 6 to 150 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.
Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTOR and ENGINEERS.

2 John-Street, Minories, London, E.C.
Are prepared to ESTIMATE FOR and CONSTRUCT BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or Stone. Also to supply Cranes, Girders, Turntables, and Railway Work and Plant generally. (199)

TO SHIPBUILDERS.
IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALAN NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY,
(Limited)
18 Wellington-street North, Strand, London, W.C. (370)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 25 Bath Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (213)

CONDY'S PATENT FLUID or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.
Free to Railway on receipt of Order or Stamp. (1928)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.
13 DOCK-STREET, DUNDEE. (1088)

RUSTON, PROCTOR, AND CO.,
LINCOLN; AND KENNET WHARF, 67 UPPER THAMES STREET, LONDON;
AGRICULTURAL ENGINEERS AND MILLWRIGHTS.

MANUFACTURES

PRIZE PORTABLE and FIXED STEAM ENGINES,
 SMITH'S PATENT STEAM PLOUGHS,
 PATENT PRIZE COMBINED THRASHING MACHINES,
 containing R. P. and Co.'s New PATENT CORN
 CLEANER,
 SAWING MACHINERY, CIRCULAR and VERTICAL of all
 Sizes,
 MILLS of all Kinds, FIXED and PORTABLE, for Grind-
 ing Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(34)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

GAS STREET AND BERKLEY STREET,
BIRMINGHAM.

Manufacturers of Wrought Iron Tubes & Fittings,
FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

(103)

THE LONDON
WARMING AND VENTILATING COMPANY,
 (LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by
 means of a modification of the plan successfully used during the last five years by
 Mr. Goldworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are
 equally available for the process.

The cost is less and the effect greater than that of any other known
 means.

The Horticulturist will find herein
 an instrument of new and important
 powers.

The apparatus may be seen in
 ST. PAUL'S CATHEDRAL, the
 various offices of the "Department
 of Science and Art," and in many
 churches and other buildings.

Particulars and Testimonials for-
 forwarded on application.

(12)

W. BLACKETT.
HOPE IRON WORKS.
SOUTHWARK BRIDGE ROAD.
LONDON.

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and
 Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

TO BRASS-FOUNDERS, ENGINEERS, &c.

**THE PATENT PLUM-
 BAGO CRUCIBLE COMPANY**
 having completed the enlargement
 of their premises, beg to call the
 attention of all users and shippers
 of Melting Pots to the great supe-
 riority of the PATENT CRUCI-
 BLES, which have been used dur-
 ing the last three years by some
 of the largest melters in England
 and abroad. In addition to their
 capabilities of melting an average
 of from thirty-five to forty pour-
 ings, they are unassisted by change
 of temperature, never crack, but
 can be used till worn out, requiring only one anneal-
 ing for several days' work, and become heated much
 more rapidly than ordinary pots, effecting thereby
 a saving of more than fifty per cent. in time, labour, fuel,
 and waste. The Patent Plumbago Crucible Company also
 manufacture and import clay crucibles, muffles, portable
 furnaces, sublimate pans and covers, glass-pots, all descrip-
 tions of fire-standing goods, and every requisite for the
 assayer and dentist. For Lists, Testimonials, &c., apply
 to Battersea Works, London, S.W.

BESSEMER STEEL—The Tenth Part of
 Bessemer's Patent for the Manufacture of Malleable
 Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C.,
 the Proprietor, by letter post paid, Poste Restante, Brussels,
 Belgium. See the *Engineer* of the 24th of June last.

(363)

LUND'S LONDON LEVER

FOR Drawing

Corks is the most
 simple and effec-
 tive Instrument
 ever offered to the
 public for removing
 the Corks from Bot-
 tles without disturb-

ing the contents. The use of this Lever
 prevents the possibility of any injury to
 the hand by the accidental breaking of the
 neck of the Bottle.

Sold by all Cutlers and Ironmongers,
 and at the Patentee's Wholesale Ware-
 house, 23, 24, 25 Fleet Street, London.

A COURSE OF SIX LECTURES ON SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock.

Tickets will be issued at 5s. each for the course, or 1s. each Lecture, at South Kensington.

By order of the Committee of Council on Education. (351)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBITT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

NOTICE

TO MACHINE MAKERS, BRICK AND TILE MAKERS.

WITH reference to an Advertisement under this heading, signed by Henry Clayton, JOHN WHITEHEAD, of Preston, Lancashire, who obtained the first prize at the Royal Agricultural Exhibition at Warwick, 1859, begs to give notice that no legal proceedings have been commenced against him by Henry Clayton, that he is advised that Henry Clayton has no grounds whatever for the charge of infringement made, and that Mr. Whitehead is prepared to indemnify all purchasers and users of his Machines against any legal proceedings which Mr. Clayton may choose to adopt.

Preston, Lancashire, October 21st, 1859. (332)

ENGINEERS' MACHINES AND TOOLS.

PLANING MACHINES.—Single and Double Powered Drilling and Boring Machines; Bolt-screwing and Nut-shaping Machines; Single and Double-ended Machines to punch and shear plate-iron from $\frac{1}{4}$ inch to $\frac{1}{2}$ inch thick, to work by hand and steam-power, from 13 cwt. to 10 tons; Boiler-plate Bending Rollers from 6 ft. 6 ins. to 14 ft. long, weight from 3 to 25 tons, to work by hand or steam-power, with the top roller to draw out if required to roll boiler tubes, iron mast and funnel plates to a true cylinder. Engravings, Specifications, and Prices by Post, or on application at Kent Iron Works, Bridge-street, Greenwich, S.E. (385)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.

John Abbott and Co., Park Works, Gateshead, Durham.

J. and E. Lumaden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Milbank Forge, Hartlepool.

Henry Wood and Co., Goree Piazzas, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wight and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcus, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire.

DEPOTS,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazzas, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (249)

GENERAL PATENT COMPANY, LIMITED.

The operations of this Company comprise every description of business in connection with Patents and Inventions. Inventions patented and designs registered at most moderate charges. Inventions disposed of on Commission. A prospectus containing full particulars, together with a monthly list of the Patents, &c., now on the Company's books for sale, may be had on application to

ROBERT M. LATHAM,

Offices, 71 Fleet-street, E.C. Secretary.

Influential applications for Agencies from unrepresented districts will be entertained, and liberal terms accorded. (387)

PATENT PENDULOUS FIRE BARS.

Letters of License are granted to Messrs GILKES, WILSON and Co., of Middlesborough, for North Yorkshire and county of Durham, and to Messrs. GEWARD and MACINTOSH, Aberdeen, for the north of Scotland.

Applications for other districts to be made to THORNTONS and TAYLOR, 54 Old Broad-street, London, E.C., or to J. LEE STEVENS, Patentee, 1 Fish-street-hill, London, E.C. (384)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

WANTED.—A Small Working Model Locomotive Engine and Tender. Also Two or Three Carriages, and a circular set of Rails for above. Address, stating full particulars and lowest prices, to E. M., Mr. Peter Terry, Stationer, 6 Hatton Garden, London, E.C. (313)

WANTED.—A Second-hand PAPER-MAKING MACHINE, or any Parts of Paper-Making Machinery.—Apply by letter, stating Price and Particulars, to O. R., care of Wm. Dawson & Sons, Advertising Agents, 74 Cannon-street, City, E.C. (374)

TO PATENT AGENTS, &c.

WANTED a Gentleman thoroughly conversant with, and able to conduct, the business of a Patent Agent in all its Branches and Departments, in the absence of the Principal. None but really competent persons need apply. Unexceptional references required. Address, stating particulars and salary expected, to L. L., care of F. L. Lyne, Esq., 12 Pancras Lane, E.C. (368)

TO IRON AND BRASS FOUNDERS.

TO BE LET, an Iron Foundry, with a connection for (Patented) Plain Castings, and with or without a small Brass Foundry. To a practical moulder with a small capital this is a good opening. For further particulars address "Alpha," Deacon's News-room, Leadenhall-street, E.C. (366)

MACHINISTS, ENGINEERS, AND FOUNDERS.

TO BE SOLD OR LET, a FACTORY which will accommodate from three to four dozen workmen, and with or without boiler, engine, shafting, tools, &c. For particulars, address K. J. W., City News Rooms, Cheapside, E.C. (360)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarm when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

STOVES.—The only Stoves for which a Prize

Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

ESTABLISHED 1700.

WINDOW BLINDS.—GEO. F. JAMES, and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury Place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with dispatch. Experienced Workmen sent to any part of the kingdom. (381)

THE IMPERIAL IRON TUBE COMPANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham.

Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (347)

LITHOGRAPHY AND WOOD ENGRAVING.

G. T. IZOD, Draughtsmen and Engravers on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated, Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. G. T. Izod and Co., Tudor-street, New Bridge-street, opposite the City Gas Works, London. (369)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market;
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER Farmer, Hatfield, Herts. (215)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.
simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (60)

FARRAR'S
PATENT FOR MAKING STEEL,
In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (373)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address GEORGE RICHARDSON and CO.,
New Broad-street, E.C. (277)

HORIZONTAL HIGH-PRESSURE
STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (234)

CRAWHALL AND CAMPBELL,
MACHINE AND TOOL MAKERS,
AND MILLWRIGHTS,
ELLIOT WORKS, FINNISTON,
GLASGOW.

ENGINEERS' TOOLS FOR SALE—A Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 1 in. plates. Two Ditto for 1 in. plates, and Two Ditto for 1 in. plates. VERTICAL DRILLING MACHINE; MILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RACHET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C. London. (263)

NORTON'S GOSSAMER CARTRIDGES,
FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LAYTON, Gunmaker, 68 Margaret-street, Regent-street and by DAW, of Broad-street.

TO INVENTORS.

INDIA-RUBBER APPARATUS
OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE
BANDING IS NOT AFFECTED BY FET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late Dodds, Bacon, and Co., 44 St. Paul's Churchyard, London, E.C. (266)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving the cost of the Articles.

CLERGON ON COAL-GAS.
Now ready, price £1 11s. 6d., cloth, the Third Edition, greatly enlarged, and with numerous additional Illustrations, of
A PRACTICAL TREATISE ON THE MANUFACTURE AND DISTRIBUTION OF COAL-GAS, its Introduction and Progressive Improvement. Illustrated by Engravings from Working Drawings, with General Estimates. By SAMUEL CLERGON, Jun., M. Inst. C.E. London: JOHN WEALE, 59 High Holborn. (359)

NEW PRACTICAL WORK BY PROFESSOR RANKINE.
One Volume, Crown 8vo., 12s. 6d., cloth.
THE STEAM ENGINE, AND OTHER PRIME MOVERS. By WILLIAM JOHN RANKINE, LL.D., C.E., F.R.S., &c., Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. Illustrated with numerous Engravings from Original Drawings.

SYNOPSIS.
HISTORICAL ESSAY.—Origin and Progress of the Steam Engine.

INTRODUCTION.—Mechanical Principles applicable to all Prime Movers—Work and Energy—Power—Efficiency—Indicators and Dynamometers—Brakes—Fly Wheels—Governors—Principles of the Strength of Machines.

PART I.—Of Muscular Power—Power of Men—Power of Horses and other Beasts.

PART II.—Of Water Power and Wind Power—Water Pressure Engines—Water Wheels—Turbines and Vortex Wheel—Windmills.

PART III.—Of Steam and other Heat Engines—Phenomena of Heat—Combustion and Fuel—Efficiency and Economy of Furnaces and Boilers—Principles of Thermodynamics for the Science of the Relations between Heat and Mechanical Energy—Application of those Principles to the Action of Steam and other Fluids in Driving Engines—Efficiency of those Engines when driven by Air—by Saturated Steam—by Superheated Steam—by Steam and Water—Various Forms and Arrangements of Furnaces and Boilers—Stationary, Marine, and Locomotive Mechanism of Steam Engines—Cylinders and Pistons—Valves—Valve-gearing Pumps—Various arrangements of Mechanism in Stationary, Marine, and Locomotive Engines, &c., &c.

PART IV.—General Principles of Electro-magnetic Engines.
APPENDIX.—Table of the Properties of Steam and other Substances, and of Numbers useful in Calculations respecting Steam Engines and other Prime Movers.

London: RICHARD GRIFFIN & Co., Stationers'-hall-court; and Glasgow. (350)

Just Published, Price 3d.

TO LOCOMOTIVE ENGINE BUILDERS, OR SUPERINTENDENTS.

A LOCOMOTIVE ENGINEER of Long Experience in the Manufacture of Railway Plant, is anxious to meet with an Engagement in any Capacity in which his services may be useful.
Address, Engineer, the Cottage, Cadogan Gardens, Sloane-street, Chelsea. (367)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor*.

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hall.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Buckingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

Every Variety of Gutta Percha Article.

RANSOME'S PATENT IMPERISHABLE

SILICEOUS STONE.—Chimney-Pieces, Ballustrades, Capitals, Trusses, Terminals, Fountains, Vases, Monuments, &c., of great beauty, at the most reasonable prices.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (147)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLECOMPANY draw the attention of all Owners of Machinery to their **FINE POWDERED PURE FLOUR PLUMBAGO**, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W. (334)**BALLOONS or Boats Driven by Steam.**—

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 15 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lilford-road, Camberwell.

These Small Boats go twice the speed of any others with half the fuel: a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

MACHINERY of all Kinds DRAWN and

ENGRAVED on WOOD, with the greatest accuracy of detail and Artistic Effect, by

and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on FRIDAY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUND, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

TO WIRE ROPE MAKERS.—ARCHIBALD

SMITH is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 64 Essex-street, Leicester-square, W. (156)

SCOTT'S PATENT GRASS SEED SEPARATOR,

which entirely extracts the Seeds of "COUCH," "TWITCH," "SPEAR," or "HAIR" GRASS
and other impurities from

PERENNIAL AND ITALIAN RYE-GRASS, &c.,
AND
SCOTT'S PATENT CARROT SEED BEARDING
AND

CLOVER AND TREFOIL MILLING OR DRAWING MACHINE,
which effectually removes the beard from Carrot Seed, rendering it fit for sowing with facility by drill or otherwise, and by the separation of abortive or diseased grains vastly increases its vegetative per centage. By a slight modification it is applicable to the other purposes before mentioned.

These Machines were admittedly the most novel, and, at the same time, the most useful and important to the Farmer of any exhibited at the late SMITHFIELD CLUB SHOW.

They may be seen at work at the Establishment of the Manufacturer,

Mr. T. MIDDLETON, Engineer, Southwark.

Communications to be sent to the Patentee, J. SCOTT, 111 Drummond Street, Foston Square London, N.W.

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.	} From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.
SELF-PROPELLING AND TRACTION ENGINES.	
STONE GRINDING MILLS.	
MORTAR AND PUG MILLS.	
MILLWRIGHTS' WORK of all kinds.	
SAWING MACHINERY, from 4 to 20 Horse Power.	
BRICK AND TILE MACHINES.	

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

DRAUGHTS of COLD AIR
and DUST round Room, Office, or outside Doors and Windows EFFECTUALLY PREVENTED by GREENWOOD'S PATENT INDIA-RUBBER STOPS, the most simple and effectual method of making air-tight joints to joiners' or cabinet work, old or new. These Stops can be had any length or pattern. Self-acting Spring Stops, for the bottoms of doors.

The Trade supplied.

JOHN GREENWOOD, Patentee, 10 Arthur-street West, London-bridge. (354)

CHADBURN BROTHERS' PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS' Works, Sheffield. The Gauges may be had of all respectable Ironmongers in the country. (356)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR
Private Residences, Farm Buildings, Churches, Chapels, Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln. (346)

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

IN all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,

Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (347)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (348)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY AND COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Breakers, Post Mills, Pumps, Weighing Machines, Corn Blows, their Patent Self-Adjusting Scythe, Garden Engines, Hand and Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

RICHARD GARRETT AND SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel are stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

F.B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK. 314

YORKSHIRE TYRE & AXLE WORKS,
ROTHERHAM.
LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.
STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4½ in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lilford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (353)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.
Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE AND CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.

FUEL AND STEAM ECONOMY.—Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cellars, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.

and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (238)

(193)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but *one or two* horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

(348)

GRESHAM'S

RECORD

PATENT

BUOY.

The RECORD BUOY is intended to be kept in some place available for instant use, and to be thrown overboard from a sinking ship, or a Vessel on Fire, so as to intimate disaster, having a paper inserted therein, already filled up with the Ship's Name, Port of Registry, Official Number, &c., and a few last words hastily written, intimating the nature of the calamity, with any further information that can be given at such a time. It has capacity and buoyancy to contain besides these, the Log Book, and several pounds' weight of Papers or Valuables. It is lined with Cork between the Cylinder and outside case, so that, although waterlogged, it will not sink, but keep afloat for a long time, probably for years.

In order to DISTINGUISH IT FROM ANY OTHER FLOATING SUBSTANCE, so that the Captain of a passing Ship may recognize it as an intimation of disaster, and consider it a sacred and imperative duty to pick it up and convey the information it contains according to the directions found within, it HAS RAISED CONSPICUOUSLY UPON ITS SURFACE A SILVERED GLOBE, which, owing to the reflection of the light, will make it visible at a great distance, and when dancing on the wave it shines, in fact, like a star in the firmament, and being distinguishable from anything else, its character cannot be mistaken.

It is furnished with ample directions to the finder how to act, and has Envelopes already directed to the proper authorities, who, on receipt thereof (and they should be transmitted by the first available means), will, after verifying them to prevent imposition, immediately convey the information to the owners of the lost Ship, to Lloyd's, and all parties concerned; and if a foreign ship, to the consul of the nation to which she belongs.

In order to establish uniformity, and to prevent the uncertainty and confusion which a multiplicity of Buoys of various forms might occasion, when their utility becomes apparent, and to make ESPECIAL RECOGNITION OF THESE UNDOUBTED, MR. JOHN GRESHAM, J.P. and Alderman of Hull, has Patented his Invention, and has arranged with the old-established Firm of

**GEORGE AND JOSEPH OLIVER,

**TO MANUFACTURE AND SUPPLY THEM, AND TO WHOM ALL COMMUNICATIONS SHOULD
BE ADDRESSED.**

(302)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W.

43

BESSEMER STEEL—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the *Engineer* of the 24th of June last.

LECTURES TO WORKING MEN, GOVERNMENT SCHOOL OF MINES, JERMYN-STREET.

THE FIRST COURSE OF SIX LECTURES, on the "First Principles of Chemistry," by Dr. Hofmann, F.R.S., will be commenced on Monday evening, the 14th instant, at 8 o'clock.

Tickets may be obtained by Working Men only, on Monday, the 7th inst., from 10 to 4 o'clock, upon payment of a registration fee of 6d. Each Applicant is requested to bring his name, address, and occupation written on a piece of paper, for which the ticket will be exchanged.

TRENHAM REEKS, Registrar. (389)

A COURSE OF SIX LECTURES ON SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock.

Tickets will be issued at 5s. each for the course, or 1s. each Lecture, at South Kensington.

By order of the Committee of Council on Education. (351)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

Principal—J. C. NESBIT, F.G.S., F.C.S., &c.

Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.

Analyses and Assays of every description, are promptly and accurately executed in the Laboratories of the College. (320)

NOTICE

TO MACHINE MAKERS, BRICK AND TILE MAKERS.

WITH reference to an Advertisement under this heading, signed by Henry Clayton, JOHN WHITEHEAD, of Preston, Lancashire, who obtained the first prize at the Royal Agricultural Exhibition at Warwick, 1859, begs to give notice that no legal proceedings have been commenced against him by Henry Clayton, that he is advised that Henry Clayton has no grounds whatever for the charge of infringement made, and that Mr. Whitehead is prepared to indemnify all purchasers and users of his Machines against any legal proceedings which Mr. Clayton may choose to adopt.

Preston, Lancashire, October 21st, 1859. (382)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Hear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Aylen, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS

Also awarded this Invention the First Class Medal, 1855.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (249)

GENERAL PATENT COMPANY,

LIMITED.

The operations of this Company comprise every description of business in connection with Patents and Inventions. Inventions patented and designs registered at most moderate charges. Inventions disposed of on Commission. A prospectus containing full particulars, together with a monthly list of the Patents, &c., now on the Company's books for sale, may be had on application to

ROBERT M. LATHAM,

Offices, 71 Fleet-street, E.C. Secretary.

Influential applications for Agencies from unrepresented districts will be entertained, and liberal terms accorded. (387)

PATENT PENDULOUS FIRE BARS.

Letters of License are granted to Messrs GILKES, W. LLOYD and Co., of Middlesborough, for North Yorkshire and County of Durham, and to Messrs. GEVARD and MACINTOSH, Aberdeen, for the north of Scotland.

Applications for other districts to be made to TREGELLAS and TAYLOR, 51 Old Broad-street, London, E.C., or to J. LEE STEVENS, Patentee, 1 Fish-street-hill, London, E.C. (384)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

AS MANAGER.—Wanted, by a practical Engineer and Draftsman, an engagement to superintend the erection and management of works and machinery, in which he has had over 20 years' practice. Satisfactory references as to respectability, qualifications, &c., will be given. Address, "Engineer," care of Messrs. Spon, 16 Bucklersbury, E.C., London. (391)

WANTED.—A Small Working Model Locomotive Engine and Tender. Also Two or Three Carriages, and a circular set of Rails for above. Address, stating full particulars and lowest prices, to E. M., Mr. Peter Terry, Stationer, 6 Hatton Garden, London, E.C. (383)

WANTED.—A Second-hand PAPER-MAKING MACHINE, or any Parts of Paper-Making Machinery.—Apply by letter, stating Price and Particulars, to O. R., care of Wm. Dawson & Sons, Advertising Agents, 74 Cannon-street, City, E.C. (374)

TO PATENT AGENTS, &c.

WANTED A Gentleman thoroughly conversant with, and able to Conduct, the Business of a Patent Agent in all its Branches and Departments, in the absence of the Principal. None but really competent persons need apply. Unexceptional references required. Address, stating particulars and salary expected, to L. L., care of F. L. Lync, Esq., 12 Pancras Lane, E.C. (368)

TO IRON AND BRASS FOUNDERS.

TO BE LET, an Iron Foundry, with a connection for (Patented) Plain Castings, and with or without a small Brass Foundry. To a practical moulder with a small capital this is a good opening. For further particulars address "Alpha," Deacon's News-room, Leadenhall-street, E.C. (386)

MACHINISTS, ENGINEERS, AND FOUNDERS.

TO BE SOLD or LET, a FACTORY which will accommodate from three to four dozen workmen, and with or without boiler, engine, shafting, tools, &c. For particulars, address K. J. W., City News Rooms, Cheap-side, E.C. (380)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS

FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarm when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilton, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

ESTABLISHED 50 YEARS.—I. ASTON'S

BOX AND IVORY RULE MANUFACTORY, No. 25 Old Compton-street, Soho. Surveyors' and Architects' Drawing Scales, T-Squares, Angles, Curves, Parallel Rules, Marquois Scales, Horse Measures, Standards for measuring Soldiers, Measuring Tapes, and every description of English and Foreign Rules and Scales made to order. All sorts of Rules repaired. Wholesale and Retail. (390)

NEW SMALL STEAM-BOATS.

These boats are propelled by steam rockets, and they go at least twice the speed of any other working models with half the fuel. On this plan, as the rockets could be made by thousands in the different ironworks of this country, a fleet of 10,000 gun-boats might be available for the defence of this country at a few weeks' notice. Any kind of vessel would do capable of carrying the gun and rockets. A rocket as an auxiliary power for a sailing vessel would give good way in a calm. The small boats are pretty interesting toys, 4½ ins. for a tray, 3 to 13 ins. for ponds, 5s. 6d., carriage free. JAMES PARKER, Inventor, 6 Lilford-road, Camberwell. (392)

STEAM BOILERS.

The Patentee of an Improvement in Cornish Boilers wishes to meet with a Boiler-builder who would try some inexpensive experiments, in consideration of receiving one-third share of the Patent, which may prove of considerable value. Address, "Alpha," office of this Paper. (398)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
 FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
 PRIZE OF £10 FOR BEST STEAM ENGINE.
 FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
 And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
 PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
 IMPROVED CIRCULAR-SAW BENCHES,
 CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
 PATENT CORN-DRESSING MACHINES AND BLOWERS,
 CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
 For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER AND OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts. (315)

THE RAILWAY CARRIAGE COMPANY,

OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.

Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (30)

FARRAR'S

PATENT FOR MAKING STEEL

In Three Hours in the Crucible, without Cementation.

For Licences to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,

BATTERSEA WORKS, LONDON, &W (313)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Back. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (278)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address GEORGE RICHARDSON and CO.,

New Broad-street, E.C. (277)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
 One of 10-horse power, 10in. cylinder, and 24in. stroke.
 Two of 12-horse power, 12in. cylinder, and 24in. stroke.
 One of 14-horse power, 12in. cylinder, and 30in. stroke.
 Two of 14-horse power, 14in. cylinder, and 24in. stroke.
 One of 18-horse power, 14in. cylinder, and 36in. stroke.
 Two of 30-horse power, 20in. cylinder, and 30in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

CRAWHALL AND CAMPBELL,

MACHINE AND TOOL MAKERS,

AND MILLWRIGHTS,

ELLIOT WORKS, FINNIESTON,

GLASGOW.

Manufacturers of Engineers' Tools of every description, Screwing Apparatus of standard gauge, Boring Bars, &c. (308)

ENGINEERS' TOOLS FOR SALE.—A Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Dlathe, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 4 in. plates. Two Ditto for 4 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; PILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RACHET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (285)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LENTON, Gunmaker, 68 Margaret-street, Regent-street and by Daw, of Broad-street. 32*

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER, 441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE

BANDING is NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOMES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (306)

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

(23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

ON THE MOST REASONABLE TERMS.

Engravings, with Price Lists, forwarded on application, post-free.

(593)

RICHARD GARRETT AND SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING, THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market in a thoroughly efficient manner. The points in which these new Machines more particularly excel are stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

*B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK.

314

DRAUGHTS of COLD AIR and DUST round Room, Office, or outside Doors and Windows EFFECTUALLY PREVENTED BY GREENWOOD'S PATENT INDIA-RUBBER STOPS, the most simple and effectual method of making air-tight joints to joiners' or cabinet work, old or new. These Stops can be had any length or pattern. Self-acting Spring Stops, for the bottoms of doors.

The Trade supplied.

JOHN GREENWOOD, Patentee, 10 Arthur-street West, London-bridge. (354)

CHADBURN BROTHERS' PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield. The Gauges may be had of all respectable Ironmongers in the country. (286)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Stations, And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln. (346)

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

IN all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,

Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (349)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Bruisers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Hard-wood Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions. Note.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (316)

CLEGG ON COAL-GAS.
Now ready, price £1 11s. 6d., cloth, the Third Edition, greatly enlarged, and with numerous additional illustrations, of
A PRACTICAL TREATISE ON THE MANUFACTURE AND DISTRIBUTION OF COAL-GAS, its Introduction and Progressive Improvement. Illustrated by Engravings from Working Drawings, with General Estimates. By SAMUEL CLEGG, Jun., M. Inst. C.E. London: JOHN WEALE, 59 High Holborn. (358)

NEW PRACTICAL WORK BY PROFESSOR RANKINE.
One Volume, Crown 8vo., 12s. 6d., Cloth.
THE STEAM ENGINE, AND OTHER PRIME MOVERS. By WILLIAM JOHN MACQUORN RANKINE, LL.D., C.E., F.R.S., &c., Regius Professor of Civil Engineering and Mechanics in the University of Glasgow. Illustrated with numerous Engravings from Original Drawings.

SYNOPSIS.
HISTORICAL ESSAY.—Origin and Progress of the Steam Engine.
INTRODUCTION.—Mechanical Principles applicable to all Prime Movers—Work and Energy—Power—Efficiency—Indicators and Dynamometers—Brakes—Fly Wheels—Governors—Principles of the Strength of Machines.
PART I.—Of Muscular Power—Power of Man—Power of Horses and other Beasts.
PART II.—Of Water Power and Wind Power—Water Pressure Engines—Water Wheels—Turbines and Vortex Wheels—Windmills.
PART III.—Of Steam and other Heat Engines—Phenomena of Heat—Combustion and Fuel—Efficiency and Economy of Furnaces and Boilers—Principles of Thermodynamics (or the Science of the Relations between Heat and Mechanical Energy)—Application of those Principles to the Action of Steam and other Fluids in Driving Engines—Efficiency of those Engines when driven by Air—by Saturated Steam—by Superheated Steam—by Steam and Ether—Various Forms and Arrangements of Furnaces and Boilers—Stationary, Marine, and Locomotive Mechanism of Steam Engines—Cylinders and Pistons—Valves—Valve-gearing—Pumps—Various arrangements of Mechanism in Stationary, Marine, and Locomotive Engines, &c., &c.
PART IV.—General Principles of Electro-magnetic Engines.
APPENDIX.—Table of the Properties of Steam and other Substances, and of Numbers useful in Calculations respecting Steam Engines and other Prime Movers.

London: RICHARD GRIFFIN & Co., Stationers'-hall-court; and Glasgow. (359)

Just Published, Price 3d.

TREDGOLD ON THE STEAM ENGINE;
its Progressive and Present State of Improvement; embracing examples of Locomotive Engines for Railways, practically drawn and explained; Marine Engines for Sea, River, and Canal service; Stationary Engines employed in Manufacturing purposes; Engines employed in Mines for raising water, or supplying towns; the Cornish Pumping-engine, and its several effective duties; Engines for Mill-work, Flour-mills, &c.; High-pressure and Non-condensing Engines, foreign and English. With 226 Engravings, and 164 Woodcuts and Diagrams. Complete in Three Volumes, Royal Quarto, Price £1 14s. 6d., cloth.

London: JAMES S. VIRTUE, City-road and Ivy-lane. (373)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE
POCKET STEREOSCOPIC PANORAMA.
FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at
P. C. LAMBORN'S,
85 King William-street, City. (345)

TO PARENTS AND GUARDIANS.—MECHANICAL ENGINEERING.—There is a Vacancy in one of the largest Establishments in the North of England for Half-a-Dozen Young Gentlemen as Apprentices. They would have the opportunity of a thorough insight, theoretical and practical, into the construction of steam engines and general machinery, the manufacture of forged and roller iron of every description, smithed work, iron and brass founding, mechanical drawing, agricultural implements, carpentry, joinery, railway material of all sorts, &c.

Premium in each case £150. The right would be reserved of declining to treat with any one who might in any respect be deemed unsuitable.

Address, early, by letter only, H. B., MECHANICS' MAGAZINE Office, 166 Fleet-street, London. (316)

SELF-ACTING VALVE REGULATORS,
Registered No. 4064.

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRB and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—
55A HOLYWELL-ST., MILLBANK, S.W., LONDON. (348)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E. (362)

TO LOCOMOTIVE ENGINE BUILDERS, OR SUPERINTENDENTS.

A LOCOMOTIVE ENGINEER of Long Experience in the Manufacture of Railway Plant, is anxious to meet with an Engagement in any Capacity in which his services may be useful.
Address, Engineer, the Cottage, Cadogan Gardens, Sloane-street, Chelsea. (367)

IMPORTANT TO MANUFACTURERS MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalis, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS. IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least thirty pounds a year."

From JAMES ABERNETHY & Co., Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using *cross bands* that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed, for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonechurch, Isle of Wight.

POISONED WATER PREVENTABLE

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of *leaden pipes* for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patentees,

LAWRIE AND HAGGER, Metal Brokers

33 Lombard-street, E.C.

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.
Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S.W. (334)

MACHINERY of all Kinds DRAWN and ENGRAVED ON WOOD, with the greatest accuracy of detail and Artistic Effect, by

J. WALMSLEY,

2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

EDWIN JEWITT, ENGRAVER ON WOOD AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradersmen a Catalogues Illustrated. W.C. (344)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL,
10½ ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

ISCA FOUNDRY COMPANY, OLD BARRACKS, NEWPORT, MON.

ENGINEERS, AND RAILWAY WAGON BUILDERS. Manufacturers of Switches, Points, and Crossings, Chairs, Spikes, Bolts, and General Railway Fittings. (279)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New), beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857), 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858), 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

MATHEMATICAL DRAWING INSTRUMENTS, RULES, TAPES, CHAINS, LEVELS, THEODOLITES, BOX SEXTANTS, PRISMATIC and POCKET COMPASSES. Price Lists of the above articles sent post free, by JOHN ASCHBURY, 20 Westminster Bridge Road, Lambeth, near Aschbury's Theatre. Every article warranted, and the prices will be found considerably lower than ever before charged for articles of similar quality. Routledge's Engineers' Slide Rules, 4s. 6d. each; Hawthorn's ditto, 5s. 6d.; Carpenters' Rules from 1s. (148)

FOR CORRECT FAMILY ARMS, CREST, or PEDIGREE, send name and county, and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y park Franceis, Italian, Allemand, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheapside. No charge for the Die. (322)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS, Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application. 127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (28)

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY,

AND PROHOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH, SEE THAT YOU GET IT,

as inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c., &c. (73)

J. W. CLARE, C.E., Inventor of the Patent

Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the *cheapest* coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.

SPENCER, READ, & Co., 4 Agar-street, Strand. W.C. (90)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin.

18th May, 1859. (264)

BIRMINGHAM WAGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

RANSOME'S PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c.

By this process the softest and most friable Stone, Cement, or Stucco, can be rendered Impervious and Impassable, DECAY AT ONCE ARRESTED AND PREVENTED.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (147)

TO INVENTORS AND PATENTEES.

MESSRS.

ROBERTSON, BROOMAN, & Co.,

Civil Engineers

AND PATENT AGENTS,

(ESTABLISHED 1823.)

166 FLEET STREET, LONDON, E.C.

Undertake to obtain Patents for Inventions

Provisional Protection for Six Months (the preliminary step in securing a Patent), obtained for the United Kingdom at a cost of £10 10s. Personal attendance in London not necessary.

Designs for Articles of Utility and of Ornament Registered under the Designs' Act.

In the United Kingdom and Foreign Countries and the transaction generally of all Business relating to PATENTS.

PROVISIONAL PROTECTIONS APPLIED FOR.

Specifications Drawn and Revised.

Disclaimers and Memorandums of Alteration Prepared and Filed.

Oppositions Conducted.

Searches made for Patents, and Copies or Abstract supplied.

ILLUSTRATIVE AND WORKING DRAWINGS MADE FROM MODELS OR SKETCHES.

Advice on Cases Submitted, Opinions as to Infringements, &c., &c.

Messrs. Robertson, Brooman, and Co. undertake (upon Commission) Orders for all Engineering Constructions, Railways, Locomotive and other Steam Engines, &c., &c.

Messrs. Robertson, Brooman, and Co., Have Correspondents in France, Belgium, Holland, Austria, Prussia, Portugal, United States, and other Foreign Countries.

ROBERTSON, BROOMAN, & Co.,

"MECHANICS' MAGAZINE" & PATENT OFFICE,
166 FLEET STREET, LONDON, E.C. (16)

GOLD and TEETH.—Messrs. BROWNE

and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to Stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

GALVANIZED and CORRUGATED IRON and every description of Galvanized Iron Goods.

W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E. All kinds of Iron-work Galvanized. (375)

THE IMPERIAL IRON TUBE COM-

PANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham, Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanized Tubes, and Lap-welded Iron Boiler Tubes. (147)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S. E.

LONDON.

(19)

YORKSHIRE TYRE & AXLE WORKS,
ROTHERHAM.
LOCOMOTIVE TYRE-BARS of every description for
Engines, Carriages, and Railway Waggon Wheels.
STEEL-IRON for Springs. MERCHANT and other Irons
manufactured. WM. F. HOYLE, Proprietor. (278)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.
MOST VALUABLE ASSISTANCE will be
rendered to persons in the above position; or to
such as may be desirous of arranging privately with
Creditors. There are thousands of persons who have
struggled long against the force of misfortune, but few are
aware that by a recent Act all small traders owing debts
not exceeding £300, can be entirely raised from their diffi-
culties, in all cases without imprisonment; and, if neces-
sary, cash advanced for the above purpose.
Country Insolvent cases attended to immediately. No
charge for consultation. The strictest secrecy may be
relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-
street, Strand. (369)

STEAM BALLOONS.—Much more pro-
pelling power is obtained by Steam Rockets than by
the Marine Engine from same amount of fuel. At low
pressure little Rocket Boats go twice as quick as any others
with half the fuel. At great pressure the propelling
power is equal to one-third the whole weight of the
engine, and thus is solved the problem of aerial navigation
by steam balloons. Small boats complete, (pretty in-
teresting toys) 4½ in. for lake tray, 3s.; 13 in. for ponds,
5s. 6d.; both rail free. James Parker, Inventor, 6 Lifford
Road, Camberwell. Fuel, a few drops of spirits. Steam
up in half-a-minute, and lasts five. (353)

CHUBB'S LOCKS, FIREPROOF SAFES,
CABIN AND DEED BOXES.
Complete lists of sizes and prices may be had on application.
CHUBB AND SON,
57 St. Paul's Churchyard, LONDON;
23 Lord-street, Liverpool; 16 Market-place, Manchester
and Wolverhampton. (4)

THE
SILVERTOWN INDIA-RUBBER WORKS
OPPOSITE
H. M. DOCKYARD, WOOLWICH.
INDIA-RUBBER MANUFACTURES

RECENT IMPROVEMENTS.

Warehouses, 3 and 4 Bishopsgate Within, E.C. (145)
WATER GLASS, or SOLUBLE SILI-
CATES of SODA or POTASH, in large or small
quantities, and either Solid or in Solution, at
ROBERT RUMNEY'S, Ardwick Chemical Works,
Manchester. (335)

ENGINEERS' MACHINES AND TOOLS.
PLANING MACHINES.—Single and
Double Powered Drilling and Boring Machines;
Bolt-screwing and Nut-shaping Machines; Single and
Double-ended Machines to punch and shear plate-
iron from ½ inch to 1½ inch thick, to work by hand and
steam-power, from 13 cwt. to 10 tons; Boiler-plate Bend-
ing Rollers from 6 ft. 6 ins. to 14 ft. long, weight from 3 to
25 tons, to work by hand or steam-power, with the top
roller to draw out if required to roll boiler tubes, iron
mast and funnel plates to a true cylinder. Engravings,
Specifications, and Prices by Post, or on application at
Kent Iron Works, Bridge-street, Greenwich, S.E. (385)

STOVES.—The only Stoves for which a Prize
Medal was awarded at the Paris Exhibition in 1855
were WALKER'S PATENT SELF-FEEDING STOVES.
They are acknowledged, after Twelve Years' Experience,
to be the most Economical and Perfect Hot-Air Stoves
invented for warming Churches, Gentlemen's Halls, Shops,
&c. They will burn for Sixteen Hours with one supply of
fuel, requiring no attention. These and WALKER'S IM-
PROVED MASSEY'S SHIP LOGS are to be had of all
respectable Ironmongers, or at the Manufactory, 58 Ox-
ford-street, Birmingham; where Prospectuses and Testi-
monials may be obtained. (378)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JANES
and CO., Wholesale, Retail, and Export Window
Blind Manufacturers, 29 Finsbury Place, and 9, 10, and
11 Cross-street, Finsbury. Estimates given and executed
with dispatch. Experienced Workmen sent to any part of
the kingdom. (381)

CAUTION.
TO ARCHITECTS AND BUILDERS.—In
consequence of numerous complaints, the Patentee
begs to inform the above, that all genuine SMITH'S PA-
TENT DOOR SPRINGS, for Swing Doors, are stamped
with Name and Address, thus—SMITH, Patentee, 69 Prince-
street, Leicester-square, London; and that Springs thus
marked are warranted. SMITH'S PATENT WEATHER-
TIGHT CASEMENT FASTENING AND SILL-BARS are
admitted by all to be the most perfect invention for the
purpose. Diagrams and List of Prices on application. (143)

PARTNERSHIP.—The ADVERTISER is
desirous of entering as Junior Partner in an Engi-
neering and Ship-building concern. He has several highly
useful Inventions applicable to Steam and Shipbuilding,
which he would Patent in the name of the firm. He is
capable of Designing and making Finished and Working
Drawings of Ships, Steam Engines, &c., and would devote
his whole time and attention to the business.
Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-
street. (361)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND
OTHER BOILER MAKERS; IRON-SHIP AND
BRIDGE BUILDERS; GAS AND RAILWAY COM-
PANIES, &c.

WARNE'S NEW PATENT FERRU-
GINOUS CEMENT PACKING, applicable to
Steam, Air, Water, and Gas Joints of all descriptions,
Water Tanks and Repairs of Boilers; for Railway purposes,
to Chairs and Fish-tail Joints, Turn Tables and Bridge
Girders, and to the Construction of Iron Bridges generally,
and of Iron Ships.
Among the many important advantages of the PATENT
FERRUGINOUS CEMENT PACKING, are, Indestructi-
bility by either Fire, Steam, Water, or Gas; Instant and
Ready Application; and great Economy of Time and
Labour by its use for Joints, &c., in place of the ordinary
Iron Cement. For all Permanent Joints it can be made to
set as hard as Iron, and it will Expand and Contract in the
same ratio as the metal itself. For all other Joints it can
be made sufficiently elastic for the purposes to which
India-rubber or other Packing is applied.
WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.
MILLS—Tottenham, N. (360)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JANES
and CO., Wholesale, Retail, and Export Window
Blind Manufacturers, 29 Finsbury-place, and 9, 10, and
11 Cross-street, Finsbury. Estimates given and executed
with dispatch. Experienced Workmen sent to any part of
the kingdom. (355)

FULLER BROTHERS, WINDOW BLIND
MANUFACTURERS, 45 High-street, Borough (Four
Doors from L. B. Railway), London. The Trade supplied
on the lowest terms. Well-seasoned Blinds for Exporta-
tion. Orders punctually attended to. (356)

LITHOGRAPHY AND WOOD ENGRAVING.
G. T. IZOD, Draughtsmen and Engravers
on Wood, Architectural, Mechanical, Ornamental,
and General Engravers. Tradesmen's Catalogues De-
signed and Illustrated, Facsimiles and Plans of Improve-
ments, &c., &c., executed in the best manner, at the low-
est possible charge. Estimates forwarded on receipt of
particulars. G. T. Izod and Co., Tudor-street, New
Bridge-street, opposite the City Gas Works, London. (363)

FOR DRIVING MACHINERY, MILLS,
&c.—INDIA-RUBBER BANDS, improved make, to
resist moist and dry heat, of any length, width, and thick-
ness. Prices and instructions for use on application.
JAMES LYNE HANCOCK,
Vulcanised India-Rubber Works, Goswell-mews, and
8 Goswell-road, London, E.C. (256)

THORLEY'S FOOD FOR CATTLE.—Every
person having an interest in domestic or farm animals
should obtain a supply of this celebrated and economical
food, which will prove invaluable during the approaching
season. For keeping horses in good condition, it is un-
equalled. Pigs fatten with surprising rapidity upon it, and
their flesh increases in flavour and value. Cowkeepers
will find great advantage in the increased quantity and
improved quality of the milk during its use. All animals
are benefited by it. A pamphlet on this interesting sub-
ject, accompanied by Testimonials from the principal No-
bility, Gentry, and Agriculturists, forwarded on application.
In Casks containing 48 Feeds (Measures enclosed), Price
50s., carriage paid to any Railway Station in the United
Kingdom. Post Office Orders payable to JOSEPH THORLEY
77 Newgate Street, London.
N.B.—The public are cautioned against being imposed
upon by worthless imitations. (132)

CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT,
Not only Deodorizes but Disinfects perfectly, and
destroys FOR EVER the cause of infection.
Is not poisonous, as it may be used to purify water.
Evolves no noxious or unpleasant gas. Cannot be mis-
taken for any other fluid, thereby preventing death and
disease; and is therefore the best, safest, cheapest, and
most pleasant disinfectant ever introduced.
This fluid has been examined and reported upon by the
Board of Health, all the most eminent Men and Chemists
of the day, in all cases in the most satisfactory manner
possible.
The Public are recommended to use this Fluid, properly
diluted with water, frequently and habitually in larders,
sculleries, dairies, musty cakes, sick rooms, close places,
&c., as it has numerous advantages, and can be used with
certain immediate success and perfect safety.
Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s.
and in bulk, 10s. per Gallon.
Free to Railway on receipt of Order or Stamp. (238)

RICHARD BAIRD, GENERAL COM-
MISSION AGENT, and CONTRACTOR for all de-
scriptions of RAILWAY PLANT and STORES.
13 DOCK-STREET, DUNDEE. (280)

VINEGAR.—Patronised by Her Majesty's
Government.
CONDY'S PATENT PURE
CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure
purity and effect a saving of 50 per cent. See "Report of
Dr. Letheby, City Officer of Health, Dr. Hassall, of the
'Lancet' Commission, and others." Sold by the Trade, in
Bottles, labelled and capsealed. Wholesale—63 King Wil-
liam-street, London-bridge, E.C. Six Quart Samples sent
free to any Railway for 3s. 6d. (218)

TO MECHANICS.
WHO'S YOUR TAILOR?
Try MORDAUNT'S for GOOD and CHEAP
CLOTHING,
13 CANNON-ST., LONDON BRIDGE. (342)

ARTESIAN WELLS, BORING TOOLS,
PUMPS, &c. Engineers, Architects, Surveyors,
Builders or others requiring a good supply of Water may
have any quantity procured by W. SPILLER, 14 York-street
Blackfriars-road, London, where may be had any quan-
tity of Tools for Sinking or Boring, from 2 to 30 inches
diameter, and from 100 to 2,000 feet depth; also Men and
Tools to bore for Railroads, Minerals, &c., in any part of
the world. Boring Tools and suitable Pipes for exporta-
tion, with full instructions for their use.
Builders, Contractors, Brickmakers, Barge and Snip
Builders, and others, can be supplied with Wrought or
Cast Iron Pumps, Double or Single, for excavation of Deep
Wells, from 3 to 14 inches in the bore, and from 6 to 130
feet in length, to work by hand or Steam Power.
Hot-Water Apparatus for Conservatories, &c., on the
most economical and improved principles.
Also Manufactory for Captain John Grant's much im-
proved Cooking Apparatus. (44)

GLADSTONE & Co., CONTRACTOR
and ENGINEERS,
2 John-Street, Minorics, London, E.C.,
Are prepared to ESTIMATE FOR and CONSTRUCT
BRIDGES, PIERS, JETTIES, &c., in Iron, Wood, or
Stone. Also to supply Cranes, Girders, Turntables, and
Railway Work and Plant generally. (199)

TO SHIPBUILDERS.
IRON SHIPS may be rendered FIRE-
PROOF if internally fitted with Fibrous Slab in lieu of
Deal.
Extract from a letter of the Captain of the Royal Bride
Steamer, trading between Bristol and Melbourne:—"25th
May, 1859.—From my experience of the last nine months
in all climates, I have no hesitation in saying there is no
kind of lining I know of equal to your Fibrous Slab for
Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."
PATENT WOOD OR FIBROUS SLAB COMPANY,
(Limited)
15 Wellington-street North, Strand, London, W.C. (270)

EMIGRATION TO NEW YORK, CANADA,
AUSTRALIA, NEW ZEALAND, EAST INDIES,
CAPE OF GOOD HOPE, &c. All Classes of Passengers
booked throughout in the Finest Steam and Sailing Packets.
Full Particulars in our circulars for 1859, may be had gratis
on application to F. S. GRAY and Co., 64 King William
Street, City, and 6 Tower Hill, London; and at 25 Bath
Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—
Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-
hill, E.C. (243)

BALLOONS or Boats Driven by Steam.—
The common opinion that Balloons will never be
practicable for general travelling is erroneous—the action of
Parker's Small Steam Boats shows that they may be pro-
pelled at great speed; the Boats are driven by Steam
Rockets, which act upon the air. Fuel, a few drops of
spirits; Boats complete, 5 in. for a basin, 3s. post free;
13 in. for ponds, 5s. 6d. rail free.
JAMES PARKER, Inventor, 6 Lifford-road, Camberwell.
These Small Boats go twice the speed of any others with
half the fuel; a Steel Rocket of 150 lbs., steam pressure,
1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical
Balloon—with pointed ends, capable of carrying one pas-
senger—ten miles per hour. (350)

INDIA-RUBBER VALVES FOR STEAM
ENGINES, PUMP PACKING, &c.—Explanatory
Drawings and Information as to the best modes of fitting
and arranging the above, and all other Mechanical Ap-
plications of VULCANISED INDIA-RUBBER, are furnished
post-free by

CHARLES MACINTOSH & Co., Patentees,
Cambridge-st., Manchester, and 3 Cannon-st. West, London.
Manufactory and Depot, Cambridge-st., Manchester.
GENERAL WAREHOUSE, 3 Cannon-street West, London.
E.C.—C. M. and Co.'s only Establishment. (158)

RUSTON, PROCTOR, AND CO.,
LINCOLN AND KENNET WHARF, 67 UPPER THAMES STREET, LONDON;
AGRICULTURAL ENGINEERS AND MILLWRIGHTS.

MANUFACTURE
 PRIZE PORTABLE and FIXED STEAM ENGINES,
 SMITH'S PATENT STEAM PLOUGHS,
 PATENT PRIZE COMBINED THRASHING MACHINES,
 containing R. P. and Co.'s NEW PATENT CORN
 CLEANER,
 SAWING MACHINERY, CIRCULAR and VERTICAL of all
 Sizes,
 MILLS of all Kinds, FIXED and PORTABLE, for Grind-
 ing Bones, Flour, Linseed, Mortar, Clay, &c.
 PUMPS, CRANES, CRABS, SCREW-JACKS, &c.

Illustrated Catalogues, with full Particulars and Testi-
 monials, may be had by applying as above.

(34)

THE IMPERIAL IRON TUBE COMPANY,

(SUCCESSORS TO GEORGE B. LLOYD & CO.)

**GAS STREET AND BERKLEY STREET,
 BIRMINGHAM.**

Manufacturers of Wrought Iron Tubes & Fittings,

FOR GAS, STEAM, AND WATER.

PATENT GLASS ENAMELLED AND GALVANIZED TUBES,

AND

LAP-WELDED IRON BOILER TUBES.

(193)

**THE LONDON
 WARMING AND VENTILATING COMPANY,**

(LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by
 means of a modification of the plan successfully used during the last five years by
 Mr. Goldsborough Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are
 equally available for the process.

The cost is less and the effect greater than that of any other known
 means.

The Horticulturist will find herein
 an instrument of new and important
 powers.

The apparatus may be seen in
 ST. PAUL'S CATHEDRAL, the
 various offices of the "Department
 of Science and Art," and in many
 churches and other buildings.

Particulars and Testimonials, for-
 forwarded on application.

(12)

**W. BLACKETT.
 HOPE IRON WORKS.
 SOUTHWARK BRIDGE ROAD.
 LONDON.**

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and
 Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

TO BRASS-FOUNDERS, ENGINEERS, &c.

**THE PATENT PLUMB-
 RAGO CRUCIBLE COMPANY**
 having completed the enlargement
 of their premises, beg to call the
 attention of all users and shippers
 of Melting Pots to the great supe-
 riority of the PATENT CRUCI-
 BLES, which have been used dur-
 ing the last three years by some
 of the largest melters in England
 and abroad. In addition to their
 capabilities of melting an average
 of from thirty-five to forty pour-
 ings, they are unaffected by change
 of temperature, never crack, but
 can be used till worn out, requiring only one annual
 ing for several days' work, and become heated much
 more rapidly than ordinary pots, effecting thereby
 a saving of more than fifty per cent. in time, labour, fuel,
 and waste. The Patent Plumbago Crucible Company, also
 manufacture and import clay crucibles, muffles, portable
 furnaces, sublimate pans and covers, glass-pots, all descrip-
 tions of fire-standing goods, and every requisite for the
 assayer and dentists. For Lists, Testimonials, &c., apply
 to Battersea Works, London, S.W.

BESSEMER STEEL.—The Tenth Part of
 Bessemer's Patent for the Manufacture of Malleable
 Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C.,
 the Proprietor, by letter post paid, Porte Reine, Brussels,
 Belgium. See the Engineer of the 24th of June last.

(369)

LUND'S LONDON LEVER

**FOR Drawing
 Corks** is the most
 simple and effec-
 tive Instrument
 ever offered to the
 public for removing
 the Corks from Bot-
 tles without distur-
 bing the contents. The use of this Lever
 prevents the possibility of any injury to
 the hand by the accidental breaking of the
 neck of the Bottle.

Sold by all Cutlers and Ironmongers,
 and at the Patentee's Wholesale Ware-
 house, 23, 24, 25 Fleet Street, London.

A COURSE OF SIX LECTURES ON SOCIAL SCIENCE as a branch of School Instruction, especially addressed to Teachers, will be delivered in the Lecture Theatre, South Kensington, by William Ellis, on Tuesday evenings, the 11th, 18th, 25th October; 1st, 8th, and 15th November, 1859; at eight o'clock. Tickets will be issued at 3s. each for the course, or 1s. each Lecture, at South Kensington. By order of the Committee of Council on Education. (351)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c. Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT. Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

BOURDON'S PRESSURE and VACUUM GAUGES.—These instruments may be obtained from JAMES DEWARANCE & Co. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—Manchester—ALLEN, HARRISON, & Co., Cambridge-street; ROUTLEDGE, New Bridge-street, Salford. Glasgow—ALEXANDER MITCHELL, 350 Parliamentary-road. Belfast—GEO. H. STRYFE, York-street Foundry. Birmingham—ADAM DIXON, 48 Newhall-hill. Newport, Mon.—H. POOLEY & SON. Newcastle-on-Tyne—GEORGE HARLE, Dean-street. (305)

STEAM BOILERS.—The Patentee of an Improvement in Cornish Boilers wishes to meet with a Boiler-builder who would try some inexpensive experiments, in consideration of receiving one-third share of the Patent, which may prove of considerable value. Address, "Alpha," office of this Paper. (358)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JANES and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with despatch. Experienced Workmen sent to any part of the kingdom. (355)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (356)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.
THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 25 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."
(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.
Capt. Superintendent Charles Hope, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Ayles, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.
Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

THE INTERNATIONAL JURY AT PARIS Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.

John Abbott and Co., Park Works, Gateshead, Durham.

J. and E. Lumsden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Millbank Forge, Hartlepool.

Henry Wood and Co., Goree Piazza, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wight and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcens, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire. DEPOTS.

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Goree Piazza, Liverpool.

JOHN TROTMAN, PATENTEE, 42 CORNHILL, LONDON. (249)

WROUGHT-IRON GIRDER.—The Directors of the CALCUTTA and SOUTH-EASTERN RAILWAY COMPANY (Limited) invite TENDERS for the IRONWORK required for a BRIDGE of 128 feet 6 inches clear span for carrying the railway over Tolly's Canal, Calcutta.

Copies of the plans and specification (price £3 3s. per set) may be had on application at the offices of the consulting engineer, Mr. Longridge, No. 18 Abingdon-street, Westminster, on or after the 10th November, and tenders will be received at this office not later than noon on Friday, the 25th instant.

The Directors do not bind themselves to accept the lowest or any tender. C. G. FAGAN, Secretary.

211 Gresham-house, Old Broad-street, London, November 5, 1859. (399)

COALS.—The Three Pits Coal, nearly equal to the best Wall's-end, delivered free, 18s. per ton, may be ordered of the keepers of most of the branch Post-offices; or, by letter, of PLIMSOIL & MORTIMER, Coal Department, Great Northern Railway Station, King's-cross, N. (396)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth. Orders for Malleable Iron Castings executed within a week. (77)

AS MANAGER.—Wanted, by a practical Engineer and Draftsman, an engagement to superintend the erection and management of works and machinery, in which he has had over 20 years' practice. Satisfactory references as to respectability, qualifications, &c., will be given. Address, "Engineer," care of Messrs. Spon, 16 Bucklersbury, E.C., London. (391)

WANTED.—A Second-hand PAPER-MAKING MACHINE, or any Parts of Paper-Making Machinery.—Apply by letter, stating Price and Particulars, to O. R., care of Wm. Dawson & Sons, Advertising Agents, 74 Cannon-street, City, E.C. (374)

TO PATENT AGENTS, &c.

WANTED a Gentleman thoroughly conversant with, and able to Conduct, the Business of a Patent Agent in all its Branches and Departments, in the absence of the Principal. None but really competent persons need apply. Unexceptional references required.

Address, stating particulars and salary expected, to L. L., care of F. L. Lyne, Esq., 12 Pancras Lane, E.C. (368)

TO GUNMAKERS AND OTHERS INTERESTED IN THE MANUFACTURE OF FIRE-ARMS.

MR. C. FURBER is instructed to SUBMIT to PUBLIC COMPETITION, at the Mart, Bartholomew-lane, City, on Thursday, Nov. 17, at Twelve for One, by order of the Mortgagee, several valuable Patents granted to Mr. Prince for IMPROVEMENTS in FIRE-ARMS, better known as Prince's breech-loader, Prince's double-barrel gun, Prince's addition to breech-loader and a new cartridge, Prince's new breech-loading and self-priming rifle. In submitting these valuable patents to the notice of the public generally, and to the manufacturers in particular, it is necessary to state that these patents, among other advantages, possess simplicity, rapidity, precision, and economy, and offer to the trade at large, or to any energetic speculator, the certainty of a large and rapid fortune. The breech-loader may be denominated the patent of the day, having undergone every possible test, and having received universal approval. Its advantages have overcome every prejudice, and its unrivalled merit has been attested by thirteen of the most eminent gunmakers in London, in addition to the repeated encomiums passed upon it by Lord Elcho, Mr. Hans Buak, and the press. The applicability for cavalry, as well as a regulation rifle for other branches of the service, induces a belief that Her Majesty's government will recognise its value and proceed with further experiments, while the formation of rifle corps throughout the kingdom must of necessity create a large and increasing demand for such a rifle. The limits of an advertisement preclude the possibility of entering fully into the principles of the patents or their merits; suffice it to say, that the specifications and samples of the guns may be seen at Mr. Furber's offices, in Warwick-court, where particulars and every information may be obtained; as also of E. Fuller, Esq., solicitor, 39 Hatton-garden; and at the Auction Mart, London. (398)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarm when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts.

(215)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.

FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.

PRIZE OF £10 FOR FIXED STEAM ENGINE.

FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.

And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,

PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,

IMPROVED CIRCULAR-SAW BENCHES,

CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,

PATENT CORN-DRESSING MACHINES AND BLOWERS,

CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents.

(216)

THE RAILWAY CARRIAGE COMPANY,

OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE.

(273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslayi, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer. Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c. simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED.

(29)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LEECH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street.

(22)

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

(302)

VULCANISED INDIA-RUBBER MACHINE

BANDING is NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late DODGE, BACON, and Co., 44 St. Paul's Churchyard, London, E.C. (306)

FARRAR'S

PATENT FOR MAKING STEEL

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,

BATTERSEA WORKS, LONDON, &W

(313)

PATENT LEVER BREAKS for RAIL-

WAY WAGGONS, doing away with the objectionable Break Back. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 34 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent.

(375)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Packet Companies, are cheaper and more durable than the ordinary tubes.

Address GEORGE RICHARDSON and CO.,

New Broad-street, E.C.

(277)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 34in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 30in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C.

(284)

ENGINEERS' TOOLS FOR SALE—A

Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 8 in. plates. Two Ditto for 4 in. plates, and Two Ditto for 3 in. plates. VERTICAL DRILLING MACHINE; MILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RACLET BRACES, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London.

(283)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E. (345)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.
STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Threshing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & Sons' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL List will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

SMITH'S PATENT DOOR SPRINGS,

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET,
LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASEMENT
FASTENING AND SILL-BARS

are fitted by all to be the most perfect invention for the
Diagrams and List of Prices on application. (195)

are also
purpose.

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 45

CHADBURN BROTHERS'
PATENT METALLIC STEAM GAUGES.

THESE GAUGES have been in use more than three years, and have given general satisfaction. Those first fixed are now in as good working condition as ever. Testimonials, &c., may be seen at CHADBURN BROS.' Works, Sheffield. The Gauges may be had of all respectable Ironmongers in the country. (286)

RANSOMES AND SIMS,

WATER GAUGES—WATER GAUGES.
Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

WILCOX and Co., Millwall Pottery Company.

These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.

Extensively used on all the principal lines.

To be had only of **E. MOORE**, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.

•• Price List of Gauge Fittings, &c., on application. (94)

RANSOME'S PATENT STONE FILTERS.
of every description for Domestic purposes, for Manufactories, Public Companies, Shipping, &c.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

BESSEMER STEEL.—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 21st of June last. (363)

**SMALL GAS APPARATUS, WITH FREEDOM FROM
NUISANCE.**

**THE PATENT NATIONAL COAL-GAS
APPARATUS,**

FOR

Private Residences, Farm Buildings, Churches, Chapels,
Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,
J. T. B. PORTER and CO., Lincoln. (346)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

**TO ENGINEERS, MARINE, LOCOMOTIVE, AND
OTHER BOILER MAKERS; IRON-SHIP AND
BRIDGE BUILDERS; GAS AND RAILWAY COM-
PANIES, &c.**

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.
Mills—Tottenham, N. (360)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4½ in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lifford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (353)

NEW SMALL STEAM-BOATS.—These boats are propelled by steam rockets, and they go at least twice the speed of any other working models with half the fuel. On this plan, as the rockets could be made by thousands in the different ironworks of this country, a fleet of 10,000 gun-boats might be available for the defence of this country at a few weeks' notice. Any kind of vessel would do capable of carrying the gun and rockets. A rocket as an auxiliary power for a sailing vessel would give good way in a calm. The small boats are pretty interesting toys, 4½ ins. for a tray, 3 to 13 ins. for ponds, 5s. 6d., carriage free. **JAMES PARKER**, Inventor, 6 Lifford-road, Camberwell. (392)

**CONDY'S PATENT FLUID, or NATURAL
DISINFECTANT.**

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (238)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.

Address, M. E., 9 Parliament-street, Westminster. (304)

**PATENT STEAM PACKING, &c., &c.—
TUCK'S PATENT ELASTIC PACKING AND
PATENT METALLIC LIN-
INGS FOR STEAM ENGINES,
PUMPS, &c.**

ADVANTAGES.—A more perfect vacuum is obtained, Friction reduced, great saving in oil and tallow, and the Packing is gradually and completely worn away without becoming hard, THUS OBVIATING THE NECESSITY OF DRAWING THE OLD PACKING.

Orders received for the Patent Packing, also VULCANISED INDIA-RUBBER, in Sheets, Valves, &c., at the Offices,
35 CANNON-STREET, E.C. (304)

**ARTESIAN WELLS, BORING TOOLS,
PUMPS, &c.** Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

TO SHIPBUILDERS.

IRON SHIPS may be rendered **FIRE-PROOF** if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bridge Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

**EMIGRATION TO NEW YORK, CANADA,
AUSTRALIA, NEW ZEALAND, EAST INDIES,
CAPE OF GOOD HOPE, &c.** All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 44 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

FUEL AND STEAM ECONOMY.—
Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

BALLOONS or Boats Driven by Steam.

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell. These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

**INDIA-RUBBER VALVES FOR STEAM
ENGINES, PUMP PACKING, &c.**—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

(368)

RICHARD GARRETT AND SONS,
LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

Beg respectfully to call attention to their

NEWLY-INVENTED "FIXED" AND "PORTABLE" COMBINED FINISHING,
THRASHING, AND DRESSING MACHINES.

THESE MACHINES have been but recently introduced, and are adapted for preparing all kinds of Grain quite fit for market, in a thoroughly efficient manner. The points in which these new Machines more particularly excel may be stated as follows:

- 1st. Their compactness; being fully one-third less in size and bulk than the ordinary Machines hitherto in use for the same purpose.
- 2nd. The great reduction in the number of wearing parts. In these Improved Machines more than one-half the spindles, pulleys, bearings, and driving belts required for the ordinary Machines are dispensed with.
- 3rd. The novel arrangement by which the Dressing Apparatus is instantly varied, while the Machine is at work, to suit all kinds and conditions of grain.
- 4th. The very important saving in the cost of keeping the Machines in working order, consequent on the great reduction in the number of wearing parts.

B.—Catalogues in English, French, or German can be obtained FREE, on application being made to R. G. & SONS, at
LEISTON WORKS, SAXMUNDHAM, SUFFOLK.

314

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—Expositor.

Poisoned Water Preventable.
BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works,
108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected.

Every Variety of Gutta Percha Article.

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts.

(315)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.

FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.

PRIZE OF £10 FOR FIXED STEAM ENGINE.

FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.

And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,

PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN

FOR MARKET AT ONE OPERATION,

IMPROVED CIRCULAR-SAW BENCHES,

CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,

PATENT CORN-DRESSING MACHINES AND BLOWERS,

CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION,—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents.

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.

Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

3 " "		5 15

IMPROVED LIQUID MANURE
OR GENERAL PORTABLE PUMP.

These Pumps are fitted with J.
Warner and Son's Patent Bucket and
Valve, and cannot clog in action.
The Barrel is made of Galvanized
Iron, not likely to corrode, and can be
raised or lowered at pleasure on the
stand, the legs of which fold toge-
ther, and it may be carried with ease by
one man to tank or pond.

WARNER'S SWING WATER-BARROW.
(To hold Thirty Gallons), £3 3s.,

is intended for all large Establishments where
much watering is done by the watering-pot. By
its use much time and labour of the Gardener are
saved, particularly where the Tank, Pond, or
Pump is at a distance from the garden.

MUSICAL SHEEP BELLS, with
Straps, in sets of 6, 18s.; ditto,
in sets of 8, 25s.; ditto, in sets of
12, 38s.

BRASS SYRINGES, from 9s. to 18s.
CONSERVATORY PUMP, No. 567, with
Warner's Registered Spreader, 27s. 6d.

Galvanized Iron Tub GARDEN ENGINE, with
Warner's Registered Spreader, is strongly recom-
mended for durability and low price, viz., £2 15s.,
to hold Ten Gallons. Larger sizes, in either wood
or iron.

**WARNER'S CATTLE and SHEEP
BELLS,** in sets of 6, with Straps,
13s. per set.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c., cast for any size, note, or weight,
singly or in peals. Tuned by machinery. Stocked and wheeled ready for fixing. Old Bells re-cast or
taken in exchange.

The great 16-ton Bell, for the Houses of Parliament, was made by JOHN WARNER and SONS, 1856,
under their Patent.

The above may be obtained of any Ironmonger or Plumber, in town and Country;
or of the Patentees and Manufacturers.

(30)

LUND'S LONDON LEVER

FOR Drawing
Corks is the most
simple and effica-
cious Instrument
ever offered to the
public for removing
the Corks from Bot-
tles without disturb-
ing the contents. The use of this Lever
prevents the possibility of any injury to
the hand by the accidental breaking of the
neck of the Bottle.

Sold by all Cutlers and Ironmongers,
and at the Patentee's Wholesale Ware-
house, 23, 24, 25 Fleet Street, London.
(178)

TO BRASS-FOUNDERS, ENGINEERS, &c.

**THE PATENT PLUM-
BAGO CRUCIBLE COMPANY**
having completed the enlargement
of their premises, beg to call the
attention of all users and shippers
of Melting Pots to the great superi-
ority of the PATENT CRUCI-
BLES, which have been used dur-
ing the last three years by some
of the largest melters in England
and abroad. In addition to their
capabilities of melting an average
of from thirty-five to forty pour-
ings, they are unaffected by change
of temperature, never crack, but
can be used till worn out, requiring only one anneal-
ing for several days' work, and become heated much
more rapidly than ordinary pots, effecting thereby
a saving of more than fifty per cent. in time, labour, fuel,
and waste. The Patent Plumbago Crucible Company also
manufacture and import clay crucibles, muffles, portable
furnaces, sublimate pans and covers, glass-pots, all descrip-
tions of fire-standing goods, and every requisite for the
assayer and dentist. For Lists, Testimonials, &c., apply
to Battersea Works, London, S.W. 48

(310)

Now published, 8vo. cloth, Price 7s. 6d.

THE SHRAPNEL SHELL IN ENGLAND and in BELGIUM, with some reflections on the use of this Projectile in the late Crimean War. An Historical-Technical Sketch, by Major-General BORMANN, Aide-de-camp to his Majesty the King of the Belgians.

London: TRUBNER and CO., 60 Paternoster-row. (289)

ESTABLISHED 1700.

WINDOW BLINDS.—GEO. F. JAMES and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with despatch. Experienced Workmen sent to any part of the kingdom. (355)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (356)

PATENT WEDGE and GROOVED SURFACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their Works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Inclined-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow (146)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE POCKET STEREOSCOPIC PANORAMA.

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S, 85 King William-street, City. (345)

TO LOCOMOTIVE ENGINE BUILDERS, OR SUPERINTENDENTS.

A LOCOMOTIVE ENGINEER of Long Experience in the Manufacture of Railway Plant, is anxious to meet with an Engagement in any Capacity in which his services may be useful.

Address, Engineer, the Cottage, Cadogan Gardens, Sloane-street, Chelsea. (367)

WATER GLASS, or SOLUBLE SILICATES of SODA or POTASH, in large or small quantities, and either Solid or in Solution, at

ROBERT RUMNEY'S, Ardwick Chemical Works, Manchester. (335)

SELF-ACTING VALVE REGULATORS, Registered No. 4064.

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 3s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, R. RAMAGE, late FAIRB and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators, Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—

55A HOLYWELL-ST., MILLBANK, S.W., LONDON. (348)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield street, Borough-road, Southwark, S.E. (362)

TO WIRE ROPE MAKERS.—ARCHIBALD SMITH is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 60 Finsbury-street, Leicester-square, W. (196)

TO INVENTORS AND PATENTEEs.

MESSRS.

166 FLEET STREET, LONDON, E.C. (16)

MACHINERY of all Kinds DRAWN and ENGRAVED on WOOD, with the greatest accuracy of detail and Artistic Effect, by
J. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

FOR CORRECT FAMILY ARMS,
CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Herald's Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y paris Français, Italien, Allemand, et Hollandais.

The BEST are ALWAYS the CHEAPEST. Name-plates and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Herald's Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Herald's Office, No. 2, Old Jewry, E.C., two doors from Cheapside.—No charge for the Die. (322)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS,
OIL MERCHANTS,
Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Canoe Street. (28)

J. W. CLARE, C.E., Inventor of the Patent Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

GOLD and TEETH.—Messrs. BROWNE and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to STOP DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

GALVANIZED and CORRUGATED IRON and every description of Galvanized Iron Goods. W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E. All kinds of Iron-work Galvanized. (375)

THE IMPERIAL IRON TUBE COMPANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham, Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanized Tubes, and Lap-welded Iron Boiler Tubes. (347)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their FINE POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an indispensable powder, and warranted perfectly free from grit and any impurity. For ordinary polishing purposes it will be found superior to any Black Leads offered. Price £27 10s. per ton, £1 10s. per cwt.; samples of 25 lbs. forwarded on receipt of 2s. Packages free.

Address—
THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W. (334)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New), beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

LITHOGRAPHY AND WOOD ENGRAVING.

G. T. IZOD, Draughtsmen and Engravers on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated, Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. G. T. Izod and Co., Tudor-street, New Bridge-street, opposite the City Gas Works, London. (365)

ESTABLISHED 50 YEARS.—I. ASTON'S BOX AND IVORY RULE MANUFACTORY, No. 25 Old Compton-street, Soho. Surveyors' and Architects' Drawing Scales, T-Squares, Angles, Curves, Parallel Rules, Marquise Scales, Horse Measures, Standards for measuring Soldiers, Measuring Tapes, and every description of English and Foreign Rules and Scales made to order. All sorts of Rules repaired. Wholesale and Retail. (300)

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

IN all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,
Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (349)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels. STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

ESTABLISHED 1700.

EDWIN JEWITT, ENGRAVER ON WOOD and DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (34)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL.
104 ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

ISCA FOUNDRY COMPANY, OLD BARRACKS, NEWPORT, MON.
ENGINEERS, AND RAILWAY WAGON BUILDERS. Manufacturers of Switches, Points, and Crossings, Chairs, Spikes, Bolts, and General Railway Fittings. (279)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES.
18 DOCK-STREET, DUNDEE. (300)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,
J. T. B. PORTER and CO., Lincoln. (346)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business. Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, F.C. MILLS—Tottenham, N. (360)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4½ in. for lake tray, 3s.; 13 in. for ponds, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lifford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (333)

NEW SMALL STEAM-BOATS.—These boats are propelled by steam rockets, and they go at least twice the speed of any other working models with half the fuel. On this plan, as the rockets could be made by thousands in the different ironworks of this country, a fleet of 10,000 gun-boats might be available for the defence of this country at a few weeks' notice. Any kind of vessel would do capable of carrying the gun and rockets. A rocket as an auxiliary power for a sailing vessel would give good way in a calm. The small boats are pretty interesting toys, 4½ ins. for a tray, 3 to 13 ins. for ponds, 5s. 6d., carriage free. JAMES PARKER, Inventor, 6 Lifford-road, Camberwell. (392)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT,

Not only Deodorizes but Disinfects perfectly, and DESTROYES FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.
Free to Railway on receipt of Order or Stamp. (238)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, constructing Machinery, Preparing Drawings, &c. Address, M. E., 2 Parliament-street, Westminster. (304)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOUDDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

(388)

VINEGAR.—Patronised by Her Majesty's Government.
CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM,

Engineers and Iron Founders, North Hants Iron Works Basingstoke. (171)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Bruisers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Scythe, Garden Engines, Hand-saw Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions.

NOTE.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine **SMITH'S PATENT DOOR SPRINGS**, for Swing Doors, are stamped with Name and Address, thus—**SMITH, Patentee, 69 Prince-street, Leicester-square, London;** and that Springs thus marked are warranted. **SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS** are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (143)

PATENT STEAM PACKING, &c., &c.—TUCK'S PATENT ELASTIC PACKING AND PATENT METALLIC LININGS for STEAM ENGINES, PUMPS, &c.

ADVANTAGES.—A more perfect vacuum is obtained, Friction reduced, great saving in oil and tallow, and the Packing is gradually and completely worn away without becoming hard, THUS OBVIATING THE NECESSITY OF DRAWING THE OLD PACKING.

Orders received for the Patent Packing, also VULCANISED INDIA-RUBBER, in Sheets, Valves, &c., at the Offices,

35 CANNON-STREET, E.C.

(394)

ARTESIAN WELLS, BORING TOOLS, PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street, Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 3 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 120 feet in length, to work by hand or Steam Power.

Hot Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

TO SHIPBUILDERS.

IRON SHIPS may be rendered **FIRE-PROOF** if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

FUEL AND STEAM ECONOMY.—

Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. 243

BALLOONS or Boats Driven by Steam.—

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 3s. post free; 13 in. for ponds, 5s. 6d. tall free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell. These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Balloon—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c.—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 8 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments. (139)

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

(23)

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

THE LONDON WARMING AND VENTILATING COMPANY, (LIMITED),

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—MR. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(12)

IMPORTANT TO MANUFACTURERS, MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Furry Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strains, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Gr'vanic Batteries, &c., &c.

MANUFACTURED BY THE

NEW DISSOLVING VIEWS: CHINA and the CHINESE, with the ATTACK on the PORTS of the TIENTSIN-HOAH.
Lectures on CHEMISTRY, NATURAL PHILOSOPHY, the OXY-HYDROGEN MICROSCOPE, DIVER and DIVING-BELL, &c. Illustrations of SCOTTISH BALADS, by MR. FAIRBAIRN and the MRS. BENNETT. Evenings at Eight. (410)

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.
Youths intending to become Farmers, Land Stewards, Chemical and Manure Manufacturers, or Managers of Mining Property, will find the course of instruction in the College such as to fully qualify them for their respective pursuits. The term for Senior and Junior Students may be known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.
Analyses and Assays of every description are promptly and accurately executed in the Laboratories of the College. (320)

GENERAL PATENT COMPANY (Limited).

CHIEF OFFICE, 71 FLEET-STREET, E.C., LONDON.
This Company undertakes every description of business in connection with Patents, Inventions, and Designs, at the most moderate charges.—Capital advanced, and every assistance given in protecting, introducing, and disposing of inventions.—Agencies in every part of the United Kingdom and abroad. Printed information (gratis) on application to—

ROBERT M. LATHAM, Secretary.
Influential applications for agencies from unrepresented districts will be entertained, and liberal terms accorded.

BOURDON'S PRESSURE and VACUUM GAUGES.

—These instruments may be obtained from JOHN DEWAR & CO. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—
Manchester—ALLEN, HARRISON, & CO., Cambridge-street; Rotherham, New Bridge-street, Salford.
Glasgow—ALEXANDER MITCHELL, 350 Parliamentary-road.
Belfast—Geo. H. STRYKE, York-street Foundry.
Birmingham—ADAM DIXON, 48 Newhall-hill.
Newport, Mon.—H. POOLEY & SON.
Newcastle-on-Tyne—GEORGE HARLE, Dean-street. (395)

STEAM BOILERS.—The Patentee of an

Improvement in Cornish Boilers wishes to meet with a Boiler-builder who would try some inexpensive experiments, in consideration of receiving one-third share of the Patent, which may prove of considerable value. Address, "Alpha," office of this Paper. (388)

COALS.—The Three Pifs Coal, nearly equal to the best Wall's-end, delivered free, 19s. per ton, may be ordered of the keepers of most of the branch Post-offices; or, by letter, of PLIMMELL & MOTHERSILL, Coal Department, Great Northern Railway Station, King's-cross, N. (396)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM

"TROTMAN'S PATENT ANCHOR" to be superior to all others, possessing Thirty-Five Per Cent. more Holding Power than either Porter's or Roger's, and equivalent in all respects to ordinary Anchors of 28 per cent. greater weight.

"This appeared to the Committee of vast importance to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits of different descriptions of Anchors," sanctioned and approved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty "to investigate and determine the relative merits of Anchors," in compliance with a requisition from the principal Shipowners, Underwriters, &c., of the United Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chairman.

Capt. Superintendent Charles Hoppe, R.N., Her Majesty's Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's Ship "Nile."

Jonathan Ayles, Esq., R.N., Master Attendant, Her Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship "Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners' Society; Do. Mercantile Marine Board, London. Member of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine Board; Member of the Committee of "Lloyd's Register" of Shipping, &c.

William Phillips, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

George Marshall, Esq., Member of the Committee of "Lloyd's Register" of Shipping; General Shipowners' Society, &c.

Also awarded this Invention the First Class Medal, 1855.

Licensed Makers of Trotman's Improved Anchors:—

Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne.

John Abbott and Co., Park Works, Gatehead, Durham.

J. and E. Lumsden, Strand Iron Works, Sunderland.

N. Hingley and Sons, Cradley and Netherton Iron Works.

Proctor and Taylor, Milbank Forge, Hartlepool.

Henry Wood and Co., Gorse Piazza, Liverpool.

Wood Brothers, Chester, Wolverhampton, and Stourbridge.

R. Wright and Sons, Iron Works, Sunderland and Seaham.

Pow and Fawcus, 49 Lr. Shadwell, London, and North Shields.

John Gilbert, Cradley Heath, Staffordshire.

Derôrs,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London, and at 4 Gorse Piazza, Liverpool.

JOHN TROTMAN,

PATENTEE, 42 CORNHILL, LONDON. (249)

STOVES.—The only Stoves for which a Prize

Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for sixteen hours with one supply of fuel, requiring no attention. These are WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

PARTNERSHIP.—The ADVERTISER is

desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE OFFICE, 166 Fleet-street. (361)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a week. (77)

AS MANAGER.—Wanted, by a practical

Engineer and Draftsman, an engagement to superintend the erection and management of works and machinery, in which he has had over 20 years' practice. Satisfactory references as to respectability, qualifications, &c., will be given. Address, "Engineer," care of Messrs. Spow, 16 Bucklersbury, E.C., London. (391)

WANTED.—A Second-hand PAPER-MAKING MACHINE, or any Parts of Paper-Making Machinery.—Apply by letter, stating Price and Particulars, to O. R., care of Wm. Dawson & Sons, Advertising Agents, 74 Cannon-street, City, E.C. (374)

TO ENGINEERS, &c.

WANTED.—An Energetic and Competent

Working Foreman, capable of taking the management of workmen and apprentices in an engineer's and brass-foundry business, &c., &c. He must be a thorough mechanic, draughtsman, and pattern-maker, able to work at the vice or lathe, and reside on the premises and devote attention to the business at all times. One accustomed to steam-ship, crane, and pump work preferred. Address, by letter, pre-paid—stating salary required and where last employed, in confidence—to S. T., MECHANICS' MAGAZINE Office, 166 Fleet-street. Also, two or three first-class Mechanics wanted.—Apply as above. (401)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS

FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarm when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

METROPOLITAN BOARD OF WORKS.—

MAIN DRAINAGE of METROPOLIS.—SOUTHERN OUTFALL TUNNEL SEWER.—To BUILDERS and CONTRACTORS experienced in Tunnel Works.—The Metropolitan Board of Works hereby give notice, that they will MEET in the Council Chamber, Guildhall, in the City of London, on Friday, the 6th day of January, 1860, at Twelve o'clock at Noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a MAIN BRICK SEWER, 7 miles 2,240 feet in length, or thereabouts (5,000 feet of this length being in tunnel), and for the execution of other works in connection therewith; such sewer to extend from a point in Erith Marshes, opposite Dagenham Reach, in the county of Kent, to Woolwich, and through and under Woolwich to Norman's-road, otherwise North Pole-lane, Greenwich, in the same county.

Parties desirous of submitting tenders may, upon payment of £3, obtain plans, sections, specification, form of tender, and other particulars on application to J. W. Bazalgette, Engineer of the Board, at the office of the Board, between the hours of Nine a.m. and Four p.m.

Tenders, addressed to the Metropolitan Board of Works, must be delivered at the office of the Board, No. 1, Greek-street, Soho, before Four o'clock p.m. on Thursday, the 5th day of January, 1860, and no tender will be received after that hour.

The Board do not bind themselves to accept the lowest or any tender, and the party whose tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.

No. 1 Greek-street, Soho, November 17, 1859. (408)

GALVANIZED and CORRUGATED IRON

and every description of Galvanized Iron Goods.

W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.

All kinds of Iron-work Galvanized. (375)

FULLER BROTHERS, WINDOW BLIND

MANUFACTURERS, 45 High-street, Borough (near Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (396)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Threshing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts.

(215)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.

FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.

PRIZE OF £10 FOR FIXED STEAM ENGINE.

FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as for Finishing the Corn for Market.

And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,

PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN

FOR MARKET AT ONE OPERATION,

IMPROVED CIRCULAR-SAW BENCHES,

CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,

PATENT CORN-DRESSING MACHINES AND BLOWERS,

CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents.

(315)

THE RAILWAY CARRIAGE COMPANY,

OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description.

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE.

(273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer. Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,

81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED.

(28)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street.

TO INVENTORS.

Two Ditto for 1 in. plates, and Two Ditto for 1 in. plates. VERTICAL DRILLING MACHINE; MILLAR and BENCH DRILLS; HALET'S and other LIFTING JACKS; RATCHET BRACER, &c.

Apply to PAGE and CAMERON, 64 Old Broad-st., E.C. London. (286)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUOUFF'S IMPROVED STEAM AND VACUUM GAUGES.

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

LAWRIE AND HAGGER, Metal Brokers
33 Lombard-street, E.C.

LIST OF MISCELLANEOUS TENDERS IN VITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

CHURCH, Ripley, Derby.—For the erection of a new tower, chancel, and vestry; extension of nave, and sundry alterations and additions to the parish church of Ripley. Plans, office of Mr. R. Barber, architect, Eastwood, Nottingham. Tenders to Dec. 17.

SMALL SCREW STEAMER, France.—For river navigation, capable of carrying 15 to 20 tons of iron in bars 20 feet long. Address with particulars to Messrs. Adrien, Langlois and Co., Maitres de Forges à Basse Indrie, près Nantes, Loire Infer., France.

PIG IRON, India House.—Conditions at the Secretariat office, where proposals before eleven, Nov. 29.

COPPER, Navy.—For supplying Her Majesty's Dockyard at Chatham with copper in ingots of 112 lbs. each, 60 tons; copper in ingots of 140 lbs. each, 70 tons; copper in ingots about 14 lbs. each refined without lead, 30 tons; tough cake copper, 40 tons. Conditions of contract and form of tender at the office of the Storekeeper-General, Somerset-place, where tenders to 2 o'clock, Nov. 29, addressed to the Secretary of the Admiralty, and be accompanied by a letter signed by two sureties and the person tendering for £5,000.

COALS, Navy.—For supplying and delivering into Her Majesty's Victualling stores at Plymouth 1,000 tons of Bryndorway, Graigola, Resolvie, Llangenneck, Newport, Merthyr, or Aberaman Merthyr coals. To be delivered in 24 weeks in four instalments at intervals of six weeks. Form of tenders, Victualling-yard, Plymouth, the officer conducting the packet-service, Liverpool, or collector of customs, Bristol. Attention is called to the modification of conditions. Tenders to 1.30, Dec. 1, to Secretary of Admiralty, Somerset-house.

SUPPLY OF MATERIALS, Greenwich Hospital.—For one year, and three months' notice to continue or discontinue. To include bricklayers and plasterers, masons, slaters, plumbers (lead, pipe, and tin), brass-founders (cocks, &c.), carpenters (timbers, deals, &c.), smiths (cast and wrought-iron, &c.), ironmongers, locksmiths, bell-hungers, and tinmasons, gasfitters, painters, &c. Printed forms, Inspector of works, at the Hospital. Tenders, noon, Dec. 8, to Secretary of the Hospital.

TENDERS FOR OLD RAILS.—The Directors of the North British Railway are prepared to receive tenders for the sale of 800 tons of old rails, to be delivered either at Leith station or St. Margaret's station, near Edinburgh. Particulars, locomotive superintendent, St. Margaret's. Tenders at the secretary's office, Canal-street, Edinburgh, noon, Nov. 30.

PONTOON SHED, Sandhurst, Berks.—For a pontoon shed at the Royal Military College, Sandhurst. Parties desiring to tender for the erection of these works must leave their names at the Royal Engineer Office, Aldershot, on 29th inst., and pay the sum of half-a-guinea for the bills of quantities.

BRIDGE, Pilkington and Radcliffe.—For widening Radcliffe-bridge. Plans, &c., office of Wm. Radford, bridge-master, 41 John Dalton-street, Manchester. Tenders to the Radcliffe-bridge Committee, sealed and endorsed Radcliffe-bridge Committee.

BRIDGE, Pembroke, Herefordshire.—For building a new stone bridge over the river Arrow at Pembroke. Plans, &c., office of Mr. John Cleave, clerk of the peace, Shire-hall, Hereford, and office of Mr. John Gray, county surveyor, King's-acre, near Hereford. Tenders, Dec. 20.

SCHOOL, Wootton Bassett, Wiltshire.—For the erection of new school-buildings. Plans, &c., office of Edward W. Mantell, architect, Swindon. Tenders, Dec. 10.

POLICE STATION, Over Darwen.—Plans, Mr. Inspector McDonald, police station, Over Darwen. Tenders to Mr. Superintendent Higgins, King-street, Blackburn, to Dec. 30.

ARCADE, SHOPS, BILLIARD-ROOM, &c., Tynemouth.—For the whole or any portion of the work. Plans and bills of quantities, office of Mr. Archibald M. Dunn, architect to the Directors of the Tynemouth Assembly and Promenade Company (Limited), Market-street, Tynemouth, where tenders, noon Nov. 29.

PRINTING OFFICES, Nottingham.—For the erection of extensive printing offices with warehouses and sale shops adjoining. Plans, &c., office of Mr. W. Booker, architect, High Pavement, Nottingham. No date given.

FARMHOUSE AND PREMISES, Shobdon-court, near Leominster, Herefordshire.—For the erection of a farmhouse and premises, comprising stable, loft, granaries, sheds, hospital yards, &c. Plan, office of E. Lloyd, Esq., solicitor, Leominster. Tenders to Dec. 8.

HOUSE, Calverley.—For the masons', plumbers', plasterers', slaters and painters' work in villa residence and outbuilding. Drawings, office of Mr. Geo. Smith, surveyor, 171 Park-lane, Leeds. Tenders, Dec. 1.

ROOFING, Wolverhampton.—For the roofing in of the whole of the central area of the Market Hall, and for sundry fittings and stalls therein. Plans and specifications. Mr. Geo. Bidlake, architect, and tenders to Markets Committee of Town Council, Dec. 3.

LANTHORN OUTFALL TUNNEL, SEWER, London.—For the construction of a made brick sewer seven miles 3,240 feet in length (5,000 feet of this length being in tunnel), and for the execution of other work in connection therewith; such sewer to extend from a point in Erith marshes to Woolwich, and through and under Woolwich to Norman's-road, Greenwich. Plans, section, and form of tender for £3 from Mr. J. W. Basalgette, engineer of the board, 1 Greek-street, Soho, where tenders before 4 p.m. Jan. 5.

LEVELLING TEN STREETS, Wolverhampton.—For levelling, paving, curving, channelling, and draining, to be executed according to plans, sections, and specifications to be seen at the Borough Surveyor's office. Tenders sealed and addressed to the Chairman of the Streets Committee, 3rd Dec.

STREETS, COLVERTS, &c., Larches Estate, Wolverhampton.—Plans, &c., office of Messrs. Walker, Lloyd, and Walters, surveyors and auctioneers, Exchange-street. Tenders, 29th November, to the Chairman of the Second Wolverhampton Freeholders Building Society, 1 King-street, Wolverhampton.

MAKING NEW ROAD, Handsworth, near Birmingham.—Plan, section, and specification, offices of E. & C. Robins, surveyors and auctioneers, New-street, Birmingham.

PAVING, Oxford.—For providing and laying York curb and paving for footways, and granite paving for roadways, and other works, for the Oxford Paving Commissioners for the term of one year from January 1st, 1860. Specifications and particulars, Commissioner's office, Town-hall-yard, daily from 9 till 4, or by letter addressed to Mr. Galpin, surveyor.

PLANS FOR BATHS, Lytham.—Two premiums, namely, twenty guineas and ten guineas respectively for the first and second best designs of such structures as shall not involve an expenditure of more than £3,000. Plans, &c., Estate Office, Lytham, Jan. 1st.

ACCOUNTANT TO ENGINEERING DEPARTMENT, Madras Railway Company.—Salary according to qualification, but not to exceed £500 a-year. Engagement four years, and free passage out. Applications, with testimonials and particulars of age, and previous employment, at the offices, 33 New-Broad-street, London, until the 25th inst.

TO ENGINEERS.—An agent for England to manufacture and supply railway companies with Thompson's Patent Gas Apparatus for lighting trains or carriages with gas. System, high pressure, as in North America. Messrs. Prince and Co., Patent office, 4 Trafalgar-square, Charing-cross.

MECHANICAL DRAUGHTSMEN.—A first-class man who has been employed in some well-known marine engine factory, and can produce first-class testimonials. Address, Martin Samuelson and Co., Hull. A marine engine draughtsman for an old established concern in the country to take the lead in the office. A thoroughly competent person will be liberally dealt with. Address, Mr. Matthew Soul, 3 Leadenhall-street, London, E.C.

ENGINEERS' FOREMAN OR MANAGER in the absence of the Principal in a small Engineer's factory in the South of England. To be acquainted with every description of steam and general machinery, and capable of setting out and making plain drawings. Full particulars, with salary, to S. M. F., Southampton.

WORKING FOREMAN.—Capable of taking the management of workmen and apprentices in an engineer's and brass foundry business. A thorough machine draughtsman and pattern-maker, able to work at vice or lathe, and to live on the premises. One accustomed to steam-ship, crane, and pump-work, preferred. Address, S. T., office of this paper. Also two or three first-class mechanics. Apply as above.

BESSEMER STEEL.—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 24th of June last. (363)

CHUBB'S LOCKS, FIREPROOF SAFES, CASH AND DEED BOXES.

Complete lists of sizes and prices may be had on application.

CHUBB AND SON,
57 St. PAUL'S CHURCHYARD, LONDON;
28 Lord-street, Liverpool; 16 Market-place, Manchester
and Wolverhampton. (4)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

BALLOONS or Boats Driven by Steam.

The common opinion that Balloons will never be practicable for general travelling is erroneous—the action of Parker's Small Steam Boats shows that they may be propelled at great speed; the Boats are driven by Steam Rockets, which act upon the air. Fuel, a few drops of spirits; Boats complete, 5 in. for a basin, 30 post free; 13 in. for ponds, 3s. 6d. rail free.

JAMES PARKER, Inventor, 6 Lifford-road, Camberwell. These Small Boats go twice the speed of any others with half the fuel; a Steel Rocket of 150 lbs., steam pressure, 1,000 lbs. (1-20th of gunpowder) would drive a Cylindrical Rocket—with pointed ends, capable of carrying one passenger—ten miles per hour. (350)

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY,

AND PROMOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR
GLENFIELD PATENT STARCH,
SEE THAT YOU GET IT,

as inferior kinds are often substituted.
Sold by all Chandlers, Grocers, &c., &c. (75)

THE IMPERIAL IRON TUBE COM-

PANY (Successors to GEORGE R. LLOYD & Co.), Gas-street and Berkley-street, Birmingham. Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (347)

ARTESIAN WELLS, BORING TOOLS,

PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Men and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles. Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)
15 Wellington-street North, Strand, London, W.C. (270)

EMIGRATION TO NEW YORK, CANADA,

AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c. All Classes of Passengers booked throughout in the Fleet Steam and Sailing Packets. Engravings, with Price Lists, forwarded on application, post-free.
(303)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

(388)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d.
(216)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform, that all genuine

SMITH'S PATENT DOOR SPRINGS.

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET, LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS

are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application.

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentists. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

DRAUGHTS OF COLD AIR and DUST round Room, Office, or outside Doors and Windows EFFECTUALLY PREVENTED BY GREENWOOD'S PATENT INDIA-RUBBER STOPS, the most simple and effectual method of making air-tight joints to joiners' or cabinet work, old or new. These Stops can be had any length or pattern. Self-acting Spring Stops, for the bottoms of doors.

The Trade supplied.

JOHN GREENWOOD, Patentee, 10 Arthur-street West, London-bridge.
(334)

PATENT STEAM PACKING, &c., &c.—TUCK'S PATENT ELASTIC PACKING AND PATENT METALLIC LININGS FOR STEAM ENGINES, PUMPS, &c.

ADVANTAGES.—A most perfect vacuum is obtained, Friction reduced, great saving in oil and tallow, and the Packing is gradually and completely worn away without becoming hard, THUS OBVIATING THE NECESSITY OF DRAWING THE OLD PACKING.

Orders received for the Patent Packing, also VULCANISED INDIA-RUBBER, in Sheets, Valves, &c., at the Offices,

35 CANNON-STREET, E.C.

(304)

BODMER'S PATENT SAFETY VALVE.

—In this Safety Valve the force which raises the cap (a) is derived from the steam pressure exerted upon a column of water, admitted from the boiler through the pipe (b), and is therefore quite independent of the steam which is about to escape. The valve is consequently exceedingly sensitive, and capable of opening to the full extent of its area, especially in the case of a sudden accumulation of steam from whatever cause.

For further information apply to Messrs.

R. & L. R. BODMER, 2 Thavies' Inn, Holborn, or to Mr. Wm. ROUTLEDGE, New Bridge Foundry, Salford, Manchester.
(410)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S LONDON RACK CORK SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlers and Ironmongers.

(280)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Stations, And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers, J. T. B. PORTER and CO., Lincoln. (346)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c.—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of VULCANISED INDIA-RUBBER, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments (139)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO., India-rubber Manufacturers, 9 Gresham-street West, E.C. MILLS—Tottenham, N. (360)

STEAM BALLOONS.—Much more propelling power is obtained by Steam Rockets than by the Marine Engine from same amount of fuel. At low pressure little Rocket Boats go twice as quick as any others with half the fuel. At great pressure the propelling power is equal to one-third the whole weight of the engine, and thus is solved the problem of aerial navigation by steam balloons. Small boats complete, (pretty interesting toys) 4½ in. for lake tray, 3s.; 13 in. for pond, 5s. 6d.; both rail free. James Parker, Inventor, 6 Lilford Road, Camberwell. Fuel, a few drops of spirits. Steam up in half-a-minute, and lasts five. (353)

NEW SMALL STEAM-BOATS.—These boats are propelled by steam rockets, and they go at least twice the speed of any other working models with half the fuel. On this plan, as the rockets could be made by thousands in the different ironworks of this country, a fleet of 10,000 gun-boats might be available for the defence of this country at a few weeks' notice. Any kind of vessel would do capable of carrying the gun and rockets. A rocket as an auxiliary power for a sailing vessel would give good way in a calm. The small boats are pretty interesting toys, 4½ ins. for a tray, 3 to 13 ins. for ponds, 5s. 6d., carriage free. JAMES PARKER, Inventor, 6 Lilford-road, Camberwell. (392)

CONDY'S PATENT FLUID or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and destroys even the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (238)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (364)

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.

SELF-PROPELLING AND TRACTION ENGINES.

From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.

STONE GRINDING MILLS.

MORTAR AND PUG MILLS.

MILLWRIGHTS' WORK of all kinds.

SAWING MACHINERY, from 4 to 20 Horse Power.

BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.

PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.

THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.

CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.

BARLEY AVELLING MACHINES.

CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.

PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.

PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.

PRIZE SEED AND MANURE DRILLS.

LIQUID, SEED, AND MANURE DROP DRILLS.

CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.

GARRETT'S PATENT HORSE HOK for all Crops.

PATENT REVOLVING HOES for Root Crops.

IMPROVED PLOUGHS AND REAPING MACHINES.

&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor*.

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not delayed in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

Every Variety of Gutta Percha Article.

KENNINGTON AGRICULTURAL AND CHEMICAL COLLEGE, Lower Kennington-lane near London.

PRINCIPAL—J. C. NESBIT, F.G.S., F.C.S., &c.
Youths intending to become Farmers, Land Stewards,
Chemical and Manure Manufacturers, or Managers of
Mining Property, will find the course of instruction in the
College such as to fully qualify them for their respective
pursuits. The term for Senior and Junior Students may be
known on application to the Principal.

ANALYTICAL AND ASSAY DEPARTMENT.
Analyses and Assays of every description are promptly
and accurately executed in the Laboratories of the
College. (320)

GENERAL PATENT COMPANY (Limited).

CHIEF OFFICE, 71 FLEET-STREET, E.C., LONDON.
This Company undertakes every description of business
in connection with Patents, Inventions, and Designs, at
the most moderate charges.—Capital advanced, and every
assistance given in protecting, introducing, and disposing
of inventions.—Agencies in every part of the United King-
dom and abroad. Printed information (gratis) on applica-
tion to—

ROBERT M. LATHAM, Secretary.
Influential applications for agencies from unrepresented
districts will be entertained, and liberal terms accorded.

BRICK AND TILE MACHINES, &c., &c. CLAYTON'S PATENTS.

During the B. C. Cartle Show, December 6th to 9th,
HENRY CLAYTON & Co., at Stands Nos. 630 to 636, will
Exhibit their Hand-power Patent Brick-making Ma-
chinery, Harvesting Machinery, Drainage Implements,
&c., &c.

As the space at the Show does not admit of the exhibition
of their larger Machines, H. C. & Co. solicit the personal
inspection by all parties interested in this class of machi-
nery of their recent improvements, and of the several
sizes of the machines on view (some in operation) at their
manufactory, during the show days, from 11 a.m. to
3 p.m. Five minutes walk from the Show.

ATLAS WORKS,
Upper Park-place, Dorset-square. (411)

COALS.—The Three Pits Coal, nearly equal
to the best Wall's-end, delivered free, 19s. per ton,
may be ordered of the keepers of most of the branch Post-
offices; or, by letter, of PLIMSOIL & MOTHERSILL, Coal
Department, Great Northern Railway Station, King's-
cross, N. (396)

TO SHIPBUILDERS, SHIPOWNERS, CAPTAINS, &c.

THE ANCHOR COMMITTEE AFFIRM "TROTMAN'S PATENT ANCHOR"

to be superior to all others, possessing Thirty-Five Per
Cent. more Holding Power than either Porter's or Roger's,
and equivalent in all respects to ordinary Anchors of 28 per
cent. greater weight.

"This appeared to the Committee of vast importance
to the Shipping Interests, &c."

(Vide their Official Report, 1853, "On the relative merits
of different descriptions of Anchors," sanctioned and ap-
proved by the Admiralty.)

THE ANCHOR COMMITTEE

Nominated by the Lords Commissioners of the Admiralty
"to investigate and determine the relative merits of
Anchors," in compliance with a requisition from the prin-
cipal shipowners, Underwriters, &c., of the United
Kingdom.

Rear-Admiral the Hon. Sir M. Stopford, K.C.B., Chair-
man.

Capt. Superintendent Charles Hope, R.N., Her Majesty's
Dockyard, Sheerness.

Captain George Rodney Munday, R.N., Her Majesty's
Ship "Nile."

Jonathan Ayleen, Esq., R.N., Master Attendant, Her
Majesty's Dockyard, Sheerness.

James Tonkin, Esq., Master, R.N., Her Majesty's Ship
"Waterloo," 120 guns.

William Schaw Lindsay, Esq., M.P., &c., &c.

Duncan Dunbar, Esq., Chairman of General Shipowners'
Society; Do. Mercantile Marine Board, London. Member
of the Committee of "Lloyd's Register" of Shipping, &c.

Anthony Ridley, Esq., Vice-Chairman of Mercantile
Marine Board; Member of the Committee of "Lloyd's
Register" of Shipping, &c.

William Drew, Esq., Member of the Mercantile Marine
Board; Member of the Committee of "Lloyd's Register"
of Shipping, &c.

William Phillips, Esq., Member of the Committee of
"Lloyd's Register" of Shipping; General Shipowners'
Society, &c.

George Marshall, Esq., Member of the Committee of
"Lloyd's Register" of Shipping; General Shipowners'
Society, &c.

Also awarded this Invention the First Class Medal, 1855.

THE INTERNATIONAL JURY AT PARIS

Licensed Makers of Trotman's Improved Anchors:—
Messrs. Hawks, Crawshaw, and Sons, Newcastle-on-Tyne,
" John Abbott and Co., Park Works, Gateshead,
Durham,
" J. and E. Lumsden, Strand Iron Works, Sunder-
land,
" N. Hingley and Sons, Cradley and Netherton Iron
Works,
" Proctor and Taylor, Milbank Forge, Hartlepool,
" Henry Wood and Co., Gorce Piazzas, Liverpool,
" Wood Brothers, Chester, Wolverhampton, and
Stourbridge,
" R. Wight and Sons, Iron Works, Sunderland and
Seaham,
" Pow and Fawcus, 49 Lr. Shadwell, London, and
North Shields,
" John Gilbert, Cradley Heath, Staffordshire.

DEPOTS,

GEORGE WOOD & CO., 14 Fore-st., Limehouse, London,
and at 4 Gorce Piazzas, Liverpool.

JOHN TROTMAN,
PATENTEE, 42 CORNHILL, LONDON. (249)

PARTNERSHIP.—THE ADVERTISER IS

desirous of entering as Junior Partner in an Engi-
neering and Ship-building concern. He has several highly
useful Inventions applicable to Steam and Shipbuilding,
which he would Patent in the name of the firm. He is
capable of Designing and making Finished and Working
Drawings of Ships, Steam Engines, &c., and would devote
his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-
street. (381)

GALVANIZED and CORRUGATED IRON

and every description of Galvanized Iron Goods.
W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.
All kinds of Iron-work Galvanized. (375)

FULLER BROTHERS, WINDOW BLIND

MANUFACTURERS, 45 High-street, Borough (Four
Doors from L. B. Railway), London. The Trade supplied
on the lowest terms. Well-seasoned Blinds for Exporta-
tion. Orders punctually attended to. (356)

HART & SON, MALLEABLE IRON- FOUNDERS, 4 Vine-street, York-road, Lambeth.

Orders for Malleable Iron Castings executed within a
week. (77)

AS MANAGER.—Wanted, by a practical
Engineer and Draftsman, an engagement to superin-
tend the erection and management of works and machinery,
in which he has had over 20 years' practice. Satisfactory
references as to respectability, qualifications, &c., will be
given. Address, "Engineer," care of Messrs. Spon,
16 Bucklersbury, E.C., London. (391)

A HIGH PRESSURE ENGINE AND BOILER of Six-horse power, for Sale. May be

seen at work; together with Forty-five feet of Wrought
Iron Turned Shafting; Drums, Pulleys, &c. Particulars,
prices, &c. on application at the Kent Iron Works, Bridge-
street, Greenwich. (413)

ENGINEERS' MACHINES AND TOOLS FOR SALE.

A PLANING MACHINE to plane six feet
by thirty inches. Two Boring and Drilling Machines
with drills and rosebits. A Bolt Screwing and a Nut
Shaping Machine. Single and double-acting Machines to
Punch and Shear Plate-Iron from a quarter of an inch up
to one inch thick, portable and for fixing. A Boiler-plate
Heating Furnace of Cast and Wrought Iron. Anvils.
Parallel Vices. Haley's Screw Jacks. Gas-tube Screwing
Tackle. Blocks and Pulleys, &c.
Engravings, Particulars, and Prices on application at
Kent Iron Works, Bridge-street, Greenwich. (414)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simpli-
city; it also acts as an Alarm when the water falls low
in the boiler. For a description, with Engravings, see the
MECHANICS' MAGAZINE for October 28th. Testimonials
have been given as to their efficiency by many eminent
Engineers, and they are not expensive. For further par-
ticulars apply to the Patentee, whose works are at
No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson,
Civil and Mechanical Consulting Engineer, 9 Buckingham-
street, Strand, London, where they also may be seen. (377)

METROPOLITAN BOARD OF WORKS.— MAIN DRAINAGE of METROPOLIS.— SOUTHERN OUTFALL TUNNEL SEWER.—To

BUILDERS and CONTRACTORS experienced in Tunnel
Works.—The Metropolitan Board of Works hereby give
notice, that they will MEET in the Council Chamber,
Guildhall, in the City of London, on Friday, the 6th day of
January, 1860, at Twelve o'clock at Noon precisely, and
will then be prepared to open TENDERS by parties who
may be willing to CONTRACT for the CONSTRUCTION
of a MAIN BRICK SEWER, 7 miles 2,240 feet in length,
or thereabouts (5,000 feet of this length being in tunnel),
and for the execution of other works in connection there-
with; such sewer to extend from a point in Erith Marshes,
opposite Dagenham Reach, in the county of Kent, to
Woolwich, and through and under Woolwich to Norman's-
road, otherwise North Pole-lane, Greenwich, in the same
county.

Parties desirous of submitting tenders may, upon pay-
ment of £3, obtain plans, sections, specification, form of
tender, and other particulars on application to J. W.
Bazalgette, Engineer of the Board, at the office of the
Board, between the hours of Nine a.m. and Four p.m.

Tenders, addressed to the Metropolitan Board of Works,
must be delivered at the office of the Board, No. 1 Greek-
street, Soho, before Four o'clock p.m. on Thursday, the
5th day of January, 1860, and no tender will be received
after that hour.

The Board do not bind themselves to accept the lowest
or any tender, and the party whose tender shall be ac-
cepted will be required to provide two approved sureties
for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.
No. 1 Greek-street, Soho, November 17, 1859. (406)

PARKER'S SMALL STEAM-BOATS, PROPELLED BY STEAM-ROCKETS.

To Mr. Bischoff, Shipbuilder and Engineer, Elbing—
Have you an Agent in London to whom the Boat may be
given?

The Rocket of the 13 in. Boat weighs 1 oz., and it propels
a Boat of 7 ft. with 20 lbs. The fire for the small Boats is
obtained from a little spirits. Boats 4½ in. for a basin 3s.,
post-free; 13 in. for ponds, 5s. 6d., rail-free.

JAMES PARKER, Inventor, 6 Lifford-road, Camber-
well. (457)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam. The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier, Tines or Broad Shares, &c. Any Engine now used by Farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it. The Engine can be used for Threshing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place. These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes. Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER Farmer, Hatfield, Herts. (215)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,
SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gera, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,
SPITLEGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.
For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE—34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description.

RAILWAY PLANT AND IRONWORK.
NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (89)

NORTON'S GOSSAMER CARTRIDGES, FOR MILITARY FIRE-ARMS.

These Cartridges are Manufactured by Mr. JAMES LETCH, Gunmaker, 68 Margaret-street, Regent-street, and by DAW, of Broad-street. 227

TO INVENTORS.

INDIA-RUBBER APPARATUS

OF EVERY KIND MADE TO ORDER.

L. J. LAVATER, INDIA-RUBBER MANUFACTURER,
441 Strand, London, W. (302)

VULCANISED INDIA-RUBBER MACHINE

BANDING IS NOT AFFECTED BY WET, HEAT, OR COLD; does not stretch nor slip on the pulleys. HOSES for BREWERIES, &c., will not impart TASTE, SMELL, or COLOUR: also for conducting, or steam purposes. Washers, Valves, Sheets, Printing Blankets, &c., in Stock. Other Articles made to order. All Goods warranted to stand 300° Fahrenheit.

N.B.—Sole Contractors to the Lords Commissioners of the Admiralty.

DODGE and GIANDONATI (late Dodge, Bacon, and Co.,
44 St. Paul's Churchyard, London, E.C. (208)

FARRAR'S

PATENT FOR MAKING STEEL

In Three Hours in the Crucible, without Cementation.

For Licenses to use Process and further Particulars, apply to

THOS. VAUGHAN MORGAN,
BATTERSEA WORKS, LONDON, S.W. (313)

PATENT LEVER BREAKS for RAILWAY WAGGONS, doing away with the objectionable Break Rack. Can be applied to existing stock at a trifling expense. Royalty moderate.

Models can be seen at 31 Great George-street, Westminster, and the Breaks in action at the Works of the Railway Carriage Company at the Peterborough Station, on the Eastern Counties Railway; the Rugby Station, London and North-Western Railway; the Cardiff Docks Station, Taff Vale Railway; and at the Works, Oldbury, near Birmingham, where all communications are requested to be sent. (275)

BRASS AND COPPER TUBES.

MUNTZ'S PATENT SOLID ROLLED BRASS AND COPPER TUBES, now extensively used on the principal Home and Foreign Railways, and for Marine Boilers by the Government and leading Steam-Facket Companies, are cheaper and more durable than the ordinary tubes.

Address **GEORGE RICHARDSON and CO.,**
New Broad-street, E.C. (277)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 10in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to **PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)**

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at
 one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and
 Mining purposes, with all necessary gearing for being driven by steam power.
 Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every
 purpose to which steam-power can be applied. When intended for winding,
 they are fitted with reversible link action and winding gear. They are
 easy of removal, as may be seen by the engraving, and can be set to work
 immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business,
 and are prepared to send off engines and machinery of the before-mentioned
 kinds in a few days from the date of order. They would also call attention to
 the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants,
 Shippers, and Colonial Agents.

(23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam
 Ploughing can also be used for any
 other operation the Farmer may wish.
 They are all made to move themselves
 by Steam from field to field, or place to
 place, requiring but one or two horses in
 the shafts to steer them. The Ploughs
 are so constructed as to be adjusted to
 any width of Furrow, and they can also
 be used as a Subsoiler, Trenching-Plough,
 and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

 tent Packing, also VULCANISED INDIA-RUBBER, in Sheets,
 Valves, &c., at the Offices,

35 CANNON-STREET, E.C.

(394)

BODMER'S PATENT SAFETY VALVE.

—In this Safety Valve
 the force which raises
 the cap (a) is derived
 from the steam pres-
 sure exerted upon a
 column of water, ad-
 mitted from the boiler
 through the pipe (b),
 and is therefore quite
 independent of the
 steam which is about
 to escape. The valve
 is consequently ex-
 ceedingly sensitive,
 and capable of open-
 ing to the full extent
 of its area, especially
 in the case of a sudden
 accumulation of steam
 from whatever cause.

For further informa-
 tion apply to Messrs.

R. & L. R. BODMER,
2 Thavies' Inn, Holborn, or to Mr. WM. ROUTLEDGE, New
Bridge Foundry, Salford, Manchester. (410)

REMARKS.—There is a greater disposition to business, but the amount of transactions continues limited. The Copper houses have advanced: English Copper, 4d. per lb. on manufactured, and 4 1/2 lbs. per ton on cake and tile; and the Tin houses have made an advance of 43 per ton on English Tin. Lead is about 10s. per ton higher.

LAWRIE AND HAGGER, Metal Brokers
33 Lombard-street, E.C.

LIST OF MISCELLANEOUS TENDERS IN VITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

STEAM ENGINE, Birmingham.—For a thirty-horse black condensing steam engine of guaranteed good construction, to be erected and finished within three months from the present date. Address, 309 Daily Post Office, Birmingham.

RAILWAY, Scotland.—For the works on the remaining portion of the main line of the Port Patrick Railway from near Stranraer to Portpatrick, together with the Portpatrick Harbour Branch. The rails will be supplied by the company. The assistant engineer will attend at the King's Arms, Stranraer, at 10 a.m., Dec. 8, to accompany intending officers over the works, and he will remain at Stranraer on the 9th further to exhibit the drawings and specifications, to be seen at the Messrs. B. and E. Blyth, 133 George-street, Edinburgh, and duplicate schedules obtained for 40s. Forms of tender from the engineers, or the secretary (Mr. A. Ingram, Stranraer), to whom tenders, Dec. 19.

LIGHTHOUSE WORK, Ireland.—For additional rooms over the dwelling adjoining the tower of the Tuscar Rock Lighthouse, conformably to the plans, sections, and specifications to be seen from 11 to 3 daily at the Ballast Office, Dublin, or at the office of Capt. E. Roach, Wexford, where also printed forms of tender. Tenders to Mr. W. Lees, secretary to Port of Dublin Corporation, Dec. 15.

LIGHTHOUSE LANTERN, Trinity Board.—A lantern for the Smalls Lighthouse. Plans, specifications, forms, conditions, Trinity House, where tenders by 10 a.m., Dec. 6.

LYCHGATE, BOUNDARY WALLS, &c., Woodstock.—1st, for erecting a lych gate and the boundary walls of the ground; 2nd, furnishing and erecting iron palisades and sliding gates; 3rd, laying out the ground, making and completing the roads. Plans, &c., office of Mr. Hawkins, Woodstock, Oxon. Tenders to Dec. 5.

BRIDGE, Llandoff.—For the erection of a small bridge and boundary walls to enclose some new ground adjoining the Cathedral yard, also for planting, draining, and forming roads therein. Drawings, office of Messrs. Prichard and Sendon, diocesan architects, Llandoff. Tenders, Dec. 16.

SEWERS, Kingston-upon-Hull.—For the cleansing and repair of the public sewers within the above borough for a period of one or three years from January 7th, 1860. Specifications of Mr. K. A. Marillier, surveyor, 73 Lowgate, Hull, until Nov. 30. Tenders to Dec. 9.

ROAD, Penkhill and Hartshill.—For making a new road with the fences thereto leading from Penkhill to Hartshill through the Mount Estate. Plans, &c., office of Mr. Lynham, surveyor, &c., Stoke-upon-Trent. Tenders, Messrs. Bishop and Blackiston, solicitors, Shelton, Dec. 12.

CANT-STEEL FILES, AND RASPS, AND STEEL, India Office.—For the supply of cant-steel files and rasps, and steel. Conditions of the contracts (two in number) at the Secretariat Office. Tenders before 11 o'clock, Dec. 6.

RAILWAY STORES, Lancashire and Yorkshire.—For the supply of the company's requirements in the ensuing half-year, to include coal (engine and furnace), coke and coal (smithy), copper and block tin, files and steel,

iron (bar and plate), nails, and tubes iron for locomotive engines. Further particulars and forms, Mr. R. J. Budge, the company's storekeeper, at the offices, Miles Platting, on and after Dec. 14. Tenders with the Secretary, Manchester, at 10 a.m., Dec. 28. Separate forms for each contract.

COALS, Navy.—For supplying and delivering into Her Majesty's Victualling Stores at Deptford 700 tons of South Wales coals, to be delivered one-half January 31, and the remainder by the 29th Feb., 1860. Forms of tender at the office of the Comptroller for Victualling, Somerset House; of the officer conducting the Packet Service, Liverpool; or of the Collector of Customs, Bristol. Not tender will be received after half-past one, Dec. 8; to be addressed to Secretary of Admiralty. Personal attendance unnecessary.

COALS, Navy.—300 tons of South Wales for Gosport. Forms Somerset House, Gosport, Liverpool, and Bristol. The coals to be delivered by the 31st of March, 1860. Attention, as in the foregoing case, called to the recent modification of the conditions. Tenders by half-past one, Dec. 8.

ROAD MATERIALS, London.—For the supply of the materials for the roads north of the Thames. Particulars at the office of the commissioners, 22 Whitehall-place, to which place tenders, Dec. 20.

VALUATION, Aitricham.—For new valuation and book of reference of all property in the township of Aitricham for the purposes of the Poor-rate assessment; also a plan of the township on an enlarged scale of double the size of the recent survey made for the Board of Health. Tenders, Dec. 8th, endorsed Aitricham Township Surveyor, 14 High-street.

IRONWORKS MANAGER.—One thoroughly experienced and conversant with the manufacture of iron in all its departments, including heavy forging and uses; he must be accustomed to the keeping of cast, yield, and stock accounts. H., 119 Guardian office, Manchester.

GAS MANAGER.—To undertake the management of the Eastbourne Gasworks, supplying all labour necessary for the manufacture and distribution of gas, the lighting of the public lamps, the laying-down of new mains, and the laying-on of new services, &c. Further particulars, Mr. J. H. Campion Coles, Secretary, Eastbourne; to whom applications, with terms and testimonials, Dec. 10.

BRASS TUBE MILL MANAGER.—To superintend a brass tube mill. Must be experienced in making both solid, drawn, and braised brass and copper tubes, and thoroughly understand the nature of metals. Address, H. 3 Journal office, Birmingham.

TWO HUNDRED TO THREE HUNDRED NAVIES on the South Durham and Lancashire Union Railway. Accommodation on the works, liberal wages. Apply at the contractor's offices, Kirby Stephen, Westmoreland.

TO ADVERTISERS.

All Advertisements occupying less than half-a-column are charged at the rate of 5d. per line for any number of insertions less than 13; for 13 insertions, 4d. per line; and for 53 insertions, 3d. per line.

Each line consists of 10 words, the first line counting as two. Wood-cuts are charged at the same rate as type for the space occupied.

Special Arrangements for larger or Serial Advertisements To ensure insertion, Advertisements must reach the Office by 5 o'clock on Thursday evening each week. None can be received after that time for the ensuing number.

BOURDON'S PRESSURE and VACUUM GAUGES.

These instruments may be obtained from JOHN DEWAR & Co. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—Manchester—ALLEN, HARRISON, & Co., Cambridge-street; BOUTLEDGE, New Bridge-street, Salford.

Glasgow—ALEXANDER MITCHELL, 330 Parliamentary-road. Belfast—GEO. H. STRYKE, York-street Foundry. Birmingham—ADAM DIXON, 48 Newhall-hill. Newport, Mon.—H. POOLEY & SON.

Newcastle-on-Tyne—GEORGE HABLE, Dean-street. (395)

THE IMPERIAL IRON TUBE COMPANY.

(SUCCESSORS TO GEORGE B. LLOYD AND CO.), Gas-street and Berkley-street, Birmingham. Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (347)

FUEL AND STEAM ECONOMY.

Apply to Mr. LEE STEVENS, C.E., 1 Fish-street-hill, E.C. (243)

EMIGRATION TO NEW YORK, CANADA, AUSTRALIA, NEW ZEALAND, EAST INDIES, CAPE OF GOOD HOPE, &c.

All Classes of Passengers booked throughout in the Finest Steam and Sailing Packets. Full Particulars in our circulars for 1859, may be had gratis on application to F. S. GRAY and Co., 54 King William Street, City, and 6 Tower Hill, London; and at 35 Bath Street, Liverpool. (187)

TO WIRE ROPE MAKERS.—ARCHIBALD SMITH

is now prepared to GRANT LICENCES for the use of his PATENT ROPE MACHINERY, guaranteed to work at six times the speed of any other, and to save upwards of fifty per cent. in the cost of making. It is used by the most eminent makers, and was also in the manufacture of the Atlantic Cable.—Apply to 69 Princess-street, Leicester-square, W. (193)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (309)

GLENFIELD PATENT STARCH,

USED IN THE ROYAL LAUNDRY, AND PRONOUNCED BY HER MAJESTY'S LAUNDRESSES TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR GLENFIELD PATENT STARCH,

SEE THAT YOU GET IT,

as inferior kinds are often substituted. Sold by all Chandlers, Grocers, &c., &c. (75)

ARTESIAN WELLS, BORING TOOLS,

PUMPS, &c. Engineers, Architects, Surveyors, Builders or others requiring a good supply of Water may have any quantity procured by W. SPILLER, 14 York-street Blackfriars-road, London, where may be had any quantity of Tools for Sinking or Boring, from 2 to 20 inches diameter, and from 100 to 2,000 feet depth; also Man and Tools to bore for Railroads, Minerals, &c., in any part of the world. Boring Tools and suitable Pipes for exportation, with full instructions for their use.

Builders, Contractors, Brickmakers, Barge and Ship Builders, and others, can be supplied with Wrought or Cast Iron Pumps, Double or Single, for excavation of Deep Wells, from 3 to 14 inches in the bore, and from 6 to 130 feet in length, to work by hand or Steam Power.

Hot-Water Apparatus for Conservatories, &c., on the most economical and improved principles.

Also Manufactory for Captain John Grant's much improved Cooking Apparatus. (44)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited) 15 Wellington-street North, Strand, London, W.C. (270)

LUND'S LONDON LEVER

FOR Drawing Corks is the most simple and efficacious Instrument ever offered to the public for removing the Corks from Bottles without disturbing the contents. The use of this Lever prevents the possibility of any injury to the hand by the accidental breaking of the neck of the Bottle.

Sold by all Cutlers and Ironmongers, and at the Patentee's Wholesale Warehouse, 23, 24, 25 Fleet Street, London. (178)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

CAUTION. TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine SMITH'S PATENT DOOR SPRINGS, for Swing Doors, are stamped with Name and Address, thus—SMITH, Patentee, 69 Princess-street, Leicester-square, London; and that Springs thus marked are warranted. SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application. (188)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board; the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S. E.

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS, Particularly invite attention to their **PATENT ARGAND LAMP OIL**, for Railway Roof and Signal Lamps; also to their **EXTRA-REFINED ENGINE OIL**, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (28)

J. W. CLARE, C.E., Inventor of the Patent Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the *cheapest* coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (311)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. **SPENCER, READ, & Co.**, 4 Agar-street, Strand, W.C. (90)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

COLD and TEETH.—Messrs. BROWNE and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

AGENTS FOR ALL THE LEADING IMPLEMENT MANUFACTURERS.

WILLIAM DRAY and COMPANY, Agricultural and General Engineers, &c., Adelaide Place, London Bridge, invite attention to their new Central Premises, close to London Bridge, where may be seen their celebrated Champion Reaper, Chaff Engines, Oat Breakers, Post Mills, Pumps, Weighing Machines, Corn Bins, their Patent Self-Adjusting Reel, Garden Engines, Hand-some Garden Seats, Lawn Mowers (every make), Flower Stands, and Garden Tools of all descriptions. Note.—Descriptive Catalogues of any particular class of Implements forwarded post free upon application. (318)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine **POWDERED PURE FLOUR PLUMBAGO**, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY, Battersea Works, London, S.W. (334)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and **BUILDERS' SALESMEN**, having opened Registers for Public and Private Sales of all kinds of **JOB LOTS**, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the **BUILDING TRADES REGISTRY OFFICES**, (established 1857) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on **EVERY TUESDAY**, at ONE O'CLOCK, and for the present at the **BUILDERS' SALE GROUNDS**, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential. (204)

LITHOGRAPHY AND WOOD ENGRAVING.

G. T. IZOD, Draughtsmen and Engravers on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated. Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. **G. T. Izod and Co.**, Tudor-street, New Bridge-street, opposite the City Gas Works, London. (365)

ESTABLISHED 50 YEARS.—I. ASTON'S BOX AND IVORY RULE MANUFACTORY, No. 25 Old Compton-street, Soho. Surveyors' and Architects' Drawing Scales, T-Squares, Angles, Curves, Parallel Rules, Marquois Scales, Horse Measures, Standards for measuring Soldiers, Measuring Tapes, and every description of English and Foreign Rules and Scales made to order. All sorts of Rules repaired. Wholesale and Retail. (390)

EMBARRASSED AFFAIRS—DISPUTED OR NEGLECTED ACCOUNTS.

In all such cases, the best Advice and Assistance, whether Legal or otherwise, may be obtained from

MR. WILLIAM FISHER,

Accountant, Arbitrator, and Legal Agent, 2 Portsmouth-street, Lincoln's Inn Fields. (319)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.

LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Wagon Wheels.

STEEL-IRON for Springs. MERCHANT and other Irons manufactured. **WM. F. HOYLE**, Proprietor. (278)

ESTABLISHED 1700.

WINDOW BLINDS.—**GEO. F. JAMES, and CO.**, Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury Place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with dispatch. Experienced Workmen sent to any part of the kingdom. (381)

EDWIN JEWITT, ENGRAVER ON WOOD AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (84)

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL,

104 ST. JAMES'S PLACE, LAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

ISCA FOUNDRY COMPANY, OLD BARRACKS, NEWPORT, MON. ENGINEERS, AND RAILWAY WAGON BUILDERS. Manufacturers of Switches, Points, and Crossings, Chairs, Spikes, Bolts, and General Railway Fittings. (270)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of **RAILWAY PLANT and STORES**. 13 DOCK-STREET, DUNDEE. (280)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious **VINEGAR**, insure purity and effect a saving of 50 per cent. See a Report of Dr. Lethely, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others. Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

SMALL GAS APPARATUS, WITH FREEDOM FROM NOISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Stations, And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers, **J. T. B. PORTER and CO., Lincoln.** (340)

INDIA-RUBBER VALVES FOR STEAM ENGINES, PUMP PACKING, &c.—Explanatory Drawings and Information as to the best modes of fitting and arranging the above, and all other Mechanical Applications of **VULCANISED INDIA-RUBBER**, are furnished post-free by

CHARLES MACINTOSH & Co., Patentees, Cambridge-st., Manchester, and 3 Cannon-st. West, London. MANUFACTORY and DEPOT, Cambridge-st., Manchester. GENERAL WAREHOUSE, 3 Cannon-street West, London, E.C.—C. M. and Co.'s only Establishments. (139)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the **PATENT FERRUGINOUS CEMENT PACKING**, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO., India-rubber Manufacturers, 9 Gresham-street West, E.C. MILL—Tottenham, N. (360)

CONDY'S PATENT FLUID or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and is DESTROYER FOR EVER the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp (238)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

BESSEMER STEEL.—The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the *Engineer* of the 24th of June last.

**THE LONDON
WARMING AND VENTILATING COMPANY,
(LIMITED),**
26 GREAT GEORGE STREET, Westminster, S.W.
(MANAGER—MR. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(12)

**W. BLACKETT.
HOPE IRON WORKS.
SOUTHWARK BRIDGE ROAD.
LONDON.**

W. BLACKETT has in Stock a variety of Vertical and Horizontal Steam Engines, Boilers, and Engineers' Tools, ready for delivery on the shortest notice. Apply as above. (70)

VENETIAN HOUSE,  ESTABLISHED 1826.

JOSEPH AGACE,

33 UNION-STREET, BOROUGH, S.E.,

WINDOW BLIND MANUFACTURER,

Wholesale and Retail, and for Exportation,

ON THE MOST REASONABLE TERMS.

Engravings, with Price Lists, forwarded on application, post-free.

RANSOMES AND SIMS,
IPSWICH,
AGRICULTURAL & GENERAL ENGINEERS
AND
IRONFOUNDERS.
LONDON OFFICE: 31 Essex STREET, STRAND, W.C.
(165)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentists. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

**IMPORTANT TO MANUFACTURERS,
MILL OWNERS, &c.**

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalis, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From **TRUMAN, HANBURY, BUXTON, & Co.,** Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the failing of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From **JAMES ABERNETHY & Co.,** Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using *cross bands* that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

**POISONED WATER PREVENTABLE
BY THE USE OF GUTTA PERCHA TUBING.**

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of *leaden pipes* for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Gravanic Batteries, &c., &c.

MANUFACTURED BY THE
Gutta Percha Company, Patenters,
18 WHARF ROAD, CITY ROAD, LONDON,

AND SOLD BY THEIR
WHOLESALE DEALERS IN TOWN AND COUNTRY.

GENERAL PATENT COMPANY (Limited).

CHIEF OFFICE, 71 FLEET-STREET, E.C., LONDON.
This Company undertakes every description of business in connection with Patents, Inventions, and Designs, at the most moderate charges.—Capital advanced, and every assistance given in protecting, introducing, and disposing of inventions.—Agencies in every part of the United Kingdom and abroad. Printed information (gratis) on application to—

ROBERT M. LATHAM, Secretary.
Influential applications for agencies from unrepresented districts will be entertained, and liberal terms accorded.

BRICK AND TILE MACHINES, &c., &c. CLAYTON'S PATENTS.

ATLAS WORKS, LONDON.
During the S. C. Cartle Show, December 8th to 9th, HENRY CLAYTON & Co., at Stands Nos. 630 to 636, will exhibit their Hand-power Patent Brick-making Machinery, Harvesting Machinery, Drainage Implements, &c., &c.

As the space at the Show does not admit of the exhibition of their larger Machines, H. C. & Co. solicit the personal inspection by all parties interested in this class of machinery of their recent improvements, and of the several sizes of the machines on view (some in operation) at their manufactory, during the show days, from 11 a.m. to 3 p.m. Five minutes walk from the Show.

ATLAS WORKS,
Upper Park-place, Dorset-square. (411)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

GALVANIZED and CORRUGATED IRON

and every description of Galvanized Iron Goods.
W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.
All kinds of Iron-work Galvanized. (375)

FOR DRIVING MACHINERY, MILLS, &c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

JAMES LYNE HANCOCK,

Vulcanised India-Rubber Works, Goswell-jewes, and 8 Goswell-road, London. (24)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

REQUIRED, in a London Engineering Office, **ACHIEF DRAUGHTSMAN.** Applications showing that scientific knowledge, as well as thorough practical experience of Engines, Mills, and Machinery, is possessed, will be attended to. Address, with full particulars, and state present or last employ, omitting names and under initials in the first instance, if preferred, to X. Y. Z., care of Messrs. BROWN and STANDFAST, Newspaper Agents, 4 Little George-street, Westminster, London, S.W. (418)

A HIGH PRESSURE ENGINE AND BOILER of Six-horse power, for Sale. May be seen at work; together with Forty-five feet of Wrought Iron Turned Shafting; Drums, Pulleys, &c. Particulars, prices, &c. on application at the Kent Iron Works, Bridge-street, Greenwich. (413)

ENGINEERS' MACHINES AND TOOLS FOR SALE.
A PLANING MACHINE to plane six feet by thirty inches. Two Boring and Drilling Machines with drills and rosebits. A Bolt Screwing and a Nut Shaping Machine. Single and double-acting Machines to Punch and Shear Plate-iron from a quarter of an inch up to one inch thick, portable and for fixing. A Boiler-plate Heating Furnace of Cast and Wrought Iron. Anvils. Parallel Vices. Haley's Screw Jacks. Gas-tube Screwing Tackle. Blocks and Pulleys, &c.
Engravings, Particulars, and Prices on application at Kent Iron Works, Bridge-street, Greenwich. (414)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.
WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarm when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

METROPOLITAN BOARD OF WORKS.—MAIN DRAINAGE OF METROPOLIS.—SOUTHERN OUTFALL TUNNEL SEWER.—To BUILDERS and CONTRACTORS experienced in Tunnel Works.—The Metropolitan Board of Works hereby give notice, that they will MEET in the Council Chamber, Guildhall, in the City of London, on Friday, the 8th day of January, 1860, at Twelve o'clock at Noon, precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a MAIN BRICK SEWER, 7 miles 2,240 feet in length, or thereabouts (5,000 feet of this length being in tunnel), and for the execution of other works in connection therewith; such sewer to extend from a point in Erith Marshes, opposite Dagenham Reach, in the county of Kent, to Woolwich, and through and under Woolwich to Norman's-road, otherwise North Pole-lane, Greenwich, in the same county.

Parties desirous of submitting tenders may, upon payment of £3, obtain plans, sections, specification, form of tender, and other particulars on application to J. W. Bazalgette, Engineer of the Board, at the office of the Board, between the hours of Nine a.m. and Four p.m. Tenders, addressed to the Metropolitan Board of Works, must be delivered at the office of the Board, No. 1 Greek-street, Soho, before Four o'clock p.m. on Thursday, the 5th day of January, 1860, and no tender will be received after that hour.

The Board do not bind themselves to accept the lowest or any tender, and the party whose tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.
No. 1 Greek-street, Soho, November 17, 1859. (408)

MACHINERY of all Kinds DRAWN and ENGRAVED on WOOD, with the greatest accuracy of detail and Artistic Effect, by

J. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. (343)

FOR CORRECT FAMILY ARMS, CREST, or PEDIGREE, send name and county and 7s. 6d. to J. LOCK'S, City Heraldic Office, No. 2, Old Jewry, E.C., London, and in a few days you will receive a neat drawing of your Arms, &c., in Heraldic Colours, to be engraved on Seal, Ring, or Family Plate. On y parle Français, Italien, Allemand, et Hollandaïs.

The BEST are ALWAYS the CHEAPEST. Name-plate and 50 Enamel Cards beautifully Engraved for 2s. 6d., post free 2s. 7d. Write to J. Lock, City Heraldic Office, No. 2, Old Jewry, E.C. Enclose stamps and you will receive Copper-plate Cards within three days.

ENVELOPES with DIES.—Your Name and Address elegantly Embossed in Colours, or your Crest tastefully stamped, 2,000 for 18s.; good paper and best workmanship. Send post-office order to JOSEPH LOCK, City Heraldic Office, No. 2, Old Jewry, E.C., two doors from Cheap-side.—No charge for the Die. (332)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS,
Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (28)

J. W. CLARE, C.E., Inventor of the Patent Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded. SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (284)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

COALS.—The Three Pits Coal, nearly equal to the best Wall's-end, delivered free, 19s. per ton, may be ordered of the keepers of most of the branch Post-offices; or, by letter, of PLIMSOIL & MOTHERSILL, Coal Department, Great Northern Railway Station, King's-cross, N. (306)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (355)

ESTABLISHED 50 YEARS.—I. ASTON'S BOX AND IVORY RULE MANUFACTORY, No. 25 Old Compton-street, Soho. Surveyors' and Architects' Drawing Scales, T-Squares, Angles, Curves, Parallel Rules, Marquois Scales, Horse Measures, Standards for measuring Soldiers, Measuring Tapes, and every description of English and Foreign Rules and scales made to order. All sorts of Rules repaired. Wholesale and Retail. (360)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam. The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Searriller Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it. The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place. These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes. Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER Farmer, Hatfield, Herts. (315)

THE RAILWAY CARRIAGE COMPANY,
OLDBURY, NEAR BIRMINGHAM.
LONDON OFFICE--34 GREAT GEORGE STREET, WESTMINSTER,
Manufacturers of every Description.

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE. (273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED. (59)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.
Mills--Tottenham, N. (360)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity. For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 25 lbs. forwarded on receipt of 8s. Packages free.

Address--

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S.W. (334)

New Broad-street, E.C. (377)

BESSEMER STEEL--The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 24th of June last. (363)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COOKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronized by the Lords of the Admiralty, Besides BOURDON's and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

THE simplest and most effective Ventilator in use, to be fixed in the external walls of buildings. Prices from 2s. each. Can be had of any Ironmonger, Builder, &c., in the kingdom.

Sole Manufacturer, R. RAMAGE, late Parks and Co., Manufacturers of Fair's Patent Plate Glass and Metal Ventilators. Metal Sashes, Skylights, Ramage's Improved Glass Ventilators, Rising Cap Ventilator dispensing with Balance Weight, &c.

Factory:—

55A HOLYWELL-ST., MILLBANK, S.W., LONDON. (348)

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield street, Borough-road, Southwark, S.E. (362)

CHUBB'S LOCKS, FIREPROOF SAFES, CASH AND DEED BOXES.

Complete Lists of sizes and prices may be had on application.

CHUBB AND SON,

57 St. Paul's Churchyard, LONDON; 28 Lord-street, Liverpool; 16 Market-place, Manchester and Wolverhampton. (4)

RICHARD BAIRD, GENERAL COMMISSION AGENT, and CONTRACTOR for all descriptions of RAILWAY PLANT and STORES. 13 DOCK-STREET, DUNDEE. (280)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

BOURDON'S PRESSURE and VACUUM GAUGES.—These instruments may be obtained from JOHN DWYER & Co. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—Manchester—ALEX. HARRISON, & Co., Cambridge-street; Rotherham—NEW BRIDGE-STREET, Salford; Glasgow—ALEXANDER MITCHELL, 350 Parliamentary-road; Belfast—GEO. H. STURGE, York-street Foundry; Birmingham—ADAM DIXON, 48 Newhall-hill; Newport, Mon.—H. POOLEY & SON. Newcastle-on-Tyne—GEORGE MARLE, Dean-street. (305)

CONDY'S PATENT FLUID or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.
Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.
This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.
The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, those places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.
Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.
Free to Railway on receipt of Order or Stamp. (1938)

GOLD AND TEETH.—Messrs. BROWNE and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to Stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY
having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffle, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 45

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL,
10½ ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels,
Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,
J. T. B. PORTER and CO., Lincoln. (346)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, Tracings, &c.
Address, M. E., 9 Parliament-street, Westminster. (304)

CRAWHALL AND CAMPBELL,

MACHINE AND TOOL MAKERS,

AND MILLWRIGHTS,

ELLIOT WORKS, FINNIESTON,
GLASGOW.

Manufacturers of Engineers' Tools of every description, Screwing Apparatus of standard gauge, Boring Grabs, &c. (303)

ENGINEERS' TOOLS FOR SALE.—A Superior SELF-ACTING SLIDE and SCREW-CUTTING LATHE, 7 in. centre and 7 ft. bed. A Ditto, 7 in. centre and 9 ft. bed. A PUNCHING and SHEARING MACHINE, for 4 in. plates. Two Ditto for 3 in. plates, and Two Ditto for 2 in. plates. VERTICAL DRILLING MACHINE; MILLAR and BENCH DRILLS; HALEY'S and other LIFTING JACKS; RATCHET BRACES, &c.
Apply to PAGE and CAMERON, 64 Old Broad-st., E.C., London. (285)

RANSOMES' PATENTED PROCESS FOR PRESERVING STONE, CEMENT, STUCCO, &c.—By this process the softest and most friable Stone, Cement, or Stucco, can be rendered Impervious and Imperishable, DECAY AT ONCE ARRESTED AND PREVENTED.
For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers. (170)

EDWIN JEWITT, ENGRAVER ON WOOD AND DRAFTSMAN, 1 Pickett-place, Strand, near Temple-bar. Engineering, Scientific, and Mechanical Designs accurately engraved. Manufacturers and Tradesmen's Catalogues Illustrated. W.C. (84)

YORKSHIRE TYRE & AXLE WORKS, ROTHERHAM.
LOCOMOTIVE TYRE-BARS of every description for Engines, Carriages, and Railway Waggon Wheels.
STEEL-IRON for Springs. MERCHANT and other Irons manufactured. WM. F. HOYLE, Proprietor. (278)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JAMES, and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury Place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with dispatch. Experienced Workmen sent to any part of the kingdom. (381)

WATER GAUGES—WATER GAUGES.—Sir,—We find your German Gauge Tube superior to any other, and strongly recommend it. We were compelled to abandon the use of our water gauge until applying your glass tube.

Wilcox and Co., Millwall Pottery Company.
These Tubes are superior to all others; being a clear white, no mistake can arise in working. Guaranteed to stand a pressure of 500 lb.
Extensively used on all the principal lines.
To be had only of E. MOORE, 55 Upper Marylebone-street, W.; and 72 Great Titchfield-street, W.
•• Price List of Gauge Fittings, &c., on application. (94)

ISCA FOUNDRY COMPANY, OLD BARRACKS, NEWPORT, MON.
ENGINEERS, AND RAILWAY WAGON BUILDERS.
Manufacturers of Switches, Points, and Crossings, Chairs, Spikes, Bolts, and General Railway Fittings. (379)

ESTABLISHED 1700.
WINDOW BLINDS.—GEO. F. JAMES, and CO., Wholesale, Retail, and Export Window Blind Manufacturers, 29 Finsbury-place, and 9, 10, and 11 Cross-street, Finsbury. Estimates given and executed with dispatch. Experienced Workmen sent to any part of the kingdom. (355)

CLAYTON, SHUTTLEWORTH, AND CO.,
OF LINCOLN,
78 LOMBARD STREET, LONDON, E.C.,
AND 36 DALE STREET, LIVERPOOL,
AGRICULTURAL AND GENERAL ENGINEERS,
And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents. (23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C. (388)

TRACTION ENGINES,
(BOYDELL'S PATENT,)

MANUFACTURED BY CHARLES BURRELL,

ST. NICHOLAS WORKS, THETFORD, NORFOLK,

And ordered for India, Australia, and South America, may now be seen, complete and in course of construction at the above works. BOYDELL'S TRACTION ENGINES AND ENDLESS RAILWAY will draw heavier loads over good roads than any other traction engine, and on soft and bad roads will draw heavy loads where no other traction engine can move itself. All objection to the wear and tear of these Engines is entirely removed by the use of Charles Burrell's improved patent Wrought Iron Wheels, fitted with Rails and Tyre, as well as all the wearing parts, of Steel.

47 Apply also to Mr. Hemming, Mark Lane, E.C. (40.)

VENETIAN HOUSE,  ESTABLISHED 1826.

JOSEPH AGACE,

33 UNION-STREET, BOROUGH, S.E.,

WINDOW BLIND MANUFACTURER,

Wholesale and Retail, and for Exportation,

ON THE MOST REASONABLE TERMS.

Engravings, with Price Lists, forwarded on application, post-free. (593)

CLOTHING,
13, CANNON-ST., LONDON BRIDGE. (343)

PATENT STEAM PACKING, &c., &c.—
TUCK'S PATENT ELASTIC PACKING AND
PATENT METALLIC LIN-
INGS for STEAM ENGINES,
PUMPS, &c.

ADVANTAGES.—A more perfect vacuum is obtained. Friction reduced, great saving in oil and tallow, and the Packing is gradually and completely worn away without becoming hard, THUS OBVIATING THE NECESSITY OF DRAWING THE OLD PACKING.

Orders received for the Patent Packing, also VULCANISED INDIA-RUBBER, in Sheets, Valves, &c., at the Offices,

35 CANNON-STREET, E.C. (304)

BODMER'S PATENT SAFETY VALVE

—In this Safety Valve the force which raises the cap (a) is derived from the steam pressure exerted upon a column of water, admitted from the boiler through the pipe (b), and is therefore quite independent of the steam which is about to escape. The valve is consequently exceedingly sensitive, and capable of opening to the full extent of its area, especially in the case of a sudden accumulation of steam from whatever cause.

For further information apply to Messrs. R. & L. BODMER, 2 Thavies' Inn, Holborn, or to Mr. WM. ROUTLEDGE, New Bridge Foundry, Salford, Manchester. (410)

DOOR **DRAUGHTS of COLD AIR** and DUST round Room, Office, or outside Doors and Windows **EFFECTUALLY PREVENTED** by GREENWOOD'S PATENT INDIA-RUBBER STOPS, the most simple and effectual method of making air-tight joints to Joiners' or cabinet work, old or new. These Stops can be had any length or pattern. Self-acting Spring Stops, for the bottoms of doors.

The Trade supplied.

JOHN GREENWOOD, Patentee, 10 Arthur-street West, London-bridge. (354)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S
LONDON RACK CORK
SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlery and Ironmongers'. (354)

IMPROVED LIQUID MANURE OR GENERAL PORTABLE PUMP.

These Pumps are fitted with J. Warner and Sons' Patent Bucket and Valve, and cannot clog in action. The Barrel is made of Galvanized Iron, not likely to corrode, and can be raised or lowered at pleasure on the stand, the legs of which fold together, and it may be carried with ease by one man to tank or pond.

WARNER'S SWING WATER-BARROW.
(Holding about 35 Gallons), £3 2s.

is intended for all large Establishments where much watering is done by the watering-pot. By its use the Gardener will save much time and labour, particularly where the Tank, Pond, or Pump is at a distance from the garden.

MUSICAL SHEEP BELLS, with Straps, in sets of 6, 19s.; ditto, in sets of 8, 25s.; ditto, in sets of 12, 38s.

BRASS SPRING, from 9s. to 18s.
CONSERVATORY PUMP, No. 567, with Warner's Registered Spreader, 27s. 6d.

Galvanized Iron Tub GARDEN ENGINE, with Warner's Registered Spreader, is strongly recommended for durability and low price, viz., £2 15s., to hold Ten Gallons. Larger sizes, in either wood or iron.

WARNER'S CATTLE and SHEEP BELLS, in sets of 6, with Straps, 13s. per set.

Bells for Churches, Chapels, Colleges, Schools, Turret Clocks, &c., cast for any size, note, or weight, singly or in peals. Tuned by machinery. Stocked and wheeled ready for fixing. Old Bells re-cast or taken in exchange.
The great 16-ton Bell, for the Houses of Parliament, was made by JOHN WARNER and SONS, 1856, under their Patent.

The above may be obtained of any Ironmonger or Plumber, in town and Country or of the Patentees and Manufacturers.

(30)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor*.

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient.

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works,
108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected.

Every Variety of Gutta Percha Article.

THORLEY'S FOOD FOR CATTLE.

IN acknowledging the increasing demand for THORLEY'S Food for Cattle, Mr. THORLEY in the warmest terms begs leave to thank his customers for their kind patronage, and to assure them that every endeavour on his part will be exercised to merit a continuation of their favours. The experimental evidence which is daily being received, showing the efficacy and economy of this now justly celebrated Cattle Food Condiment, is very congratulating and encouraging, especially as it is voluntarily given along with orders for fresh supplies; for practical testimony thus given must always be received as satisfactory evidence in favour of the article—a justification, as it were, for continuing its use. The experience thus being acquired is fast establishing the condimental value of THORLEY'S Food for Cattle in every town and province of the kingdom; and the more that breeders and feeders of live stock examine the subject practically, the more thoroughly are its merits appreciated by them.

"Practice with Science" is the golden motto of the Royal Agricultural Society of England, and this is just the kind of testimony now being received in favour of THORLEY'S Food for Cattle; for agriculturists and other owners of stock are, by the successful use of this condiment, beginning to experience that the value of food depends upon how it is

digested. Chemically, its constituent elements may be of the highest value; but if imperfectly digested, what is its value to the animal which eats it? The testimony just referred to proves that hay and straw properly seasoned with this condiment is more nourishing than unseasoned food, although the latter may contain a much greater amount of alimentary matter; consequently the practical question arises, how many animals, including horses, oxen, sheep, pigs, poultry, and dogs, are there, whose food is imperfectly digested, because unseasoned? whose digestive and other functions are deranged by such unwholesome food—functions which might soon be restored to a healthy state by properly seasoned food? This is the grand problem, the practical solution of which is giving rise to an increased consumption of THORLEY'S Food for Cattle; and Mr. THORLEY has much pleasure in inviting special attention to it, hoping that practical men will solve this important question practically, by giving his condiment a fair trial.

Mr. THORLEY also begs leave to draw attention to the harmony which exists amongst the different examples above referred to, each corroborating the other, thus proving the soundness of his practice of seasoning the food of cattle.

Mr. JAMES BRENNER, Steward to H.R.H. the Prince Consort, states: "Through using it on my saddle-horse I have been enabled to reduce his ordinary food half a truss of hay and half a bushel of oats per week, and can testify that he has gained very much in condition."

Mr. JAMES FISHER, Farm Manager to her Grace the Duchess of Athole, says: "I have found your Food for Cattle to answer very well."

Sir DAVID CUNYNGHAME, Bart., writes: "The cows thrive and do well upon it, and the pigs have improved already wonderfully."

Sir JOHN RISTON, Bart. expresses his approbation thus: "Relating to Thorley's Food for Cattle, I have fed with it for the last four months, and never fed with more nourishing food for cattle in general."

Sir JOHN ANDREW CATHCART, Bart., states: "I have used Thorley's Food for Cattle for three months, both for horses and cattle, and find that it has an extraordinary effect in producing condition and keeping them in a healthy state."

Sir JOHN HESKETH LETHBRIDGE, Bart., writes: "My old groom on speaking to him this morning says my horses never did better, since they have been fed upon it."

And since his Almanack for 1860 was in print, Mr. THORLEY has received a note from Ormsby, in which Sir EDMUND LACON draws attention to the fact that Thorley's Food for Cattle was of great service to a pony which was very difficult to get into condition.

Again, Colonel WHITE says: "I have tried your Food with horses and pigs; in both cases I consider they have considerably improved in condition."

Colonel RAMSAY writes: "I have used Thorley's Food both for horses, cattle, and swine, in all instances with great success, and can safely recommend the use of it both for economy and fattening qualities."

Lieut.-Col. MACDONALD states, in 1857: "I would be unjust if I withheld my testimony to its beneficial effects, which are most apparent in the improved condition of the horses." And in 1859: "As an instance of its efficacy I may mention that having had occasion during the autumn (1858) to hire a horse for three months, his owner said to my servant when he was returned, 'He is so much improved that I would not have known him.'"

GODFREY MEYNELL, Esq., in writing from Langley, says: "I shall be glad if you will forward to me at the above

address another cask of your Cattle Food, with measure, as a tenant of mine is anxious to make a trial of it. From what I have seen of its effect upon two milch cows of my own that slipped their calves some time since, I am inclined to speak favourably of your Food."

Captain the Hon. HUGH GOSCH writes: "I have tried Thorley's Food for Cattle, and gave two feeds per day to an aged horse, which I found it impossible to get in condition otherwise, and in six weeks he became very fat, and entirely beyond anything I could conceive."

ALEXANDER HENDERSON, Esq., the younger, of Stemster, Caithness, says: "I have used Thorley's Food with great advantage, in one case where a half-bred mare would not feed."

"COURTENAY VERNON, Esq., would feel obliged to Mr. Thorley if, on the 15th of November, he would forward him three casks, to be continued monthly from that date until further notice, Mr. Vernon having found the Food so useful and beneficial for all kinds of stock."

Captain LOCKYER, R.N., adds: "I have found it most excellent and economical."

W. WINTERTON, Esq., says: "The heifer that I gave some of your Food to has taken three prizes."

J. M. BROWN, Esq., concludes thus: "I beg to inform you that I have three hunters now in better condition than I ever had in any previous season at this time, which I attribute to your Food."

S. H. WATSON, Esq., states that: "By using it, I have been able to dispense with all horse medicines and clipping, my horses being now beautifully coated."

EDWARD M'GOWAN, Esq., says: "It gives to horses and pigs a bright fresh skin, and a much improved appearance; working horses it keeps in excellent condition and fresh; in feeding bullocks it is manifestly of great utility, developing fat in much less time than in feeding on turnip and cake alone."

WILLIAM PATRICKSON, Esq., writes: "I find my horses thrive well on it, and like it much."

JOHN HODGE, Esq., states: "It strengthens and fattens better than anything which I have used hitherto."

CHARLES INGRAM, Esq., says: "I have used it for a considerable time, and especially for one of my horses, which is of such a nervous and irritable temperament that he used to get frequent attacks of spasmodic colic or fret; since I have given him this Food (three months), he has

never suffered from it. I believe, with Professor Apjohn, it operates by sharpening the appetite, and promotes healthy digestion and rapid assimilation, rendering it of great advantage to the owners of cattle; and I give Mr. Thorley great credit for having effected so desirable an object, and so great a boon to the public."

The Rev. C. R. ELLIS, Tobago, West Indies, says: "One horse particularly—a cribber—has improved much from its use; and from its effects upon him and others, I am convinced it has an admirable tonic in its composition, and is well adapted for improving the condition and appearance of all horses fed with it. I have ordered more to come in the next year's supplies, being satisfied as to its economy."

B. HAIGH ALLEN, Esq., has used it with his yearling calves, pigs, and horses; in all cases it has answered.

W. H. GOGARTY, Esq., says: "I have used Thorley's Food for Cattle, and find it very superior in keeping horses in good condition, and fattening all kinds of cattle."

R. CLOAK, Esq., says: "Before I had this food introduced to my notice I was allowing my horses half a bushel of Oats daily. I now reduce the Oats one gallon, and substitute one packet of the Food, and my horses are, most certainly, in better condition than previously. Not satisfied with this, I determined to give it to my pigs and poultry, and after several severe comparisons between those fed with it and otherwise, I am most decidedly of opinion that it is a most excellent food."

WM. LINDSEY, Esq., says: "I have used your Food for Cattle some two years upon horses, cows, and pigs, against other kinds of food, and find it to be far superior at a less cost. I think well to state that, during the time I gave it to pigs I had a poor dog who got so fat by eating out of the pigs' food, that he really astonished all who saw him. I have, at various times, discontinued the Food, and find that the dog is reduced to his former state. My fowls are equally as fond of the Food as the dog, and the result is the same."

J. NEWBERRY, Esq., says: "On one occasion, I gave it to a cow after it had been under a farrier for a length of time without any effect. I gave your Food, as per your instructions, and found the effect was astonishing. I also tried it upon a remarkably poor horse, after many other means had failed. I am satisfied he gained £10 in value in the course of six or eight weeks from the use of your food."

Sold in cases containing 448 packages, each package one feed, at the cost of 56s. per case; also in casks, containing 448 feeds, with measure included, price 50s. per cask. Carriage paid to any Railway Station in the United Kingdom. None are genuine without the signature being affixed to each package or feed—

CORT TESTIMONIAL FUND.

COMMITTEE.

WILLIAM FAIRBAIRN, Esq., Chairman.

Iris Mackie, Esq. (Mayor). Joseph Whitworth, Esq.
Thomas Bazley, Esq., M.P. Benjamin Hick, Esq.
James A. Turner, Esq., M.P. John Penn, Esq.
Richard Cobden, Esq., M.P. John Boyd, Esq.

Mr. DAVID MORRIS, Secretary, 1 Market Place,
Manchester.

At a Meeting of the Committee, held in the Town Hall,
Manchester, the Mayor in the Chair:—

Resolved.—That a Circular be prepared, and signed by
Mr. Fairbairn as Chairman of the Committee, appealing to
all interested in the subject of iron manufacture, for co-
operation and assistance to the Cort Fund, and that Mr.
D. Morris, Secretary, issue such Circular, accompanied by
blank forms for Subscriptions forthwith, so as to complete
the labours of the Committee as early as possible.

"That when the Subscription List is completed, the sum
raised shall be invested in the purchase of Annuities, or
some other form of securing the comfort of the declining
years of the survivors of the CORT FAMILY."

Considering the services rendered to the country by the
inventions of HENRY CORT, and the present destitute con-
dition of his Son and Two Daughters, all of them upwards
of 70 years of age, the Committee look forward with con-
fidence to all those interested in, or benefitted by, his inven-
tions to assist in its efforts towards raising a sum suffi-
cient for their future maintenance and support.

Subscriptions already received.

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.
WALKER'S PATENT FRICTIONLESS
FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simpli-
city; it also acts as an Alhram when the water falls low
in the boiler. For a description, with Engravings, see the
MECHANICS' MAGAZINE for October 28th. Testimonials
have been given as to their efficiency by many eminent
Engineers, and they are not expensive. For further par-
ticulars apply to the Patentee, whose works are at
No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson,
Civil and Mechanical Consulting Engineer, 9 Buckingham-
street, Strand, London, where they also may be seen.
(377)

PARTNERSHIP.—The ADVERTISER is
desirous of entering as Junior Partner in an Engi-
neering and Ship-building concern. He has several highly
useful Inventions applicable to Steam and Shipbuilding,
which he would Patent in the name of the firm. He is
capable of Designing and making Finished and Working
Drawings of Ships, Steam Engines, &c., and would devote
his whole time and attention to the business.

Address, T. M., MECHANICS' MAGAZINE Office, 168 Fleet-
street. (361)

GALVANIZED and CORRUGATED IRON

and every description of Galvanized Iron Goods.
W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.
All kinds of Iron-work Galvanized. (375)

**TO RAILWAY COMPANIES, CONTRACTORS,
AND OTHERS.**

GEORGE NEIGHBOUR and SONS,

OIL MERCHANTS.
Particularly invite attention to their PATENT ARGAND
LAMP OIL, for Railway Roof and Signal Lamps; also to
their EXTRA-REFINED ENGINE OIL, for Locomotive
and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Canoe
Street. (28)

WANTED, in an improving Firm on the
South Coast, a PRACTICAL FOREMAN, who
thoroughly understands Shipping, also General Smiths',
Turners', and Fitters' Work; to take the Superintendence
of about Twenty Workmen. He must also be competent
to take an Order and to give an Estimate.

The situation will be permanent, with a rising salary to
an efficient man.

Address, stating Terms and experience, to X. W.,
21 Cardington-street, London, N.W. (423)

METROPOLITAN BOARD OF WORKS.

MAIN DRAINAGE of METROPOLIS.—
SOUTHERN OUTFALL TUNNEL SEWER.—To
BUILDERS and CONTRACTORS experienced in Tunnel
Works.—The Metropolitan Board of Works hereby give
notice, that they will MEET in the Council Chamber,
Guildhall, in the City of London, on Friday, the 6th day of
January, 1860, at Twelve o'clock at Noon precisely, and
will then be prepared to open TENDERS by parties who
may be willing to CONTRACT for the CONSTRUCTION
of a MAIN BRICK SEWER, 7 miles 2,240 feet in length,
or thereabouts (5,000 feet of this length being in tunnel),
and for the execution of other works in connection there-
with; such sewer to extend from a point in Erith Marshes,
opposite Dagenham Breach, in the county of Kent, to
Woolwich, and through and under Woolwich to Norman's-
road, otherwise North Pole-lane, Greenwich, in the same
county.

Parties desirous of submitting tenders may, upon pay-
ment of £3, obtain plans, sections, specification, form of
tender, and other particulars on application to J. W.
Basalgette, Engineer of the Board, at the office of the
Board, between the hours of Nine a.m. and Four p.m.

Tenders, addressed to the Metropolitan Board of Works,
must be delivered at the office of the Board, No. 1 Greek-
street, Soho, before Four o'clock p.m. on Thursday, the
5th day of January, 1860, and no tender will be received
after that hour.

The Board do not bind themselves to accept the lowest
or any tender, and the party whose tender shall be ac-
cepted will be required to provide two approved sureties
for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.

No. 1 Greek-street, Soho, November 17, 1859. (406)

MACHINERY of all Kinds DRAWN and
ENGRAVED on WOOD, with the greatest accuracy
of detail and Artistic Effect, by

J. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if
equipped. (343)

**TO ENGINEERS, ARCHITECTS, PATENT
AGENTS, &c.**

PHOTOGRAPHS OF THE HIGHEST CLASS
and of any size, taken and reproduced at a most
moderate rate of charge. Reproductions of faultless accu-
racy, of Machinery, Models, Drawings, &c. Orders at-
tended to in town and country. Estimates forwarded.

SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

MALLET'S PATENT BUCKLED

PLATES.—MR. ROBERT MALLET, C.E., In-
ventor and Patentee of these Plates (now being laid for the
Floor of the New Bridge, Westminster, and applicable to
Bridge, Wharf, and Fire-proof flooring, and to a variety of
other important purposes) gives notice that he has with-
drawn from this date all Licences whatsoever to manufac-
ture or vend his Patent Plates, and taken the management
of the Patent exclusively into his own hands. Applications
for the Plates to be made to the Patentee, who has arranged
for their prompt supply, at his office, 11 Bridge-street,
Westminster, S.W., and 97 Capel-street, Dublin.
18th May, 1859. (264)

COAL.—The THREE PITS COAL, nearly
equal to the best Wallsend, delivered free, 20s. per ton.
May be ordered of the keepers of most of the branch Post-
offices; or, by letter, of Mr. HERBERT CLARKE, Coal
Department, Great Northern Railway Station, King's-
cross, N. (424)

ESTABLISHED 50 YEARS.—I. ASTON'S

BOX AND IVORY RULE MANUFACTORY, No.
25 Old Compton-street, Soho. Surveyors' and Architects'
Drawing Scales, T-squares, Angles, Curves, Parallel
Rules, Marquois Scales, Horse Measures, Standards for
measuring Soldiers, Measuring Tapes, and every de-
scription of English and Foreign Rules and Scales made
to order. All sorts of Rules repaired. Wholesale and
Retail. (360)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts.

(215)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE---34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE.

(273)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c., &c., SUPPLIED

(80)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,
India-rubber Manufacturers, 9 Gresham-street West, E.C.
Mills--Tottenham, N. (380)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE
COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address--

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at
 one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and
 Mining purposes, with all necessary gearing for being driven by steam power.
 Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every
 purpose to which steam-power can be applied. When intended for winding,
 they are fitted with reversible link motion and winding gear. They are
 easy of removal, as may be seen by the engraving, and can be set to work
 immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business,
 and are prepared to send off engines and machinery of the before-mentioned
 kinds in a few days from the date of order. They would also call attention to
 the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants,
 Shippers, and Colonial Agents.

(23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam
 Ploughing can also be used for any
 other operation the Farmer may wish.
 They are all made to move themselves
 by Steam from field to field, or place to
 place, requiring but one or two horses in
 the shafts to steer them. The Ploughs
 are so constructed as to be adjusted to
 any width of Furrow, and they can also
 be used as a Subsoiler, Trenching-Plough,
 and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to

(394)

BODMER'S PATENT SAFETY VALVE.

—In this Safety Valve
 the force which raises
 the cap (a) is derived
 from the steam pres-
 sure exerted upon a
 column of water, ad-
 mitted from the boiler
 through the pipe (b),
 and is therefore quite
 independent of the
 steam which is about
 to escape. The valve
 is consequently ex-
 ceedingly sensitive,
 and capable of open-
 ing to the full extent
 of its area, especially
 in the case of a sudden
 accumulation of steam
 from whatever cause.

For further informa-
 tion apply to Messrs.
 R. & L. R. BODMER,
 2 Thavies' Inn, Holborn, or to Mr. WM. ROUTLEDGE, New
 Bridge Foundry, Salford, Manchester. (416)

FULLER BROTHERS, WINDOW BLIND

MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (325)

BIRMINGHAM WAGGON COMPANY

(LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for sixteen hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.**THE POCKET STEREOSCOPIC PANORAMA.**

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S,
85 King William-street, City. (345)

THE IMPERIAL IRON TUBE COM-

PANY (Successors to GEORGE B. LLOYD and Co.), Gas-street and Berkley-street, Birmingham, Manufacturers of Wrought Iron Tubes and Fittings, for Gas, Steam, and Water. Patent Glass-Enamelled and Galvanised Tubes, and Lap-welded Iron Boiler Tubes. (247)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COOKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.

LONDON.

(15)

THE LONDON WARMING AND VENTILATING COMPANY, (LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—Mr. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

(12)

LUND'S LONDON LEVER

FOR Drawing Corks is the most simple and efficacious Instrument ever offered to the public for removing the Corks from Bottles without disturbing the contents.

The use of this Lever prevents the possibility of any injury to the hand by the accidental breaking of the neck of the Bottle.

Sold by all Cutlers and Ironmongers, and at the Patentee's Wholesale Warehouse, 23, 24, 25 Fleet Street, London.

(178)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W.

(329)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed), Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations.

(132)

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C.

(284)

CONDY'S PATENT FLUID or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and DESTROYS FOR EVER the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp.

(238)

GOLD and TEETH.—Messrs. BROWNE

and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to Stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple.

(379)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels,
Railway Station,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln.

(340)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, contriving Machinery, Preparing Drawings, &c.

(345)

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers' and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES. } From 4 to 40 Horse Power, suited for every kind of work
SELF-PROPELLING AND TRACTION ENGINES. } to which Steam Power is applied.
STONE GRINDING MILLS.
MORTAR AND PUG MILLS.
MILLWRIGHTS' WORK of all kinds.
SAWING MACHINERY, from 4 to 20 Horse Power.
BRICK AND TILE MACHINES.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.
PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.
THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.
CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.
BARLEY AVELLING MACHINES.
CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.
PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.
PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.
PRIZE SEED AND MANURE DRILLS.
LIQUID, SEED, AND MANURE DROP DRILLS.
CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.
GARRETT'S PATENT HORSE HOE for all Crops.
PATENT REVOLVING HOES for Root Crops.
IMPROVED PLOUGHS AND REAPING MACHINES.
 &c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & Sons' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these Lists, with their names and addresses printed on, free of charge, by making application for the same.

Address—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

IMPORTANT TO MANUFACTURERS
MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathe-straps, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From **TRUMAN, HANBURY, BUXTON, & Co.,** Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the falling of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From **JAMES ABERNETHY & Co.,** Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strains, as that there is no chance of the band slipping; and with this precaution, and taking care in using *cross bands* that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacing, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE
BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of *leaden pipes* for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Hoses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Gr' vanic Batteries, &c., &c.

MANUFACTURED BY THE
Gutta Percha Company, Patenters,
18 WHARF ROAD, CITY ROAD, LONDON,

AND SOLD BY THEIR
WHOLESALE DEALERS IN TOWN AND COUNTRY.

ENGINEERING MACHINES AND

TOOLS TO BE SOLD.—A Six Horse-power High-pressure Engine and Boiler, together or separately; four lengths of bright wrought iron shafting, with cast iron pulleys and drums, turned, varying from 12 to 54 inches diameter, with plummer blocks and cast iron columns; the castings, funnel, and other iron work of a boiler-plate heating furnace; water-tue irons and other iron mounting for smith's forges; blowing fans, 18 and 24 inches diameter.
Planing, Bolt-screwing, Nut-shaping, Boring, Drilling, and Counter-sinking Machines; Punching and Shearing Machines for Iron from $\frac{1}{4}$ to $\frac{1}{2}$ inch thick; Machines to bend iron plates of any thickness, and to allow plates to be rolled to a complete circle.
Engravings, particulars, and prices on application, to J. TONN & Co., Kent Iron Works, Bridge-street, Greenwich, S.E. (429)

MACHINERY of all Kinds DRAWN and ENGRAVED ON WOOD, with the greatest accuracy of detail and Artistic Effect, by

J. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. '343

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.

Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."

PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)
14 Wellington-street North, Strand, London, W.C. (270)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

TO CAPITALISTS.

PATENT SUBMARINE TELEGRAPH CABLE.—The Patentee of a most important improvement in Submarine Telegraph Cables seeks the assistance of a Capitalist in order to carry out his invention immediately, and submit it to the Government test. He is enabled to offer very specific arrangements already made with a large Company in case of its adoption. No time should be lost, as the Government Report is to be sent in within a month; and none need apply who are not prepared to devote some energy to the undertaking. Application to be made to Messrs. EASTLAKE, Solicitors, Plymouth. (428)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.
SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.

WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarum when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.
Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

PARTNERSHIP.—TO IRONFOUNDERS,

AGRICULTURAL ENGINEERS, and MACHINE MAKERS.—A PARTNER WANTED, in an extensive and lucrative business in the above line in East Norfolk (established 50 years), or the Business to be Disposed of. The Stock and Machinery, which are of the latest make, with the most recent improvements, can be taken at a valuation. The fee simple of the premises, which consist of a foundry, yard, with suitable buildings and large show-rooms, also a substantial and commodious dwelling-house near, may be purchased or hired for a term of years.—Address, by letter only, to Mr. BRAY, Estate Agent, 16A King's-road, Bedford-row, London, W.C. (427)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

J. W. CLARE, C.E., Inventor of the Patent Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

METROPOLITAN BOARD OF WORKS.

MAIN DRAINAGE of METROPOLIS.—SOUTHERN OUTFALL TUNNEL SEWER.—To BUILDERS and CONTRACTORS experienced in Tunnel Works.—The Metropolitan Board of Works hereby give notice, that they will MEET in the Council Chamber, Guildhall, in the City of London, on Friday, the 6th day of January, 1860, at Twelve o'clock at Noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a MAIN BRICK SEWER, 7 miles 2,240 feet in length, or thereabouts (5,000 feet of this length being in tunnel), and for the execution of other works in connection therewith; such sewer to extend from a point in Erith Marshes, opposite Dagenham Reach, in the county of Kent, to Woolwich, and through and under Woolwich to Norman's-road, otherwise North Pole-lane, Greenwich, in the same county.

Parties desirous of submitting tenders may, upon payment of £3, obtain plans, sections, specification, form of tender, and other particulars on application to J. W. Basalgette, Engineer of the Board, at the office of the Board, between the hours of Nine a.m. and Four p.m.

Tenders, addressed to the Metropolitan Board of Works, must be delivered at the office of the Board, No. 1 Greek-street, Soho, before Four o'clock p.m. on Thursday, the 5th day of January, 1860, and no tender will be received after that hour.

The Board do not bind themselves to accept the lowest or any tender, and the party whose tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.

No. 1 Greek-street, Soho, November 17, 1859. (408)

PATENT WEDGE and GROOVED SUR-

FACE FRICTIONAL GEARING.—The PATENT FRICTIONAL GEARING COMPANY, Proprietors of ROBERTSON'S WEDGE SURFACE FRICTIONAL GEARING PATENTS, grant Licences to Users of Machinery, for the unlimited use of the System in their works, on very moderate terms, enabling them to make or order from any Mechanician the Machinery they require.

The Company possess Five Patents relating to this Frictional System, including (in addition to their Bevel and Mitre Wheels) a System of Disc Clutches and Clutch Movements, Wheel Clutching, Reversing, Differential, Speed Ring, Varying Speed, and Break Movements, and of Shafting, Pillow Blocks, Shafting Hangers, &c.

Frictional Wheels thus formed are applicable to the heaviest as well as the lightest kind of work, and, in addition to their being extensively in use for ordinary gearing purposes, have been in use for a considerable time applied to Mills for Rolling Iron, the Screw-Propeller, Incline-Winding Engines, Saw Mills, Pumping Engines, Flax Scutchers, Fan Blowers, Calico-Printing Machinery, Steam Winches, Cranes, Hoists, &c.

This system gives great facilities for simplifying Machines, and for mechanical combination, and has the advantage of being noiseless and cleanly, there being no oil or grease used on the wheels. Wheel Catalogues and Circulars, giving particulars, sent free by Post; also, a list of manufacturing Agents, and information regarding those who, from locality or experience, are best able to execute orders for the description of work required.

Office, 20 Buchanan-street, Glasgow 146)

COAL.—The THREE PITTS COAL, nearly equal to the best Wallsend, delivered free, 20s. per ton. May be ordered of the keepers of most of the branch Post-offices; or, by letter, of Mr. HERRER CLARKE, Coal Department, Great Northern Railway Station, King's-cross, N. (424)

GALVANIZED and CORRUGATED IRON

and every description of Galvanized Iron Goods.

W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E. All kinds of Iron-work Galvanized. (375)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS,

Particularly invite attention to their PATENT ARGAND LAMP OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 20 CARRIAGE STREET. (361)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any maker, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Threshing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,

Or Mr. OLIVER Farmer, Hatfield, Herts.

(215)

THE RAILWAY CARRIAGE COMPANY, OLDBURY, NEAR BIRMINGHAM.

LONDON OFFICE--34 GREAT GEORGE STREET, WESTMINSTER,

Manufacturers of every Description of

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE.

(278)

TO STEAM SHIP OWNERS, ENGINEERS, AND OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

Simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustrative of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED.

(89)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO.,

India-rubber Manufacturers, 9 Gresham-street West, E.C. MILLS--Tottenham. N.

(360)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £37 10s. per ton, £1 10s. per cwt.; samples of 25 lbs. forwarded on receipt of 8s. Packages free.

Address--

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W.

(334)

TO MANUFACTURERS, THE ENGINEERING, MECHANICAL, & BUILDING TRADES GENERALLY.

MESSRS. BOOTH & CO., AUCTIONEERS and BUILDERS' SALESMEN, having opened Registers for Public and Private Sales of all kinds of JOB LOTS, Surplus Stock, Stores, Tools, Implements, &c., &c., (either Old or New,) beg to call the attention of all parties to the only medium established of the kind, and to state that they are prepared to receive consignments of any weight, bulk, or value, and of any class of Goods for immediate Sale. Full particulars may be had for two stamps, at the BUILDING TRADES REGISTRY OFFICES, (established 1857,) 13 EASTCHEAP, LONDON, E.C. The Public Sales by Auction are held Weekly, on EVERY TUESDAY, at ONE O'CLOCK, and for the present at the BUILDERS' SALE GROUNDS, (established 1858,) 23 and 24 MARYLEBONE ROAD, REGENT'S PARK, W. Catalogues by Post for One Stamp. Advances on New Goods. All communications are held private and confidential.

(204)

LITHOGRAPHY AND WOOD ENGRAVING.

G. T. IZOD, Draughtsmen and Engravers on Wood, Architectural, Mechanical, Ornamental, and General Engravers. Tradesmen's Catalogues Designed and Illustrated, Facsimiles and Plans of Improvements, &c., &c., executed in the best manner, at the lowest possible charge. Estimates forwarded on receipt of particulars. G. T. Izod and Co., Tudor-street, New Bridge-street, opposite the City Gas Works, London.

BESSEMER STEEL--The Tenth Part of Bessemer's Patent for the Manufacture of Malleable Iron and Steel in Belgium to be sold. Apply to Mr. W. B. C., the Proprietor, by letter post paid, Poste Restante, Brussels, Belgium. See the Engineer of the 24th of June last.

(363)

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps, the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our now premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

COURT TESTIMONIAL FUND—

COMMITTEE.

WILLIAM FAIRBAIRN, Esq., Chairman.

Ivie Mackie, Esq. (Mayor). Joseph Whitworth, Esq.
Thomas Bazley, Esq., M.P. Benjamin Hick, Esq.
James A. Turner, Esq., M.P. John Penn, Esq.
Richard Cobden, Esq., M.P. John Boyd, Esq.

Mr. DAVID MORRIS, Secretary, 1 Market Place, Manchester.

At a Meeting of the Committee, held in the Town Hall, Manchester, the Mayor in the Chair:—

Resolved—"That a Circular be prepared, and signed by Mr Fairbairn as Chairman of the Committee, appealing to all interested in the subject of iron manufacture, for co-operation and assistance to the Court Fund, and that Mr. D. Morris, Secretary, issue such Circular, accompanied by blank forms for Subscriptions forthwith, so as to complete the labours of the Committee as early as possible."

"That when the Subscription List is completed, the sum raised shall be invested in the purchase of Annuities, or some other form of securing the comfort of the declining years of the survivors of the Court Family."

Considering the services rendered to the country by the inventions of HENRY CORT, and the present destitute condition of his Son and Two Daughters, all of them upwards of 70 years of age, the Committee look forward with confidence to all those interested in, or benefitted by, his inventions to assist in its efforts towards raising a sum sufficient for their future maintenance and support.

Subscriptions already received.

LAWRIE AND HAGGER, Metal Brokers
33 Lombard-street, E.C.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

BUILDING NEW QUAY, Hillgate.—For piling and building the new quay, and other works connected therewith, at Hillgate on the river Tyne. Plans, &c., office Mr. Johnstone, architect, 6 Clayton-street west, Newcastle. A copy furnished for £1, which will be returned on receipt of the tender. Tenders Mr. J. W. Swinburne, town clerk, Gateshead January 7th.

CHURCH, Bray.—For the erection of a new parish church at Bray. Plans, Rev. M. Whately, or office of Mr. William Slater, architect, Chatton Chambers, Regent-street, London. Tenders, Dec. 31st.

SCHOOL, Prestigue, Radnorshire.—For the building of a school-room on the site of the present school-room, Prestigue. Plans, &c., at Mr. Mansfield's, architect, Kingston, Herefordshire. The architect will supply quantities, the building to be of brick, with Bath stone dressings. Tenders, January 3.

DESIGNS AND ESTIMATES FOR CEMETERY, Liverpool.—For designs and estimates for enclosing, laying out, and embellishing the new cemetery for the parish of Liverpool. 1. A ground plan of the site, showing the roads and walks, the land to be set apart for ornamental planting; the sites of the chapels, the proposed general division of the cemetery, and also its division into grave spaces, lines of drainage, sites of the lodges, stove yards, offices, &c. 2. Sections showing earthwork for the re-arrangement of the surface, and the depth gradients, and dimensions of sewers and drains. Site includes 90 acres. Premiums of £100 for the best design; one of £50 and another of £30 for the second and third best. Competitors to state terms on which they will carry out the works. Plans, &c., of site, to the clerk. Estimates and plans to have a motto and a sealed envelope to contain a similar motto to that on the plan. To be endorsed "Plan for Liverpool New Cemetery." To E. Harvey, Esq., Clerk to the Liverpool Burial Board, 12 Castle-street, Liverpool, February 14th.

RAILWAY, Scotland.—For the works on the Auchterhouse deviation of the Dundee and Newtyle Railway, to be called the Auchterhouse contract; and for those of the line by Lochee, to be called the Lochee contract. The former is about three miles, and the latter about five miles in length. The rails and the sleepers supplied by the company. Drawings and specifications of Messrs. B. and E. Blyth, 135 George-street, Edinburgh; from whom duplicate schedules may be obtained on payment of 10s. Forms of tender from the Engineers, or the Secretary. Tenders with the Secretary, Dundee, January 3. Contractors, or their agents, to attend at the company's offices, at noon, on January 5.

DAY STONE DYKES, Scotland.—For building about four miles of dry stone dykes in the parish of Dundyre, Upper Ward of Lanarkshire. Specifications at the Stonypath; and tenders can be given in to Mr. Brown, forester on the Cornwall estate, or to Dr. Alton, Dolphinton, by the 9th January.

STEAM-ENGINE, BUILDINGS, &c., Dublin.—For the erection at the Richmond District Lunatic Asylum, Dublin, of a new drying-room and wash-house buildings, additional airing yards and sheds, dead house, new water closets, &c., and new drains to the old asylum, forming a refectory, and various other alterations and additions; also the erection of a steam boiler and four horse-power steam-engine for pumping water to the establishment,

with a considerable length of iron main pipes. Plan, and specification for the works, at the Asylum, North Brunswick-street; and further particulars from Mr. Wilkinson, architect, 49 Westland Row. Tenders to the Governors before 4 o'clock, January 9.

CHURCH WORK, Ireland.—For extensive works at the church of Fenagh, county Carlow, and for repairing Howth, county Dublin, to the plan and specification at the resident ministers of the parish. Proposals to the Ecclesiastical Commissioners for Ireland, Dublin, Dec. 29.

PARSONAGE HOUSE, Hyde.—Drawings and specifications in the vestry room of St. George's Church, Hyde. Tenders, 31st inst., Rev. A. Read, incumbent, Wood End, Hyde.

SCHOOLS, SCHOOL-HOUSE, AND OUTBUILDINGS, Otley, Yorkshire.—For the building of boys' and girls' schools, &c. The whole of the walls to be of stone. Plans, &c., offices Messrs. J. Child and Son, 23 Park-row, Leeds, to Dec. 27.

WAREHOUSES, Bradford, Yorkshire.—For the masons', joiners', plasterers', plumbers', glaziers', slaters', painters', and ironfounders' works required in the erection of three stuff warehouses, Foster's Buildings, in Well-street, Bradford. Drawings, &c., E. Milnes, 30 Hall Tugs.

POLICE STATION, Birmingham.—To be erected in Ladywood lane. Drawings, conditions, and copies of quantities, and form of tender, office of Mr. E. Holmes, architect, 25 Temple-row, Birmingham. Contractors wishing to compete to send in their names to the architect, Dec. 31st. Tenders, January 16th.

RAILS, Scotland.—For 600 tons for the Dundee and Newtyle Railway, to be delivered at Dundee during the months of April, May, June, and July, 1890. Specifications, Messrs. B. and E. Blyth, engineers, Edinburgh. Tenders with Mr. R. Alison, Secretary, Dundee, Jan. 3.

ELM TIMBER, Navy.—For supplying H. M. Dockyards with 5,320 loads of English elm timber, and 25 elm trees for pumps fitted between the middle of November last and the end of February next, and to be delivered (at prices including carriage and all other expenses) by the 30th Nov., 1890. Tenders may be made for the supply of any one or more of the yards, or for the whole of them. A distribution and a form of the tender may be obtained at the office of the Storekeeper-General, Somerset-place. Tenders to Jan. 10, with names of sureties to the extent of £1 per load.

PAVING STONES, CURBING, AND CHANNELLING, Waterloo-seaforth.—For 4,000 tons of square-set paving stones, 12,000 yards of curbing, and 12,000 yards of channelling. Samples and prices to be sent to the office of the Local Board, Jan. 2. Great George-road, Waterloo, near Liverpool.

PLAN OF TOWN HALL, COVERED MARKET, &c., Bishop Auckland.—£20 for the best plan. Full particulars, W. B. Cherritt, Secretary to the Directors of the Market Company. Plans to Feb. 11.

RAILWAY AGENT, India.—The Directors of the Bombay, Baroda, and Central India Railway Company desire to engage the services of a gentleman thoroughly competent to audit the railway engineer's accounts, conduct the correspondence, and generally to assist the managing agent, and be prepared to proceed to India immediately. Salary £600 per annum. Applications, stating general qualifications and railway experience, age, &c., Mr. C. H. Kennedy, offices, 10 Liverpool-street, New Broad-st., not later than the 28th inst.

PRACTICAL FOREMAN.—In an improving firm on the South Coast, one who thoroughly understands shipping, as well as general smiths', turners', and fitters' work, to take the superintendence of about twenty workmen. He must also be competent to take an order and to give an estimate. The situation will be permanent, with a rising salary to an efficient man. Address, stating terms and experience, to X. W., 21 Cardington-street, London, N.W.

ENGINEERING DRAFTSMAN.—Must be an experienced person, capable of designing and drawing engines and general machinery. Address, with references, B. J. K., 163 Strand, W.C.

FOREMAN BOILER-MAKER.—Accustomed to make locomotive boilers with a steam riveting machine. For particulars to E. Corty, 8 New Broad-street, E.C.

MANAGER FOR A COTTON BUSINESS AT Lagos, Western Africa.—Must be a gentleman of experience, practically acquainted with the cultivation of cotton. First-class references will be required, and communications will be strictly confidential. Salary liberal. Box T 5, Post-office.

MANAGER FOR A SMALL SPINNING AND WEAVING CONCERN in the country of 30-horse power, one with a family preferred. Address, Box 10, Post-office, Bacup.

MANAGER OF GAS-WORKS.—The Todmorden Gas Company require an experienced man to take the management of the works and to do the general business of a gas-making establishment. Address, Mr. J. Barker, engineer, Millwood, Todmorden, giving references, and stating salary required.

ESTABLISHED 50 YEARS.—I. ASTON'S BOX AND IVORY RULE MANUFACTORY, No. 25 Old Compton-street, Soho. Surveyors' and Architects' Drawing Scales, T-Squares, Angles, Curves, Parallel Rules, Marquois Scales, Horse Measures, Standards for measuring Soldiers, Measuring Tapes, and every description of English and Foreign Rules and Scales made to order. LAP-WELDED IRON BOILER TUBES.

(183)

CLAYTON, SHUTTLEWORTH, AND CO.,

OF LINCOLN,

78 LOMBARD STREET, LONDON, E.C.,

AND 36 DALE STREET, LIVERPOOL,

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

(23)

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam

Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to

JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

(368)

FOR DRIVING MACHINERY, MILLS, &c.—INDIA-RUBBER BANDS, improved make, to resist moist and dry heat, of any length, width, and thickness. Prices and instructions for use on application.

JAMES LYNE HANCOCK,

Vulcanised India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, (25)

CAUTION.

TO ARCHITECTS AND BUILDERS.—In consequence of numerous complaints, the Patentee begs to inform the above, that all genuine

For Swing Doors, are stamped with Name and Address, thus—

SMITH, PATENTEE, 69 PRINCES STREET, LEICESTER SQUARE, LONDON,

and that Springs thus marked are warranted.

SMITH'S PATENT WEATHER-TIGHT CASEMENT FASTENING AND SILL-BARS

are admitted by all to be the most perfect invention for the purpose. Diagrams and List of Prices on application.

(195)

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT SPHERICAL SELF-ADJUSTING BEARINGS, which do not heat in work. The advantages possessed by these Bearings are:—

- 1st. They are Self-adjusting; and, consequently, can be put down by the most ordinary Mechanic.
- 2nd. They are not liable to heat, even at high speeds.
- 3rd. They remain constantly parallel to the Spindle; and, therefore, wear equally all across the Bearing.
- 4th. They require only a very small quantity of oil.

Engravings and Prices forwarded on application to the Patentees.

WALLIS & HASLAM,

Engineers and Iron Founders, North Hants Iron Works, Basingstoke. (121)

RANSOME'S PATENT STONE FILTERS—

of every description for Domestic purposes, for Manufactories, Public Companies, Shipping, &c.

For Particulars, Specimens, Illustrations, and Agencies, apply to Mr. Frederick Ransome, Whitehall Wharf, Cannon-row, Westminster; or Patent Stone Works, Ipswich. A Liberal Discount allowed to the Trade or to Shippers.

(342)

PATENT STEAM PACKING, &c., &c.—TUCK'S PATENT ELASTIC PACKING AND PATENT METALLIC LININGS for STEAM ENGINES, PUMPS, &c.

ADVANTAGES.—A more perfect vacuum is obtained. Friction reduced, great saving in oil and tallow, and the Packing is gradually and completely worn away without becoming hard, THUS OBVIATING THE NECESSITY OF DRAWING THE OLD PACKING.

Orders received for the Patent Packing, also VULCANISED INDIA-RUBBER, in Sheets, Valves, &c., at the Offices, 35 CANNON-STREET, E.C. (304)

BODMER'S PATENT SAFETY VALVE.

—In this Safety Valve the force which raises the cap (a) is derived from the steam pressure exerted upon a column of water, admitted from the boiler through the pipe (b), and is therefore quite independent of the steam which is about to escape. The valve is consequently exceedingly sensitive, and capable of opening to the full extent of its area, especially in the case of a sudden accumulation of steam from whatever cause.

For further information apply to Messrs.

R. & L. R. BODMER,

2 Thavies' Inn, Holborn, or to Mr. Wm. ROUTLEDGE, New Bridge Foundry, Salford, Manchester. (410)

DRAUGHTS of COLD AIR

and DUST round Room, Office, or outside Doors and Windows EFFECTUALLY PREVENTED BY GREENWOOD'S PATENT INDIA-RUBBER STOPS, the most simple and effectual method of making air-tight joints to joiners' or cabinet work, old or new. These Stops can be had any length or pattern. Self-acting Spring Stops, for the bottoms of doors.

The Trade supplied.

JOHN GREENWOOD, Patentee, 10 Arthur-street West, London-bridge. (354)

NO ADJUSTMENT REQUIRED.—You have only to place one of

LUND'S LONDON RACK CORK SCREWS

on the neck of a bottle, and it is ready for use. Some of these Cork Screws are fitted with Patent Spring Ends to embrace the neck of the bottle, and so direct the worm through the centre of the cork.

Sold by the Patentee at 56 and 57 Cornhill, and 23 and 24 Fleet-street, London; and may be had at all Cutlery and Ironmongers'. (341)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capsuled. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 3s. 6d. (216)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 30-horse power, 30in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and destroys for ever the cause of infection. Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, musty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; in Pints, 2s.; Half-pints, 1s. and in bulk; 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (238)

GOLD AND TEETH.—Messrs. BROWNE

and CARTWRIGHT, the old-established Surgeon-Dentists, 22 Fleet-street, continue to Stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR
Private Residences, Farm Buildings, Churches, Chapels,
Railway Stations,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,
J. T. B. PORTER and CO., Lincoln. (346)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

PRICE'S DOUBLE PATENT FIRE-RESISTING AND BURGLAR-PROOF SAFES,

containing all the improvements under his two Patents of 1855 and 1859, and fitted with his "NE-PLUS-ULTRA" Lock, are Sold Retail from Ten to Thirty per Cent. under the Safes of other First-class Makers.

PRICE'S New Patent "NE-PLUS-ULTRA" LOCK is warranted unpickable against every known mode of picking, and from its simplicity of construction, nothing but absolute violence can throw it out of action; and the extra strength of its parts renders it the most durable Lock extant. Sold Retail, with Seven Acting Levers, Twenty per Cent. under other first-class Locks with but Six Levers.

Illustrated Price Lists of Safes and Locks (with Testimonials) free on application to the Patentee and Manufacturer, Cleveland Safe and Lock Works, Wolverhampton. (419)

BOURDON'S PRESSURE AND VACUUM GAUGES.

These instruments may be obtained from JOHN DEWARANCE & Co. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—
Manchester—ALLEN, HARRISON, & Co., Cambridge-street;
Routledge, New Bridge-street, Salford.
Glasgow—ALEXANDER MITCHELL, 350 Parliamentary-road.
Belfast—Geo. H. STRYKE, York-street Foundry.
Birmingham—ADAM DIXON, 48 Newhall-hill.
Newport, Mon.—H. POOLEY & SON.
Liverpool—MARSDEN, BRO., Argyle-street.
Swansea—J. W. COCKLE, 91 Oxford-street.
Plymouth—J. S. PHILLIPS, Great Western Dock Office.
Newcastle-on-Tyne—GEORGE HARLE, Dean-street. (395)

FULLER BROTHERS, WINDOW BLIND

MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (325)

BIRMINGHAM WAGGON COMPANY

(LIMITED) has RAILWAY WAGGONS FOR HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WHITE, 6 Essex-street, Strand. (369)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE POCKET STEREOSCOPIC PANORAMA,

FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S,
85 King William-street, City. (345)

RICHARD BAIRD, GENERAL COM-

MISSION AGENT, AND CONTRACTOR for all descriptions of RAILWAY PLANT and STOKES.
13 DOCK STREET, DUNDEE. (380)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM-ENGINE.
FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.
PRIZE OF £10 FOR FIXED STEAM ENGINE.
FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as Finishing the Corn for Market.
And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND,

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,
PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN FOR MARKET AT ONE OPERATION,
IMPROVED CIRCULAR-SAW BENCHES,
CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,
PATENT CORN-DRESSING MACHINES AND BLOWERS,
CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents. (315)

VENETIAN HOUSE, ESTABLISHED 1826.

IMPROVED MACHINERY FOR AGRICULTURISTS.

RICHARD GARRETT & SONS,

LEISTON WORKS, SAXMUNDHAM, SUFFOLK,

(ESTABLISHED A.D. 1778),

EARNESTLY solicit the continued support of their numerous Friends, Agriculturists, Shippers, and others; the additions made to their Works during the present year, in the erection of new sets of Workshops, fitted with the best mechanical appliances for producing Machinery of the most improved construction, expeditiously and economically, justifies their soliciting increased support, while their leading reputation as Inventors and Manufacturers of First Class Agricultural Machinery, is a sufficient guarantee that every Machine supplied from Leiston Works will prove to the entire satisfaction of the purchaser.

R. G. & S. are now manufacturing the following Machines and Implements, which they guarantee to be thoroughly efficient in every respect:—

PORTABLE AND FIXED STEAM ENGINES.

SELF-PROPELLING AND TRACTION ENGINES.

STONE GRINDING MILLS.

MORTAR AND PUG MILLS.

MILLWRIGHTS' WORK of all kinds.

SAWING MACHINERY, from 4 to 20 Horse Power.

BRICK AND TILE MACHINES.

From 4 to 40 Horse Power, suited for every kind of work to which Steam Power is applied.

IMPROVED SETS OF FARM MACHINERY, for Large Occupations.

PORTABLE AND FIXED MACHINERY, for Thrashing and Dressing Corn.

THE PRIZE BOLTING AND OPEN-DRUM HORSE-POWER THRASHING MACHINES.

CORN DRESSING MACHINES, for Hand, Horse, Water, and Steam Power.

BARLEY AVELLING MACHINES.

CHAFF CUTTERS, for Hand, Horse, Water, and Steam Power.

PATENT TURNIP CUTTING AND PULPING MACHINES.

THE PRIZE CORN AND SEED DRILLS.

PRIZE CORN AND SEED DRILLS WITH MANURE APPARATUS.

PRIZE SEED AND MANURE DRILLS.

LIQUID, SEED, AND MANURE DROP DRILLS.

CHAMBER'S PATENT BROADCAST MANURE DISTRIBUTOR.

GARRETT'S PATENT HORSE HOE for all Crops.

PATENT REVOLVING-HOES for Root Crops.

IMPROVED PLOUGHS AND REAPING MACHINES.

&c. &c. &c.

Of which full detailed particulars will be found in R. G. & SONS' ILLUSTRATED CATALOGUE, sent postage free to any address, in English, French, or German; and any of the above Machines will be shown in operation at R. G. & SONS' Farm, near the Works, on their receiving a few days' notice.

A Copy of R. G. & SONS' new COLONIAL LIST will be forwarded free to any of the Colonies, and Shippers will be supplied with these Lists, with their names and addresses printed on, free of charge, by making application for the same.

ADDRESS—R. GARRETT & SONS, LEISTON WORKS, SAXMUNDHAM, SUFFOLK. (161)

WATER POISONED BY LEADEN PIPES.

"The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight. The water has cut these deep pits almost through the pipe, and not only upon the portion which we have illustrated, but has formed similar chasms throughout the entire length."—*Expositor.*

Poisoned Water Preventable.

BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

Resistance of Frost.

The Gutta Percha Company have been favoured with the following Letters in reference to the non-conducting properties of Gutta Percha Tubing, in the resistance of Frost.

From J. ARMSTRONG, Esq., M.D., Gravesend.

"My private house, which was supplied with your Gutta Percha Tubing some five or six years ago, has never required the slightest attention; and previously, there was no winter passed that we were not deluged in consequence of the bursting of the leaden pipes."

From HENRY BROWN and SONS, Western Works, 108 Rockingham-street, Sheffield.

"We have now a positive proof of the frost-resisting properties of the Gutta Percha Piping. On our premises we have a leaden Pipe and a Gutta Percha one lying side by side. The leaden one has been completely frozen up at least ten days, and the Gutta Percha one is still unaffected."

Every Variety of Gutta Percha Article.

ENGINEERING MACHINES AND TOOLS TO BE SOLD.—A Six Horse-power High-pressure Engine and Boiler, together or separately; four lengths of bright wrought iron shafting, with cast iron pulleys and drums, turned, varying from 12 to 54 inches diameter, with plummer blocks and cast iron columns; the castings, funnel, and other iron work of a boiler-plate heating furnace; water-tuo irons and other iron mounting for smith's forges; blowing fans, 18 and 24 inches diameter.
Planing, Bolt-screwing, Nut-shaping, Boring, Drilling, and Counter-sinking Machines; Punching and Shearing Machines for Iron from $\frac{1}{4}$ to $1\frac{1}{2}$ inch thick; Machines to bend iron plates of any thickness, and to allow plates to be rolled to a complete circle.
Engravings, particulars, and prices on application, to J. TODD & CO., Kent Iron Works, Bridge-street, Greenwich, S.E. (429)

TO SHIPBUILDERS.

IRON SHIPS may be rendered FIRE-PROOF if internally fitted with Fibrous Slab in lieu of Deal.
Extract from a letter of the Captain of the Royal Bride Steamer, trading between Bristol and Melbourne:—"25th May, 1859.—From my experience of the last nine months in all climates, I have no hesitation in saying there is no kind of lining I know of equal to your Fibrous Slab for Iron Ships.—Yours, &c. (Signed), ALEX. NEWLAND."
PATENT WOOD OR FIBROUS SLAB COMPANY, (Limited)
15 Wellington-street North, Strand, London, W.C. (270)

MACHINERY of all Kinds DRAWN and ENGRAVED ON WOOD, with the greatest accuracy of detail and Artistic Effect, by
J. WALMSLEY,
2 Walbrook-buildings, City, E.C.

Artists sent to all parts of the United Kingdom, if required. '343

SAW SHARPENER (SANNIER'S PATENT).
—TO BUILDERS and SAW-MILLS.—By the use of this Machine files are dispensed with, and one man, with a little practice, will be able to sharpen (with mathematical precision) Eight Saws, where he can now sharpen only one. For particulars and information apply to Mr. S. Edward Braithwaite, No. 8 Bridge-st., Westminster, W. (435)

EXPERIMENTAL BOAT FOR SALE.
28 feet long by 5 feet, fitted with screw propeller, tube and shaft, adapted for steam machinery; price £7 10s. For further particulars apply to A. C. Hedges, 114 Jermyn-street, London. (436)

HART & SON, MALLEABLE IRON-FOUNDERS, 4 Vine-street, York-road, Lambeth.
Orders for Malleable Iron Castings executed within a week. (77)

TO CAPITALISTS.

PATENT SUBMARINE TELEGRAPH
CABLE.—The Patentee of a most important Improvement in Submarine Telegraph Cables seeks the assistance of a Capitalist in order to carry out his invention immediately, and submit it to the Government test. He is enabled to offer very specific arrangements already made with a large Company in case of its adoption. No time should be lost, as the Government Report is to be sent in within a month; and none need apply who are not prepared to devote some energy to the undertaking. Application to be made to Messrs. EASTLAKE, Solicitors, Plymouth. (423)

TO ENGINEERS, ARCHITECTS, PATENT AGENTS, &c.

PHOTOGRAPHS OF THE HIGHEST CLASS and of any size, taken and reproduced at a most moderate rate of charge. Reproductions of faultless accuracy, of Machinery, Models, Drawings, &c. Orders attended to in town and country. Estimates forwarded.
SPENCER, READ, & Co., 4 Agar-street, Strand, W.C. (90)

TO ENGINEERS, BOILER-MAKERS, AND OTHERS.
WALKER'S PATENT FRICTIONLESS FLOAT, for indicating the height of water in Boilers.

This Float combines extreme sensitiveness with simplicity; it also acts as an Alarum when the water falls low in the boiler. For a description, with Engravings, see the MECHANICS' MAGAZINE for October 28th. Testimonials have been given as to their efficiency by many eminent Engineers, and they are not expensive. For further particulars apply to the Patentee, whose works are at No. 58 Oxford-street, Birmingham; or Mr. J. W. Wilson, Civil and Mechanical Consulting Engineer, 9 Buckingham-street, Strand, London, where they also may be seen. (377)

PARTNERSHIP.—The ADVERTISER is desirous of entering as Junior Partner in an Engineering and Ship-building concern. He has several highly useful Inventions applicable to Steam and Shipbuilding, which he would Patent in the name of the firm. He is capable of Designing and making Finished and Working Drawings of Ships, Steam Engines, &c., and would devote his whole time and attention to the business.
Address, T. M., MECHANICS' MAGAZINE Office, 166 Fleet-street. (361)

PARTNERSHIP.—TO IRONFOUNDERS, AGRICULTURAL ENGINEERS, and MACHINE MAKERS.—A PARTNER WANTED, in an extensive and lucrative business in the above line in East Norfolk (established 50 years), or the Business to be Disposed of. The Stock and Machinery, which are of the latest make, with the most recent improvements, can be taken at a valuation. The fee simple of the premises, which consist of a foundry, yard, with suitable buildings and large show-rooms, also a substantial and commodious dwelling-house near, may be purchased or hired for a term of years.—Address, by letter only, to Mr. BRAY, Estate Agent, 16a King's-road, Bedford-row, London, W.C. (427)

MALLET'S PATENT BUCKLED PLATES.—MR. ROBERT MALLET, C.E., Inventor and Patentee of these Plates (now being laid for the Floor of the New Bridge, Westminster, and applicable to Bridge, Wharf, and Fire-proof flooring, and to a variety of other important purposes) gives notice that he has withdrawn from this date all Licences whatsoever to manufacture or vend his Patent Plates, and taken the management of the Patent exclusively into his own hands. Applications for the Plates to be made to the Patentee, who has arranged for their prompt supply, at his offices, 11 Bridge-street, Westminster, S.W., and 97 Capel-street, Dublin. 18th May, 1859. (264)

J. W. CLARE, C.E., Inventor of the Patent Steam Engine, Boiler, and Furnace, whereby one-fourth is saved in the first cost of construction. Only three pounds of the cheapest coal is amply sufficient to generate each horse power of steam required; and the escape of black smoke is entirely prevented. Also of the Patent Railway Break, and Instant Communicator between Driver and Guard, whereby a powerful retarding influence can be applied to every carriage throughout a train, sufficient to stop it while at any speed, in 100 yards if necessary. For further plans, &c., apply at 2 Surrey-square, Old Kent Road, S.E. (344)

TO RAILWAY COMPANIES, ENGINEERS, MILL-OWNERS, &c., &c.

THE PATENT PLUMBAGO CRUCIBLE
COMPANY draw the attention of all Owners of Machinery to their fine POWDERED PURE FLOUR PLUMBAGO, which they can confidently recommend for Anti-friction purposes, being an impalpable powder, and warranted perfectly free from grit and any impurity.

For ordinary polishing purposes it will be found superior to any Black Leads offered.

Price £27 10s. per ton, £1 10s. per cwt.; samples of 28 lbs. forwarded on receipt of 8s. Packages free.

Address—

THE PATENT PLUMBAGO CRUCIBLE COMPANY,
Battersea Works, London, S. W. (334)

METROPOLITAN BOARD OF WORKS.

MAIN DRAINAGE OF METROPOLIS.—SOUTHERN OUTFALL TUNNEL SEWER.—To BUILDERS and CONTRACTORS experienced in Tunnel Works.—The Metropolitan Board of Works hereby give notice, that they will MEET in the Council Chamber, Guildhall, in the City of London, on Friday, the 6th day of January, 1860, at Twelve o'clock at Noon precisely, and will then be prepared to open TENDERS by parties who may be willing to CONTRACT for the CONSTRUCTION of a MAIN BRICK SEWER, 7 miles 2,240 feet in length, or thereabouts (5,000 feet of this length being in tunnel), and for the execution of other works in connection therewith; such sewer to extend from a point in Erith Marshes, opposite Dagenham Reach, in the county of Kent, to Woolwich, and through and under Woolwich to Norman's-road, otherwise North Pole-lane, Greenwich, in the same county.

Parties desirous of submitting tenders may, upon payment of £3, obtain plans, sections, specification, form of tender, and other particulars on application to J. W. Bazalgette, Engineer of the Board, at the office of the Board, between the hours of Nine a.m. and Four p.m.

Tenders, addressed to the Metropolitan Board of Works, must be delivered at the office of the Board, No. 1 Greek-street, Soho, before Four o'clock p.m. on Thursday, the 5th day of January, 1860, and no tender will be received after that hour.

The Board do not bind themselves to accept the lowest or any tender, and the party whose tender shall be accepted will be required to provide two approved sureties for the due performance of the works.

E. H. WOOLRYCH, Clerk of the Board.

No. 1 Greek-street, Soho, November 17, 1859. (408)

TO INVENTORS.

MR. P. E. CHAPPUIS,

69 FLEET-STREET, LONDON,

PATENTEE and MANUFACTURER OF REFLECTORS, STEREOSCOPES, and MIRRORS,

ALSO,

PHOTOGRAPHER.

Is prepared to introduce to his numerous connexion any NEW INVENTION of a PRACTICALLY USEFUL CHARACTER, likely to be generally adopted if brought out by an energetic and experienced agent. The Article must be such as may be exhibited in a shop window, and the samples of a very portable kind. (434)

COAL.—The THREE PITS COAL, nearly equal to the best Wallsend, delivered free, 20s. per ton. May be ordered of the keepers of most of the branch Post-offices; or, by letter, of Mr. HERBERT CLARKE, Coal Department, Great Northern Railway Station, King's-cross, N. (424)

GALVANIZED and CORRUGATED IRON and every description of Galvanized Iron Goods.

W. TEMPLE & CO., Glasshouse-yard, East Smithfield, E.
All kinds of Iron-work Galvanized. (375)

TO RAILWAY COMPANIES, CONTRACTORS, AND OTHERS.

GEORGE NEIGHBOUR and SONS, OIL MERCHANTS,

Particularly invite attention to their PATENT ARGAND LAMP, OIL, for Railway Roof and Signal Lamps; also to their EXTRA-REFINED ENGINE OIL, for Locomotive and Machine purposes. Prices forwarded on application.

127 HIGH HOLBORN, LONDON, W.C.

Agent at MANCHESTER—E. S. ROGERS, 33 Cannon Street. (344)

STEAM CULTIVATION.

CHANDLER AND OLIVER

HAVE much pleasure in being able to state that they are now prepared to execute orders for their PATENT STEAM WINDING ENGINES AND PLOUGHS, for Cultivating Land by Steam.

The WINDING TACKLE can be fitted to Engines of any make, and the Plough can be made to take any kind of apparatus necessary for Cultivating the Soil, such as Scarifier Tines or Broad Shares, &c. Any Engine now used by farmers can be fitted with the Tackle. It is light and simple, and an ordinary Farm Labourer can work it.

The Engine can be used for Thrashing without taking the Ploughing Tackle off, not requiring more than three or four horses to take it from place to place.

These Engines are very useful for Pile Driving or Drawing Ballast up inclined planes; at the same time they can be used for Pumping. Farmers will find them most useful for all purposes.

Messrs. CHANDLER and OLIVER are prepared to receive orders for separate Windlasses, which are light and simple, and generally useful.

For further Information apply to

ROBERT CHANDLER, ENGINEER, BOW, NEAR LONDON,
Or Mr. OLIVER Farmer, Hatfield, Herts.

RAILWAY PLANT AND IRONWORK.

NEW and SECOND-HAND RAILWAY WAGGONS always in Stock for SALE or HIRE

(278)

TO STEAM SHIP OWNERS, ENGINEERS, AND
OTHERS.

How's Patent Steam Engine Counters, can be read at sight.

These Counters register the number of revolutions made by an engine or other mechanism. They may be used for ascertaining the duty of Pumping Engines and Water-wheels; the revolutions on board a steam-vessel; to calculate the slip of the propeller; and in a locomotive to test the slip of the wheels.

How's Patent Salinometer, for Steam Boilers using Salt Water.

By these, the density of the water in the Boiler is at all times accurately shown, and a saving of boiler and fuel is effected. They are adopted by the Admiralty, the Honorable Trinity Corporation, and others. Copies of Testimonials from Messrs. Penn, Messrs. Maudslay, and others, will be forwarded on application.

How's Engine-Room Telegraph, for communicating between Captain and Engineer.
Society of Arts Prize Medal, 1855.

This is a Mechanical Telegraph, and by its peculiar construction, error or misunderstanding is rendered impossible. It is now extensively adopted, and gives great satisfaction.

How's Patent Fresh Water Apparatus for Ships' Use.

This apparatus is designed for the distillation of Fresh from Salt Water; and on long voyages, and where the supply of water is scanty, it will be found invaluable. Testimonials may be seen.

Patent Steam Pump and Fire-Engine for Ships' Use.

This Steam-pump occupies but a small space; works perfectly noiselessly, and throws an immense volume of water. An Illustrated Circular of Fresh Water Apparatus and Steam-pump combined, free on application.

How's Patent Machine for Cutting Bolts, Rods, Spindles, Wire, &c.

simple in construction, inexpensive, occupies but little space, and will not easily get out of order.

A Pamphlet Illustration of the above, sent free by post, on application to

A. P. HOW, ENGINEER,
81 MARK LANE, LONDON.

EVERY DESCRIPTION OF ENGINEERS' TOOLS, ENGINE ROOM STORES, &c. &c., SUPPLIED.

(289)

THE JUDGES AWARDED the following PRIZES to Messrs. HORNSBY and SONS, at CHESTER:—

FIRST PRIZE OF £25 FOR BEST PORTABLE STEAM ENGINE.

FIRST PRIZE OF £20 FOR BEST COMBINED THRASHING, SHAKING, DRESSING, and FINISHING MACHINE, being the highest award offered.

PRIZE OF £10 FOR FIXED STEAM ENGINE.

FIRST PRIZE OF £5 FOR THE BEST CORN-DRESSING MACHINE, adapted for Rough Chaffing, as well as for Finishing the Corn for Market.

And FIVE "HIGH COMMENDATIONS" for various other Machines, including STEAM-ENGINES, THRASHING MACHINES, and CAKE BREAKERS.

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE,
ENGLAND.

INVITE the attention of Agriculturists, Shippers, Merchants, and others, to their Improved AGRICULTURAL MACHINERY, comprising—

PATENT PORTABLE STEAM-ENGINES,

PATENT COMBINED MACHINES FOR THRASHING AND PERFECTLY DRESSING CORN

FOR MARKET AT ONE OPERATION,

IMPROVED CIRCULAR-SAW BENCHES,

CORN, SEED, AND MANURE DRILLS, OF ALL KINDS,

PATENT CORN-DRESSING MACHINES AND BLOWERS,

CHAFF CUTTERS, CAKE BREAKERS, PLOUGHS, &c., &c.,

The pre-eminent excellence of which is fully attested by the numerous Prizes which have been awarded to them in the United Kingdom, on the Continent of Europe, and in the Colonies, numbering in all about 200 Money Prizes, of £1,400 value, and 21 Gold, Silver, and 1 Bronze Medals, including the Great Council Medal at the Exhibition of the Industry of All Nations, London, 1851; the Grand Medal of Honour at the Universal Exposition, Paris, 1855; Three Gold Medals at the Universal Agricultural Exposition, Paris, 1856; the Gold Medal of the Imperial Royal Agricultural Society of Austria, Vienna, 1857; the Gold Medal of the Agricultural Society of Gers, Condom, 1857; and the First Prize of the Agricultural Society of Geelong, Australia.

Illustrated Catalogues, with Prices of Engines and Thrashing Machines, greatly reduced for the present year, sent Free by Post on application to

R. HORNSBY AND SONS,

SPITTLGATE IRON WORKS, GRANTHAM, LINCOLNSHIRE, ENGLAND.

For EXPORTATION.—Engines, Machinery, and Implements, specially adapted, may be had through all British Merchants and Shipping Agents.

ROBERT M. LATHAM, Secretary.

Influential applications for agencies from unrepresented districts will be entertained, and liberal terms accorded. (430)

COURT TESTIMONIAL FUND.

COMMITTEE.

WILLIAM FAIRBAIRN, Esq., Chairman.

Ivlie Mackie, Esq. (Mayor). Joseph Whitworth, Esq.
Thomas Bazley, Esq., M.P. Benjamin Hick, Esq.
James A. Turner, Esq., M.P. John Penn, Esq.
Richard Cobden, Esq., M.P. John Boyd, Esq.

Mr. DAVID MORRIS, Secretary, 1 Market Place, Manchester.

At a Meeting of the Committee, held in the Town Hall, Manchester, the Mayor in the Chair:—

Resolved—"That a Circular be prepared and signed by Mr Fairbairn as Chairman of the Committee, appealing to all interested in the subject of iron manufacture, for co-operation and assistance to the COURT FUND, and that Mr. D. MORRIS, Secretary, issue such Circular, accompanied by blank forms for Subscriptions forthwith, so as to complete the labours of the Committee as early as possible.

"That when the Subscription List is completed, the sum raised shall be invested in the purchase of Annuities, or some other form of securing the comfort of the declining years of the survivors of the COURT FAMILY."

Considering the services rendered to the country by the inventions of HENRY CORT, and the present destitute condition of his Son and Two Daughters, all of them upwards of 70 years of age, the Committee look forward with confidence to all those interested in, or benefitted by, his inventions to assist in its efforts towards raising a sum sufficient for their future maintenance and support.

LIST OF MISCELLANEOUS TENDERS INVITED, AND ENGAGEMENTS OPEN.

The tenders and vacancies which appear in this weekly list are not repeated in succeeding numbers.

TELESCOPES, Navy.—For supplying Her Majesty's dockyard, at Woolwich, with 300 telescopes within three months from the date of contract, and such further quantities under a contract for twelve months certain, and afterwards until the expiration of six months warning, such further supplies to be delivered within six weeks of each demand. Pattern, conditions, and form, office of storekeeper general, Somerset-place. Tenders to January 3. Attendance of party or agent necessary, as also the names of two sureties for £200.

MARKS OF DISTINCTION, Navy.—For supplying and delivering into Her Majesty's victualling stores at Deptford, Gosport, and Plymouth, all such marks of distinction for twelve months and further until three months notice. Patterns, Somerset-place, and at the victualling yards of Gosport and Plymouth, where also see modification of conditions of contract, and obtain forms. Tenders to January 5. Attendance not necessary.

PIG LEAD AND COPPER, India Board.—For supplying the required quantity of pig lead and copper (two contracts). Tenders to the secretaries' office, January 3.

STORES, River Wear Commissioners.—For the supply during the ensuing year of A, malleable and cast-iron; B, nails, hardware, &c.; C, brass castings; F, coals. Forms of application at the engineer's office, to be filled up, signed, and sent to the office January 3.

CANVAS HOSE, Liverpool.—For 300 yards of best 2½-inch canvas hose, for hydrants, &c. Sealed tenders endorsed "Tender for hose," to be left with sample of article proposed to be supplied, at office of Mr. H. J. Hagger, vestry clerk, Liverpool. January 5.

EPISCOPAL PALACE, Gloucester.—For the rebuilding of the Episcopal Palace, Gloucester. Application by letter to Mr. Christian, architect, 10 Whitehall-place, London, S.W., immediately.

EPISCOPAL PALACE, Bangor.—For the rebuilding of the Episcopal Palace. Application by letter immediately to Mr. Christian, 10 Whitehall-place, London, S.W.; references will be required. Bills of quantities, Messrs. Bunker and Goodman, surveyors, 8 St. Martin's-place, Charing-cross, London, W.C.

CHAPEL, Portland Town.—For the erection of new galleries, staircases, &c., in Victoria Terrace Chapel. Drawings, &c., office of Mr. J. Tarring, 26 Bucklersbury, City. Tenders January 6. Half-a-guinea will be charged for the quantities.

GOODS WAREHOUSE, North Eastern Railway.—For the construction of a goods warehouse at the Tyne dock. Plans, &c., at engineer's office. Central station, Newcastle. Tenders to January.

CEMETERY, Bath, Parish of St. Saviour's.—For the whole or separate portions of the necessary works for the building and erection of chapels and entrance gates, with the enclosing, laying out, draining, and embellishing the burial ground attached thereto. Drawings and specifications, office of Messrs. Hickes and Isaac, architects, 13 Northgate-street, Bath. Tenders, Jan. 28.

SEWERAGE, Wakefield.—For the sewerage and paving of Milton-street, within the district of the Local Board of Health. Plans, &c., of Mr. T. Dale, C.E., Borough surveyor, Barstow-square, Wakefield. Tenders, Jan. 2.

UNDERPINNING SEWER, Paddington.—For underpinning about 2,000 feet of brick sewer in Bishop's-road and Westbourne-grove, together with other works incidental thereto. Specifications, &c., the surveyor, vestry hall, Harrow-road. Tenders, Jan. 2.

ROAD, BRIDGES, &c., Hilsa, near Portsmouth.—For certain earthworks, widening and deepening channels, forming roads, bridges, &c. Attendance required at the Royal Engineer's office, Galecombe-house, Hilsa, 4th Jan., at two o'clock, to appoint a surveyor to take out the quantities in conjunction with the Government surveyor. Each party will be required to pay the sum of 8 guineas for the quantities.

PLANS FOR LAYING OUT LAND FOR BUILDING, Newport, Salop.—The Newport Town and Marsh Trustees will pay £10 for the plan they may consider the best to lay out for building sites, several pieces of land in the Marsh. Particulars, Mr. H. Heane, Newport, to whom plans must be delivered with motto and the name in a sealed envelope, March 1.

PLANS FOR LAYING OUT LAND FOR BUILDING, Rhyll.—For a good block plan as to the most advantageous manner

of laying out for building 4 acres of land, with considerable frontage to the sea at Rhyll. A plan and section of the site, &c., Messrs. Churton, auctioneers, Chester. Twenty guineas for the best, and ten guineas for the second best plan. The architect to furnish designs of the elevation of such houses as he recommends.

SURVEYOR, Newport, Monmouthshire.—Salary £200 per annum and office. Must be an engineer, and a knowledge of architecture would be desirable. To act as inspector of gas metres. Whole time. Applications to the town clerk, Jan. 2.

FURNACE MANAGER.—One who thoroughly understands his business. Apply by letter, A. X., Post-office, West Bromwich.

MOULDERS.—Four good hands for jobbing and stove grate work. Apply to Baker and Co., Bishop-street, Birmingham.

By Royal

Letters Patent.

T. SUFFIELD AND CO.

Call the particular attention of

SHIP-OWNERS, SHIP-BUILDERS, AND COMMANDERS OF STEAM AND SAILING VESSELS,
to the Simple and Efficient Arrangements of their

PATENT PUMPS AND FIRE-ENGINES,

Both Fixed and Portable, with PATENT VALVES and other Improvements.

These Pumps are free from that liability to choke which is common to other Pumps, and their Working Parts are not susceptible of derangement either from wear or from being long out of use. They pass entirely through them, with ease, any substance that may enter the Suction Pipes. The Novelties in these Pumps are their adaptation to the varied duties of Ships' Pumps; the facilities they afford for Cleansing the Suction Pipes, and for Sounding or Examining the Valves; the readiness with which they may be used for Ventilating the Bilge, or for acting as a Syphon either for Watering the Ship, or for extinguishing Accidental Fires on board: the rapidity with which they can be converted into Fire Pumps, or be applied to the Washing of Decks; and their capability of Pumping from Several Compartments. Also, to their

MARINE ENGINE-ROOM TELEGRAPHS,

Which excelled all others in the recent series of Trials in Her Majesty's Navy at Sheerness. These invaluable instruments have been supplied and sent to almost all parts of the world, and in no case has there been any complaint of their working.

Testimonials, bearing uniform evidence of the complete success of these Telegraphs, may be had upon application.

IMPROVED ENGINE-ROOM COUNTERS,

Suitable for testing the speed of all classes of machinery.

IMPROVED

HYDROMETERS, SALINOMETERS,

With Coolers and Dippers for same. Injection Tallow-Cocks, and various kinds of Syringes.

IMPROVED MARINE DISTILLING APPARATUS,

Which will be found both Simple and Efficient for the Distillation of Fresh from Salt Water.

IMPROVED SHIPS' WATER-CLOSETS,

Made to act when placed either above or below the water level. These Closets are simple, efficient, and mechanically arranged for their various requirements, and are not liable to derangement.

IMPROVED STEAM COCKS, WATER GAUGES,

And all kinds of Steam Fittings of the very best quality. As a large Stock of every variety of this class of goods has been much sought after, we trust the present one (especially considering it can be so readily examined in our new premises) will be fully appreciated and meet with the attention it deserves.

GRAUTOFF'S IMPROVED STEAM AND VACUUM GAUGES

For which we are the sole appointed Agents) and which after having been tested for some time, are now patronised by the Lords of the Admiralty, Besides BOURDON'S and other Gauges which are also supplied by us to order.

IMPROVED STEAM WHISTLES, LUBRICATORS, LAMPS, OIL FEEDERS,

And Stores of every description supplied on the shortest notice.

T. SUFFIELD & CO.

Being practical Brass Manufacturers, Copper Smiths, Plumbers, Engineers, and Gun Metal Steam Cock Makers, are in a position to undertake and carry out with very great dispatch and economy all orders entrusted to them. In PAINTING and DECORATIVE Work also, lengthened experience enables them to compete most successfully with others, and they are at all times most ready to furnish estimates for this class of work when required to do so. They also respectfully solicit the attention of STEAM SHIP BUILDERS and OWNERS to their Large and Varied STOCK of

ASSORTED STORES FOR MARINE PURPOSES.

They keep a Large Stock of Goods, of their own Manufacture and from the Best Makers, constantly on view; so that by a visit to their Works or Depot, much valuable time may be saved by Managers, Engineers, and other Gentlemen who may require such Stores, together with a further saving in the cost of the Articles.

DEPOT, 116 FENCHURCH STREET, E.C.,

(OPPOSITE MARK LANE.)

MANUFACTORY, 12 & 13 BERMONDSEY WALL, S.E.**LONDON.**

(15)

VINEGAR.—Patronised by Her Majesty's Government.

CONDY'S PATENT PURE CONCENTRATED MALT VINEGAR.

Families, by using this delicious VINEGAR, insure purity and effect a saving of 50 per cent. See "Report of Dr. Letheby, City Officer of Health, Dr. Hassall, of the 'Lancet' Commission, and others." Sold by the Trade, in Bottles, labelled and capped. Wholesale—63 King William-street, London-bridge, E.C. Six Quart Samples sent free to any Railway for 5s. 6d. (216)

HORIZONTAL HIGH-PRESSURE STEAM ENGINES FOR SALE.

One of 8-horse power, 8in. cylinder, and 18in. stroke.
One of 10-horse power, 10in. cylinder, and 24in. stroke.
Two of 12-horse power, 12in. cylinder, and 24in. stroke.
One of 14-horse power, 12in. cylinder, and 36in. stroke.
Two of 14-horse power, 14in. cylinder, and 24in. stroke.
One of 16-horse power, 14in. cylinder, and 36in. stroke.
Two of 20-horse power, 20in. cylinder, and 36in. stroke.

The above Engines are quite new, of superior manufacture and finish, and are to be sold at very low prices.

Apply to PAGE and CAMERON, 64 Old Broad-street, London, E.C. (284)

CONDY'S PATENT FLUID, or NATURAL DISINFECTANT.

Not only Deodorizes but Disinfects perfectly, and destroys for ever the cause of infection.

Is not poisonous, as it may be used to purify water. Evolves no noxious or unpleasant gas. Cannot be mistaken for any other fluid, thereby preventing death and disease; and is therefore the best, safest, cheapest, and most pleasant disinfectant ever introduced.

This fluid has been examined and reported upon by the Board of Health, all the most eminent Men and Chemists of the day, in all cases in the most satisfactory manner possible.

The Public are recommended to use this Fluid, properly diluted with water, frequently and habitually in larders, sculleries, dairies, dusty cakes, sick rooms, close places, &c., as it has numerous advantages, and can be used with certain immediate success and perfect safety.

Sold in Quart Bottles, 4s.; Pints, 2s.; Half-pints, 1s. and in bulk, 10s. per Gallon.

Free to Railway on receipt of Order or Stamp. (238)

GOLD and TEETH.—Messrs. BROWNE and CARTWRIGHT, the old-established Surgeon-Dentists, 23 Fleet-street, continue to Stop DECAYED TEETH with their preparation of gold, and to supply their celebrated Teeth, which still stand unequalled among the numerous attempts to imitate them. They are the most clean, wholesome, and natural of any that can be worn. They never change colour or decay, and are fitted without extracting the stumps, or giving the slightest pain, and restoring in every case perfect mastication and articulation. A single tooth, first quality, one guinea; a set, 15 to 18 guineas; second quality—a single tooth, 10s. 6d.; a set, 10 guineas; best American and other third and fourth-class teeth, 4s. per tooth.—22 Fleet-street, near the Temple. (379)

SMALL GAS APPARATUS, WITH FREEDOM FROM NUISANCE.

THE PATENT NATIONAL COAL-GAS APPARATUS,

FOR

Private Residences, Farm Buildings, Churches, Chapels, Railway Station,
And all isolated places not yet lighted with Gas.

The various parts are of the best materials and workmanship, are not liable to get out of order, and can be worked with a small degree of attention by a farm-servant or labourer without materially interfering with his other duties.

Prospectuses with Testimonials, &c., may be had on application to the Proprietors and Manufacturers,

J. T. B. PORTER and CO., Lincoln. (346)

INVENTORS, ENGINEERS, AND OTHERS.

AN Engineer of much Experience can give Assistance in Practically Arranging Inventions, constructing Machinery, Preparing Drawings, Tracings, &c. Address, M. E., 9 Parliament-street, Westminster. (304)

CRAWHALL AND CAMPBELL, MACHINE AND TOOL MAKERS,

AND MILLWRIGHTS,

ELLIOT WORKS, FINNIESTON, GLASGOW.

J. BLOOMFIELD,

MAKER OF

WORKING SECTIONAL MODELS OF STEAM ENGINES, IN WOOD OR METAL, 10½ ST. JAMES'S PLACE, HAMPSTEAD ROAD.

Mr. BLOOMFIELD, having had many years' experience in making models for the late firm of Watkins and Hill, of Charing-cross, can confidently guarantee accuracy of workmanship at very reasonable charges. (329)

GLENFIELD PATENT STARCH, USED IN THE ROYAL LAUNDRY, AND PRONOUNCED BY HER MAJESTY'S LAUNDRESS TO BE THE FINEST STARCH SHE EVER USED.

WHEN YOU ASK FOR

GLENFIELD PATENT STARCH, SEE THAT YOU GET IT,

as inferior kinds are often substituted.

Sold by all Chandlers, Grocers, &c., &c. (75)

TO BRASS-FOUNDERS, ENGINEERS, &c.

THE PATENT PLUMBAGO CRUCIBLE COMPANY having completed the enlargement of their premises, beg to call the attention of all users and shippers of Melting Pots to the great superiority of the PATENT CRUCIBLES, which have been used during the last three years by some of the largest melters in England and abroad. In addition to their capabilities of melting an average of from thirty-five to forty pourings, they are unaffected by change of temperature, never crack, but can be used till worn out, requiring only one annealing for several days' work, and become heated much more rapidly than ordinary pots, effecting thereby a saving of more than fifty per cent. in time, labour, fuel, and waste. The Patent Plumbago Crucible Company also manufacture and import clay crucibles, muffles, portable furnaces, sublimate pans and covers, glass-pots, all descriptions of fire-standing goods, and every requisite for the assayer and dentist. For Lists, Testimonials, &c., apply to Battersea Works, London, S.W. 43

TO SUBMARINE CABLE MANUFACTURERS AND OTHERS.

WELLS & HALL are prepared to Insulate Conductors of all sizes for Submarine Cables or any other purpose where Insulation is required for Telegraphic Communication. The insulating medium is pure India rubber applied by their patent machinery.

HALL & WELLS, Patentees, Steam Mills, Mansfield-street, Borough-road, Southwark, S.E. (362)

TO ENGINEERS, MARINE, LOCOMOTIVE, AND OTHER BOILER MAKERS; IRON-SHIP AND BRIDGE BUILDERS; GAS AND RAILWAY COMPANIES, &c.

WARNE'S NEW PATENT FERRUGINOUS CEMENT PACKING, applicable to Steam, Air, Water, and Gas Joints of all descriptions, Water Tanks and Repairs of Boilers; for Railway purposes, to Chairs and Fish-tail Joints, Turn Tables and Bridge Girders, and to the Construction of Iron Bridges generally, and of Iron Ships.

Among the many important advantages of the PATENT FERRUGINOUS CEMENT PACKING, are, Indestructibility by either Fire, Steam, Water, or Gas; Instant and Ready Application; and great Economy of Time and Labour by its use for Joints, &c., in place of the ordinary Iron Cement. For all Permanent Joints it can be made to set as hard as Iron, and it will Expand and Contract in the same ratio as the metal itself. For all other Joints it can be made sufficiently elastic for the purposes to which India-rubber or other Packing is applied.

WILLIAM WARNE and CO., India-rubber Manufacturers, 9 Gresham-street West, E.C. MILLS—Tottenham, N. (360)

STOVES.—The only Stoves for which a Prize Medal was awarded at the Paris Exhibition in 1855 were WALKER'S PATENT SELF-FEEDING STOVES.

They are acknowledged, after Twelve Years' Experience, to be the most Economical and Perfect Hot-Air Stoves invented for warming Churches, Gentlemen's Halls, Shops, &c. They will burn for Sixteen Hours with one supply of fuel, requiring no attention. These and WALKER'S IMPROVED MASSEY'S SHIP LOGS are to be had of all respectable Ironmongers, or at the Manufactory, 58 Oxford-street, Birmingham; where Prospectuses and Testimonials may be obtained. (378)

BOURDON'S PRESSURE and VACUUM GAUGES.—These instruments may be obtained from JOHN DEWRANCE & Co. (the sole proprietors in Great Britain and the Colonies), 5 Barge-yard, Bucklersbury, London, and from their agents, as follows:—

Manchester—ALLEN, HARRISON, & Co., Cambridge-street; Routledge, New Bridge-street, Salford.
Glasgow—ALEXANDER MITCHELL, 350 Parliamentary-road.
Belfast—GEO. H. STRYFE, York-street Foundry.
Birmingham—ADAM DIXON, 48 Newhall-hill.
Newport, Mon.—H. POOLEY & SON.
Liverpool—MARSDEN, BRO., Argyle-street.
Swansea—J. W. COCKLE, 91 Oxford-street.
Plymouth—J. S. PHILLIPS, Great Western Dock Office.
Newcastle-on-Tyne—GEORGE HABLE, Dean-street. (395)

FULLER BROTHERS, WINDOW BLIND MANUFACTURERS, 45 High-street, Borough (Four Doors from L. B. Railway), London. The Trade supplied on the lowest terms. Well-seasoned Blinds for Exportation. Orders punctually attended to. (325)

BIRMINGHAM WAGGON COMPANY (LIMITED) has RAILWAY WAGGONS for HIRE. Apply to the Secretary, 3 Newhall-street, Birmingham. (276)

BODMER'S PATENT SAFETY VALVE.

—In this Safety Valve the force which raises the cap (a) is derived from the steam pressure exerted upon a column of water, admitted from the boiler through the pipe (b), and is therefore quite independent of the steam which is about to escape. The valve is consequently exceedingly sensitive, and capable of opening to the full extent of its area, especially in the case of a sudden accumulation of steam from whatever cause.

For further information apply to Messrs. R. & L. R. BODMER, 2 Thieves' Inn, Holborn, or to Mr. WM. RUTLEDGE, New Bridge Foundry, Salford, Manchester. (410)

TO INSOLVENT DEBTORS, BANKRUPTS, &c.

MOST VALUABLE ASSISTANCE will be rendered to persons in the above position; or to such as may be desirous of arranging privately with Creditors. There are thousands of persons who have struggled long against the force of misfortune, but few are aware that by a recent Act all small traders owing debts not exceeding £300, can be entirely raised from their difficulties, in all cases without imprisonment; and, if necessary, cash advanced for the above purpose.

Country Insolvent cases attended to immediately. No charge for consultation. The strictest secrecy may be relied on. Address, post paid, to Mr. E. WURR, 6 Essex-street, Strand. (369)

TO ORNAMENTAL IRON FOUNDERS, AGRICULTURAL ENGINEERS, AND OTHERS.

THE

POCKET STEREOSCOPIC PANORAMA,

FOR THE

Exhibition of Series of Stereoscopic Views, will be found the most convenient mode of exhibiting Ornamental Designs and Agricultural and other Machinery which has yet been introduced. Those possessing Stereoscopic Pictures of their Manufactures are invited to inspect samples at

P. C. LAMBORN'S, 85, King William-street, City. (345)

TO ENGINEERS & MANUFACTURERS.

—INDIA-RUBBER WASHERS, Valves, Engine Packing, Fire-engine and Factory Hose-pipes, Gas Tubing, &c.

JAMES LYNE HANCOCK, Vulcanized India-Rubber Works, Goswell-mews, and 8 Goswell-road, London, E.C. (258)

THORLEY'S FOOD FOR CATTLE.—Every person having an interest in domestic or farm animals should obtain a supply of this celebrated and economical food, which will prove invaluable during the approaching season. For keeping horses in good condition, it is unequalled. Pigs fatten with surprising rapidity upon it, and their flesh increases in flavour and value. Cowkeepers will find great advantage in the increased quantity and improved quality of the milk during its use. All animals are benefited by it. A pamphlet on this interesting subject, accompanied by Testimonials from the principal Nobility, Gentry, and Agriculturists, forwarded on application. In Casks containing 448 Feeds (Measures enclosed). Price 50s., carriage paid to any Railway Station in the United Kingdom. Post Office Orders payable to JOSEPH THORLEY 77 Newgate Street, London.

N.B.—The public are cautioned against being imposed upon by worthless imitations. (132)

AGRICULTURAL AND GENERAL ENGINEERS,

And Manufacturers of Portable and Fixed Steam Engines.

Combined Threshing Machines, which dress the corn ready for market at one operation. Grinding Mills, Saw Benches, Pumps for Irrigation and Mining purposes, with all necessary gearing for being driven by steam power. Full particulars and estimates given on application to the above address.

C. S. and Co.'s PORTABLE STEAM ENGINES are adapted for every purpose to which steam-power can be applied. When intended for winding, they are fitted with reversible link motion and winding gear. They are easy of removal, as may be seen by the engraving, and can be set to work immediately on arrival.

C. S. and Co. are now doing an extensive foreign and colonial business, and are prepared to send off engines and machinery of the before-mentioned kinds in a few days from the date of order. They would also call attention to the important reduction in prices made for the new year.

For Exportation.—The above can be obtained through British Merchants, Shippers, and Colonial Agents.

FOWLER'S PATENT STEAM PLOUGH.

ENGINES purchased for Steam Ploughing can also be used for any other operation the Farmer may wish. They are all made to move themselves by Steam from field to field, or place to place, requiring but one or two horses in the shafts to steer them. The Ploughs are so constructed as to be adjusted to any width of Furrow, and they can also be used as a Subsoiler, Trenching-Plough, and Scarifier.

The above is a Cut of Fowler's Engine, Windlass, and Water-Cart.

For further particulars, Illustrated Catalogues, and Prices, apply to
JOHN FOWLER, JUN., 28 CORNHILL, LONDON, E.C.

THE LONDON
WARMING AND VENTILATING COMPANY,
(LIMITED.)

26 GREAT GEORGE STREET, Westminster, S.W.

(MANAGER—MR. WOODCOCK.)

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plan successfully used during the last five years by Mr. Goldworthy Gurney in both Houses of Parliament.

Steam, Hot-water, Gas, and in open or enclosed fireplaces, Coal and Coke are equally available for the process.

The cost is less and the effect greater than that of any other known means.

The Horticulturist will find herein an instrument of new and important powers.

The apparatus may be seen in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and in many churches and other buildings.

Particulars and Testimonials forwarded on application.

IMPORTANT TO MANUFACTURERS
MILL OWNERS, &c.

GUTTA PERCHA MILL BANDS.

THE GUTTA PERCHA COMPANY beg to state that the increasing demand for the Gutta Percha Strapping for Driving-bands, Lathes, &c., fully justifies the strong recommendations they have everywhere received.

Their durability and strength—permanent contractability and uniformity of substance—their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water—and the facility with which the only joint required can be made in bands of from 200 to 300 feet long—render them superior to leather for almost all working purposes, and decidedly more economical.

TESTIMONIALS.

IMPORTANT ANNUAL SAVING.

From TRUMAN, HANBURY, BUXTON, & Co., Brewery London.

"In reply to your inquiry, we have much pleasure in bearing our testimony to the advantages, both as regards economy and saving of time, effected by the use of your Patent Gutta Percha Bands in lieu of Leather Straps. The stoppage of one portion of our works through the failing of the leather strap used to be of daily occurrence—but with this annoyance we are now never troubled. We have had these straps in operation for nearly three years, and are assured by our Engineer that they effect a saving to us of at least THIRTY POUNDS a year."

From JAMES ABERNETHY & Co., Fury Hill Foundry Aberdeen.

"We have now had Gutta Percha Bands working here for three years. One of them has been driving the fan blast for our smith's shop for all that time, and for anything we see, may drive it as long again. The speed of the fan is but 1,200 per minute. We have used them with complete satisfaction, driving circular saws, and in some cases where leather bands would have been quite inapplicable from damp. We have uniformly endeavoured to have the drums and pulleys so proportioned to the strain, as that there is no chance of the band slipping; and with this precaution, and taking care in using cross bands that they do not rub, we are quite satisfied that they are superior in every respect to leather—stronger at the same weight, and keeping quite straight in working—requiring no lacings, and very seldom any repairs."

WATER POISONED BY LEADEN PIPES.

The above engraving represents accurately a section of a leaden pipe, which was employed for a short time in conveying water from a well on the grounds of Mr. Dick, of Bonchurch, Isle of Wight.

POISONED WATER PREVENTABLE
BY THE USE OF GUTTA PERCHA TUBING.

The Gutta Percha Company have been favoured with the following letter,

From Dr. MURRAY, Hull.

"It is impossible to conceive of anything more injurious or destructive to the health of the community than the use of leaden pipes for the conveyance of water. The poisonous salts of lead thereby communicated are most insidious and subtle. I hail with gratitude the substitution of Gutta Percha Tubing. I have had the leaden pipe of my own house removed, and its place supplied with one of Gutta Percha Tubing. Nothing can be better. I have also recommended it to others, who have adopted the expedient."

A variety of Gutta Percha Articles, such as Mill Bands, Tubing, Sheet, Soles, Pump Buckets, Bosses, Union Joints, Bottles, Bowls, Flasks, Curtain and Cornice Rings, Solid Frames, Galvanic Batteries, &c., &c.

MANUFACTURED BY THE

Gutta Percha Company, Patenters,

18 WHARF ROAD, CITY ROAD, LONDON,

AND SOLD BY THEIR

WHOLESALE DEALERS IN TOWN AND COUNTRY.
